In addition to the check made at the accident scene to determine the role played by physical features and traffic conditions in the cause of the accident, inquiry should be made of the State Police, Motor Vehicle Department or Highway Department, or the appropriate municipal agency to ascertain the number, kind and frequency of accidents which have occurred at, or in the immediate vicinity of the accident scene. If the necessary records can be obtained or reviewed, an analysis should be made to determine the character of previous accidents with respect to the consequences (fatalities, injuries, property damage), the apparent cause (e.g. speed, inadequate sight distance, improper access from the property frontage) and the nature of the accidents, (collision, ran off road, etc.).

The fleet safety representative should also make a check of traffic conditions at the site. To be of maximum value, such checks should be on a day when traffic conditions are comparable and at the time at which the accident occurred plus an hour before and after. If possible, official traffic counts for the area should be obtained and studied.

The effects of existing traffic controls, adherence to speed limits, operating habits of passengers, pedestrians and other pertinent circumstances should be noted by observation.

Any pattern of accidents or hazardous conditions revealed by such a study of the scene may serve as the basis of discussion with the appropriate authorities leading to the correction of the hazards noted. Such analysis may also enable the development of information to be given drivers concerning accident hazards in the area.

THE VEHICLES

Investigation should be made to determine the extent to which the mechanical condition of each vehicle involved may have been a causative factor in the accident. The most comprehensive investigation of this nature can be developed

with respect to the fleet's own equipment involved. However, the condition of other vehicles involved should be checked as thoroughly as possible.

If it is found necessary or desirable to make tests to determine the extent to which mechanical defects may have been a factor in an accident, the tests should be conducted in private.

If defective parts are found or suspected to be a contributing factor to the accident, laboratory analysis of the vehicle have occurred at, or in the immediate vicinity of the accident scene. If the necessary records can be obtained or reviewed, an analysis should be made to determine the character of previous accidents with respect to the consequences (fatalities, injuries, property damage), the apparent cause (e.g. speed, inadequate sight distance, improper access from the property frontage) and the nature of the accidents, (collision, ran off road, etc.).

The fleet safety representative should also make a check of traffic conditions at the site. To be of maximum value, such checks should be on a day when traffic conditions are comparable and at the time at which the accident occurred plus an hour before and after. If possible, official traffic counts for the area should be obtained and studied.

The effects of existing traffic controls, adherence to speed limits, operating habits of passengers, pedestrians and other pertinent circumstances should be noted by observation.

Any pattern of accidents or hazardous conditions revealed by such a study of the scene may serve as the basis of discussion with the appropriate authorities leading to the correction of the hazards noted. Such analysis may also enable the development of information to be given drivers concerning accident hazards in the area.

THE VEHICLES

Investigation should be made to determine the extent to which the mechanical condition of each vehicle involved may have been a causative factor in the accident. The most comprehensive investigation of this nature can be developed

D. Exhaust Leakage

(1) Check exhaust system for evidence of leakage if possible.
(2) If leakage is suspected determine effects on drivers, passengers, or others from clinical records. Blood samples taken from survivors soon after exposure will indicate extent of carbon monoxide absorption. Post mortem blood samples for the same purpose may be taken from those killed.
(3) Assistance in making tests for carbon monoxide in vehicles may sometimes be obtained from public health officials. Such assistance may also be secured from the insurance companies or independent testing agencies. In making tests, care must be taken to safe-guard test personnel. Vehicles should not be operated except when tests are in progress. If test vehicles must be operated under their own power, adequate ventilation must be assured.

E. Stopped Vehicles

(1) Determine why the vehicle was stopped where the accident occurred.
(2) If driver was making a traffic stop, find out if the stop was made in a proper manner and if stoplights were functioning.
(3) Ascertain how long vehicle was stopped prior to accident.
(4) Did driver stop in the safest practicable location? If vehicle was stopped for a protracted period, determine whether or not emergency warning devices were properly used, or if their use was desirable, even though not required by law.
(5) If vehicle was stopped because of mechanical defect, find out exact nature of defect and determine whether or not it contributed directly to the accident.
(6) If vehicle was disabled, find out what action driver took about reporting delay, attempting to make repair, or obtaining other assistance.

F. Other Mechanical Defects

(1) Examine vehicles involved in accidents to determine all other processing conditions which may have contributed to the cause of the accident such as: inoperative lights; defective coupling devices; structural weakness; overloading; defects in engine and drive line; defective tires; and any others.
(2) Use care in distinguishing between parts damaged in the accident and those which are found to have been defective before the accident. A "fatigued" part can generally be reported by the fact that only a part of the break in it shows as new.

DEALING WITH WITNESSES

The greatest volume of information about an accident traditionally comes from witnesses and their statements can be of extreme importance, both in an investigation to determine the cause of the accident and in legal action arising out of the accident. Because witnesses are human and subject to human fallibilities and foibles, great care must be encorcized in all dealings with them. It is in this area of accident investigation, perhaps more than in any other, that the closest cooperation must exist between the truck fleet and its insurance carrier. First of all, there must be basic agreement as to whether or not safety representatives of the fleet should contact witnesses or the extent to which such contacts can be properly made. Then, some carrier management should solicit the cooperation of its insurance carrier in giving the necessary instruction to the fleet safety representatives in dealing with witnesses.

In seeking out and interviewing witnesses, the fleet safety representative should use the following points for guidance:

(a) Sources of Witnesses

(1) The driver's report of the accident.
(2) Newspaper accounts of the accident.
(3) Canvassing of buildings, stores or shops near the accident scene.
(4) Operators and employees of garages, service stations, etc.
(5) Other insurance companies (insurance company, etc.)
(6) Police reports.
(7) Other witnesses.

(b) Dealing With Witnesses

(1) Show courtesy and consideration whether the witness is friendly or hostile.
(2) Initially allow witness to tell his own story in his own way without interruption of details later.
(3) No attempt should be made at coercion.
(4) Interview each witness separately.
(5) Never reveal the name or testimony of one witness to another. Stories of witnesses may be compared and checked for discrepancies but extreme care must be used in checking out discrepancies.
(6) Discount hearsay. Information recounting what has been told to witness by others is principally useful for locating other witnesses and may be of use in cross-checking information.
(7) Endeavor to get a signed statement from each witness.

(c) Evaluating the Witness and His Testimony.

The credibility of each witness has a major influence on the value of his testimony to the investigation. The following factors are listed to help the fleet investigator more accurately assess the credibility of witnesses.

(1) Intelligence - ability to observe and remember.
(2) Training - whether or not previous experience specially qualifies witness.
(3) Temperament - calm or excitable - logical or disjointed, etc.
(4) Physical characteristics - eyesight, hearing, perceptional keenness.
(5) Reputation - for truth and sobriety - status in society.
(6) Demeanor - Straightforward or evasive.
(7) Bias
(i) Money interest in outcome.
(ii) Malice against one or another of interested parties.
(iii) Marital or blood relation to one or another.
(iv) Fear of incrimination
(8) Admissions against interest - more credible than others.
(9) Fairness - apparent desire to be frank and open.
(10) Vantage point - position with relation to accident and distance therefrom.

PREPARING THE INVESTIGATION REPORT

Accident Reporting

Each motor carrier will have to determine how many copies of the accident report are necessary and what disposition will be made of them.

Organization of Report

(a) Cover page
(b) Summary
(c) Brief introduction
(d) Description of division or terminal area
(e) Location and description of roadway or other place of occurrence of accident
(f) Diagram preferably at least roughly to scale
(g) Narrative description of accident
(h) Complete identification and description of vehicles involved
(i) General condition of vehicles and conditions related to accident
(j) Discussion of driver or drivers
(k) Summary of evidence
(l) Discussion
(m) Conclusions
(n) Violations involved - of Motor Carrier Safety Regulations, Revised, or state law or regulations; of company rules; of good sense and sound judgment.
(o) Recommendations
(p) Signature and title of investigator
(q) Exhibits - Matters of the type which are brought to the knowledge of management but are not considered to be a part of the report or permanent file, such as, except insofar as management decrees.

Following, is an elaboration of some of the items above listed.

Item (b), Summary, should include:

(1) Name, address, and docket number of other motor carriers involved, if any were involved (if a leased operation, like information concerning the lessor)
(2) Motor carrier's driver - name, address, and age
(3) Other participants - names and addresses
(4) Date and time of occurrence of accident
(5) Weather and road conditions (verify with Weather Bureau)
(6) Location of accident - city, state, highway number of nearest city
(7) Other motor carrier's vehicle-type, Interstate Commerce Commission identification and State license plate numbers.
(8) Types of other vehicles involved
(9) Speeds of vehicles involved.
(10) Result of accident, including number of persons killed, number injured, and the total amount of property damage.

Item (f) Diagram

Preliminary sketch should be made at the scene of the accident which should include all dimensions necessary to the reproduction of the sketch to scale. Trace path of vehicle, show point of collision, distance traveled after impact took place, warning signs and whether or not of reflector type. Show lanes, adjacent shoulders, buildings, walls, shrubbery, trees, signboards, embankments, ditches, and guard rails. Indicate length and percent of grades and direction thereof, and length of curves and degree of curvature, and amount of super-elevation, if any. A

completed diagram, reasonably to scale, should accompany the report. Locate on the diagram the approximate position of all eyewitnesses to the accident who were outside the vehicle.

Item (1) Conclusions

Support all conclusions by concrete reference to evidence, stating names of witnesses, designating records, or other evidence relied upon. Refer to the exhibit numbers in which the supporting matter may be found.

Deductions from evidence are necessary in certain cases and, in some instances, speculation, or reconstruction along the most plausible lines of reasoning, must be relied upon when sufficient evidence is not available for the establishment of definite conclusions. When unavoidable, these must suffice. However, it should be made plain that such is the case, and such deductions, speculations, or reconstructions must be so identified.

Item (0) Recommendations

Because the prevention of future accidents is a primary objective of accident investigation by the motor carrier, recommendations, based on the conclusions reached in the investigation, are a vital part of the report. While the widest latitude should be allowed in the making of recommendations, they are restricted, for practical purposes, to matters which are adequately supported by the facts uncovered in the investigation and to those changes which are feasible in the light of existing conditions. General areas in which recommendations may be made, include:

(1) Disciplinary action - complete review
(2) Training or re-training of drivers
(3) Revision of personnel policies affecting selection, training and supervision
(4) Revisions of maintenance practices and maintenance schedules
(5) Revisions of operating practices and rules.
(6) Cooperation with appropriate state and local authorities working toward the correction or alleviation of physical hazards at accident scenes.
(7) Cooperation with equipment manufacturers to correct inherent hazards found to exist in vehicles.

Item (p) Exhibits

The exhibits should be separate from the main body of the text of the report and should have cover page listing and identification of the exhibits either by letter or number, as convenient.

Completeness and Clarity

Except as it may become necessary to interweave the various component parts of the report under the captions, "Conclusions," Recommendations" or "Discussion," the subject matter under the various other captions should be amply set forth under each caption and then dropped, so that the report will not be rambling and discursive. Additional captions or subcaptions may be supplied as desired.

The completed report should be critically examined to assure that there is completeness of coverage and clarity of expression and that all statements are substantiated to as great an extent as the available facts warrant. Before final completion of the report, it should be read to reassure the investigator that all questions as to the "who, how, what, why, when, and where" involved are fully and completely answered.

Where information is complete concerning a given accident except for one or two items, it is suggested that the report be submitted with appropriate notation to the effect that a supplementary report will be rendered, giving the approximate date at which such report may be expected. Any such item or items should not be such as would effect the principal conclusions or recommendations contained in the report even though additional recommendations may be warranted thereby.

AFTER THE INVESTIGATION

Accident investigation is not an end in itself. It is the objective of this manual to provide guidance for fleet safety men in the better investigation of accidents so that their causes can be determined and effective steps can be taken toward the prevention of future accidents. If this objective is to be attained in any degree, it is essential that necessary follow-up measures be taken based on the results of the investigation.

If recommendations are made as the result of an accident investigation, it is the responsibility of the fleet safety department to present them to management. The adequacy of the investigation is likely to have an important influence on the kind of case which can be presented to support any needed changes in operating practices in the fleet. Once approval for changes has been secured, it becomes management's job to see that they are carried out through education and enforcement.

When vehicle condition or design is a factor, the safety department should work with the fleet's own maintenance department, or with vehicle manufacturers to correct basic problems. In other cases, the safety man must work with the fleet's customers to seek correction of problems which require shipper and receiver cooperation for soltuion.

Where a solution appears to lie in the fields of highway or traffic engineering, the safety man is the logical liaison with the proper governmental agencies.

Constructive accident investigation must always work toward the avoidance of future accidents.

MESSAGE TO THE INSTRUC

Automotive Industries Occupations include those clusters of occupations repair of all types of automotive vehicles. Employment possibilities exist to those requiring a high degree of technical skill and knowledge.

Automotive Industries Occupations are classified into Automotive Servic motive Service deals with the general maintenance and repair of the systems automobile. Auto Damage Correction deals with the appearance of the vehicle glass, fabric, and finish. Automotive industries also require support occup business, sales, stock management, and other related areas.

This publication deals with Auto Damage Correction Occupations and foll steps necessary to enter the industry. It is designed to help instructors c body of knowledge and experiences that lead to the development of salable sk levels of complexity. It does not suggest a course of study, but rather an suggestions for use in developing a vocational program to prepare youths and suggest breadth of coverage of all fields, followed by depth of specializati

The instructional materials are divided into Topics, Concepts, Teaching reflect the services to be performed at each level. Concepts refer to the theory which relate to the services. Teaching Suggestions provide methods tions show the salable skills that should be mastered by the student. The of general safety have been left to the discretion of the instructor.

The content is based on the services to be performed and is divided in Body, and Frame. These services are presented on three levels: Basic, Int ment is intended to assist the instructor in selecting content with the app level is in the area of General Services and then into the area of Paint or after the student has had instruction in and developed skills related to Bo

A group may be given the basic material in Paint and Body and then be further work in Paint and the other additional work in Body. The two group the prescribed training. The two groups could be combined again for Frame last section and is contingent upon the completion of the other areas.

JOHN E. WHITCRAFT, *Director*
Division of Occupational Education

MESSAGE TO THE INSTRUCTOR

es Occupations include those clusters of occupations concerned with the maintenance and utomotive vehicles. Employment possibilities exist at all levels ranging from entry jobs h degree of technical skill and knowledge.

es Occupations are classified into Automotive Service and Auto Damage Correction. Auto- h the general maintenance and repair of the systems or groups of component parts in an Correction deals with the appearance of the vehicle and the repair of damaged metal, h. Automotive industries also require support occupations in the related fields of anagement, and other related areas.

als with Auto Damage Correction Occupations and follows, as closely as possible, the actual the industry. It is designed to help instructors of auto damage correction select the periences that lead to the development of salable skills required for entry at various t does not suggest a course of study, but rather an alinement of content and teaching eveloping a vocational program to prepare youths and adults for employment. It does age of all fields, followed by depth of specialization in any one area.

aterials are divided into Topics, Concepts, Teaching Suggestions, and Applications. Topics be performed at each level. Concepts refer to the principles, fundamentals, and trade he services. Teaching Suggestions provide methods of presenting the material and Applica- kills that should be mastered by the student. The use of basic hand tools and the teaching een left to the discretion of the instructor.

d on the services to be performed and is divided into the areas of General Services, Paint, services are presented on three levels: Basic, Intermediate, and Advanced. This arrange- st the instructor in selecting content with the appropriate depth or emphasis. The entry General Services and then into the area of Paint or Body. Frame should be undertaken only d instruction in and developed skills related to Body work.

n the basic material in Paint and Body and then be divided into two sections with one taking d the other additional work in Body. The two groups could be interchanged at the end of The two groups could be combined again for Frame work. Customizing is suggested as the ingent upon the completion of the other areas.

GENERAL SERVICES

aintenance and Cleanup Services

GENERAL SERVICES - *Maintenance and Cleanup Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Introduction to services	Job opportunities in maintenance and clean-up services	Discuss methods of securing a job.
		Importance of human relations	Discuss methods of developing good human relations on the job
			Demonstrate basic tools and equipment related to maintenance and cleanup services.
	Maintaining upholstery and carpets	Types of vacuum cleaning units	Demonstrate various types of vacuum cleaning units for automobiles.
		Types of upholstery and carpet cleaners	Discuss selection of upholstery and carpet cleaners for specific work and material.
Basic		Types of stains and methods of removal	Discuss stains and methods of removal from upholstery and carpets.
		Composition of dyes	Explain importance of following manufacturers' directions for dyeing upholstery and carpets.
	Preserving finishes	Types of detergents for washing automobiles	Discuss types of detergents used for washing an automobile.
		Types of solvents	Discuss function of solvents.
		Composition of compounding materials	Explain use of compounding materials.

leanup Services

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
ortunities in ance and clean- ices	Discuss methods of securing a job.	Role play situations involving job interviews
nce of human ns	Discuss methods of developing good human relations on the job.	Role play situations involving typical person-to-person problems
	Demonstrate basic tools and equipment related to maintenance and cleanup services.	Perform basic maintenance and cleanup operations
f vacuum cleants	Demonstrate various types of vacuum cleaning units for automobiles.	Vacuum upholstery and carpets
f upholstery and cleaners	Discuss selection of upholstery and carpet cleaners for specific work and material.	Clean upholstery and carpets with detergents
f stains and of removal	Discuss stains and methods of removal from upholstery and carpets.	Remove stains from upholstery and carpets
tion of dyes	Explain importance of following manufacturers' directions for dyeing upholstery and carpets.	Dye upholstery and carpets
f detergents hing automobiles	Discuss types of detergents used for washing an automobile.	Wash automobiles
f solvents	Discuss function of solvents.	Remove tar and grease from automobiles
tion of compound- erials	Explain use of compounding materials.	Compound finishes

2262

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTION
		Types of chrome cleaners	Discuss use of chrome cl
Basic	Cleaning bodies and frames	Types of steam and chemical cleaning equipment used in the automotive industry	Demonstrate steam and ch cleaning equipment.
	Painting (brush applications)	Types and purposes of finishing materials	Discuss types and uses o ous paint materials.
			Demonstrate painting a m a tire.
			Demonstrate painting an compartment.
			Demonstrate painting an carriage.
Intermediate	General service procedures to be drawn from the basic levels of paint, body, and frame		Discuss, demonstrate, or any required service tha listed under paint, body frame.

GENERAL SERVICES - *Maintenance and Cleanup Services*

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
pes of chrome eaners	Discuss use of chrome cleaners.	Polish chrome parts of automobiles
pes of steam and emical cleaning uipment used in the tomotive industry	Demonstrate steam and chemical cleaning equipment.	Clean component parts with steam and chemicals
pes and purposes of nishing materials	Discuss types and uses of various paint materials.	
	Demonstrate painting a mat and a tire.	Paint mats and tires
	Demonstrate painting an engine compartment.	Paint engine compartments
	Demonstrate painting an undercarriage.	Paint undercarriages
	Discuss, demonstrate, or explain any required service that is listed under paint, body, or frame.	

GENERAL SERVICES - *Maintenance and Cleanup Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTION
	Servicing used automobiles	Types and functions of servicing units	Describe function of var types of servicing units
			Demonstrate methods of: Checking fluid levels Charging a battery Replacing a wiper blad Repairing a tire
Advanced	Managing and supervising auto service shops	Personnel management and training	Discuss techniques of su vising workers.
			Explain importance of gi clear, concise direction
		Types of required forms and records	Discuss use of such reco sales, purchases, invent and tax.
		Types of financial responsibilities	Discuss and show samples purchasing and billing procedures and credit references.
			Discuss payroll requirem
			Explain various governme regulations affecting a business.
			Discuss advantages and d advantages of affiliati local collection agencie

2265

and Cleanup Services

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
ypes and functions of ervicing units	Describe function of various types of servicing units.	Use servicing units to check component parts
	Demonstrate methods of: Checking fluid levels Charging a battery Replacing a wiper blade Repairing a tire	Prepare automobiles for delivery by: Checking all fluid levels Charging batteries Replacing wiper blades Repairing tires Cleaning inside Washing and polishing
ersonnel management nd training	Discuss techniques of supervising workers.	Supervise personnel
	Explain importance of giving clear, concise directions.	Train personnel
ypes of required forms nd records	Discuss use of such records as sales, purchases, inventory, and tax.	Keep such records as sales, purchases, inventory, and tax
ypes of financial esponsibilities	Discuss and show samples of purchasing and billing procedures and credit references.	
	Discuss payroll requirements.	
	Explain various government regulations affecting a business.	
	Discuss advantages and disadvantages of affiliating with local collection agencies.

PAINT - *Refinishing Services*

LEVEL	TOPICS	CONCEPTS	TEACHING
Basic	Introduction to services	Types and purposes of refinishing materials	Explain types refinishing m Discuss tools materials, an refinishing.
		Purpose of color codes	Discuss color manufacturers Show location identificati
	Preparing surfaces for refinishing	Methods of preparing surfaces for refinishing	Demonstrate surface for
Intermediate	Refinishing spots and panels	Methods of duplicating original finishes	Demonstrate spot (touchu Demonstrate methods of m color lighte Demonstrate Demonstrate panel.
		Methods of applying compounds and polishing finishes	Demonstrate and polishin

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
es and purposes of inishing materials	Explain types and purposes of refinishing materials.	
	Discuss tools, equipment, materials, and procedures for refinishing.	Use basic refinishing tools, equipment, and materials
pose of color codes	Discuss color codes used by manufacturers.	Select correct colors according to codes
	Show location of a paint identification plate on vehicle.	Select correct colors for specific vehicles
hods of preparing faces for refinish-	Demonstrate preparation of a surface for refinishing.	Remove old paint and clean areas to be refinished
		Mask off areas
		Apply primer
hods of duplicating ginal finishes	Demonstrate how to refinish a spot (touchup).	Refinish spots (touchup)
	Demonstrate gun techniques and methods of making a metallic color lighter or darker.	Match metallic colors
	Demonstrate blending techniques.	
	Demonstrate refinishing a full panel.	Refinish full panels
hods of applying pounds and polishing nishes	Demonstrate applying a compound and polishing a finish.	Apply compounds and polish finishes

2270

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTION
Intermediate		Methods of computing time and materials for refinishing panels	Show method of computing and materials for a spec job.
	Refinishing entire vehicles	Composition of refinishing materials	Discuss composition of r ing materials.
		Procedures for refinishing entire vehicles	Demonstrate procedures f refinishing an entire ve
		Match colors using formulas	Demonstrate use of formu equipment for matching c
Advanced			Demonstrate matching a s color.
		Use of stripe as a decoration	Discuss various types of striping materials.
			Demonstrate procedure fo striping a vehicle.
		Methods of computing time and materials for complete refinish jobs	Discuss materials requir a complete refinish job.
			Explain how preparation affect time required for different jobs.

4TSS2271

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
thods of computing e and materials for finishing panels	Show method of computing time and materials for a specific job.	Figure cost of time and material for specific jobs
position of refinish- materials	Discuss composition of refinishing materials.	
cedures for refinish- entire vehicles	Demonstrate procedures for refinishing an entire vehicle.	Refinish entire vehicles
ch colors using mulas	Demonstrate use of formulas and equipment for matching colors.	
	Demonstrate matching a specific color.	Match colors to order
of stripe as a oration	Discuss various types of striping materials.	
	Demonstrate procedure for striping a vehicle.	Stripe lines on vehicles
hods of computing e and materials for plete refinish jobs	Discuss materials required for a complete refinish job.	Compute time and materials for complete refinish jobs
	Explain how preparation needs affect time required for different jobs.	

PAINT - *Stencil and Decal Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGEST
Basic	Introduction to services	Use of stencils and decals for identification	Discuss use of stenci decals for identifica
		Composition of stencils and decals	Explain manufacture o and decals.
		Surface preparation for application of stencils and decals	Demonstrate surface p for application of a and a decal.
		Types of protective materials for stencils and decals	Discuss composition a protective materials stencils and decals.
			Demonstrate applicati coating materials.
	Applying stencils	Methods of applying stencils	Demonstrate applicati simple stencil.
			Show application of
Intermediate	Applying decals	Design factors affecting decal location	Discuss location of based on principles
		Nature of monograms and decals	Review manufacturer' cations of monograms
			Show application of monograms, and tape

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
Use of stencils and decals for identification	Discuss use of stencils and decals for identification.	
Composition of stencils and decals	Explain manufacture of stencils and decals.	
Surface preparation for application of stencils and decals	Demonstrate surface preparation for application of a stencil and a decal.	Prepare surfaces for application of stencils and decals
Types of protective materials for stencils and decals	Discuss composition and use of protective materials for stencils and decals.	Apply sealers for stencils and decals
	Demonstrate application of coating materials.	Clean and protect existing letters
Methods of applying stencils	Demonstrate application of a simple stencil.	Apply simple stencils
	Show application of letters.	Apply letters
Design factors affecting decal location	Discuss location of decal based on principles of design.	Lay out and position decals
Nature of monograms and decals	Review manufacturer's specifications of monograms and decals.	
	Show application of letters, monograms, and tape stripes.	Apply letters, monograms, and tape stripes

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTI
Advanced	Applying and preserving imitation wood-grained decals	Use of decals to create an effect	Discuss types and uses decals.
			Demonstrate applicatio a wet-type decal.
			Demonstrate alinement
			Demonstrate applicatio a dry-type decal.
			Demonstrate use of a h to soften decal during cation.

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
Use of decals to create an effect	Discuss types and uses of decals.	
	Demonstrate application of a wet-type decal.	Apply wood-grained (wet-type) design to panels
		Apply approved sealer
	Demonstrate alinement of a decal.	
	Demonstrate application of a dry-type decal.	Apply wood-grained (dry-type) design to panels
	Demonstrate use of a heat lamp to soften decal during application.	
		Apply approved sealer

PAINT - *Customizing and Estimating Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
Basic	Introduction to services	Importance of custom work	Discuss the extent of cust work.
			Discuss special materials for custom work.
	Inspecting finishes	Recognitation of defects in finishes	Explain common defects in commercial finish.
	Improving finishes	Development of quality finishes	Demonstrate methods of obt ing a mirror-like finish.
Intermediate	Custom refinishing of panels	Function of special spray equipment	Demonstrate use of specia tools and spray equipment.
			Review manufacturer's dire tions accompanying each p
Advanced	Estimating jobs	Methods of computing estimates for complete custom jobs	Discuss method of making accurate cost analysis.
			Explain that customizing be a cost-plus figure.
	Custom refinishing entire vehicles	Types and use of custom materials for special effects	Demonstrate methods of mi and applying special fini materials.
			Discuss extent of guarant

ONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
ce of custom	Discuss the extent of custom work.	
	Discuss special materials used for custom work.	
ation of in finishes	Explain common defects in a commercial finish.	Determine extent of irregularities in finishes
ent of quality	Demonstrate methods of obtaining a mirror-like finish.	Improve finishes with use of compounds and abrasives
of special uipment	Demonstrate use of special tools and spray equipment.	Refinish areas designated by customers
	Review manufacturer's directions accompanying each product.	
of computing s for complete obs	Discuss method of making an accurate cost analysis.	Itemize cost of parts, materials, and labor to determine total estimate for jobs
	Explain that customizing may be a cost-plus figure.	
d use of custom s for special	Demonstrate methods of mixing and applying special finishing materials.	Refinish entire vehicles as designated by customers
	Discuss extent of guarantee.

Glass Services

Remote Controls, Radiator, and Climate Control Services

Customizing and Estimating Services

BODY - *Sheet Metal and Welding Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Introduction to services	Composition of metals used in the automotive industry	Discuss fabrication of stee its use in the automotive i try.
		Methods of fabricating metal to increase its strength	Explain methods of forming to increase its strength.
			Demonstrate basic sheet-me tools.
Basic	Craning and towing vehicles	Design and construction of craning and towing equipment	Demonstrate procedures for craning and towing a vehic
		Principles of mechanical advantage	Discuss mechanical advanta an aid in doing work.
	Applying undercoat	Purpose of undercoating vehicles	Distinguish between underc and body-deadening materia
			Demonstrate undercoating a vehicle.
	Replacing sheet-metal panels	Design and construction of sheet-metal panels	Demonstrate removal and re ment of a sheet-metal pane
			Demonstrate safe removal a replacement of a fuel tank

Services

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
mposition of metals ed in the automotive dustry	Discuss fabrication of steel and its use in the automotive industry.	
thods of fabricating tal to increase its rength	Explain methods of forming metal to increase its strength.	
	Demonstrate basic sheet-metal tools.	Fabricate simple shapes from sheet metal
sign and construction craning and towing uipment	Demonstrate procedures for craning and towing a vehicle.	Crane and tow vehicles
inciples of mechanical vantage	Discuss mechanical advantage as an aid in doing work.	
rpose of undercoating hicles	Distinguish between undercoating and body-deadening materials.	
	Demonstrate undercoating a vehicle.	Undercoat vehicles
esign and construction f sheet-metal panels	Demonstrate removal and replacement of a sheet-metal panel.	Remove and replace sheet-metal panels
	Demonstrate safe removal and replacement of a fuel tank.	Remove and replace fuel tanks

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Repairing sheet-metal panels	Physical structure and shearing properties of sheet metal	Demonstrate sheet-metal re procedures.
	Applying body filler	Types and properties of body-filler materials	Discuss composition of bod filler materials.
			Demonstrate use of plastic filler and body solder.
Intermediate	Welding and brazing sheet metal	Effects of heat on metal	Demonstrate operation and of an oxyacetylene torch.
		Methods of controlling temperature of metal	Demonstrate brazing.
			Demonstrate use of an asbe heat dam.
			Discuss where and why weld permits are required.
	Repairing bumpers	Process of plating metal	Explain process of plating
		Importance of making accurate measurements when doing repair work	Demonstrate methods of str ening a bumper.
	Repairing trim	Types and purpose of fastening devices and molding clips	Demonstrate various types fastening devices and mold clips.
		Use of templates	Demonstrate making a templ

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
ysical structure and earing properties of eet metal	Demonstrate sheet-metal repair procedures.	Straighten, cut, and fit sheet metal
pes and properties of dy-filler materials	Discuss composition of body-filler materials.	
	Demonstrate use of plastic filler and body solder.	Fill damaged areas with plastic filler and body solder
fects of heat on metal	Demonstrate operation and use of an oxyacetylene torch.	Fuse metal parts using an oxyacetylene torch
thods of controlling perature of metal	Demonstrate brazing.	Braze panels
	Demonstrate use of an asbestos heat dam.	
	Discuss where and why welding permits are required.	
cess of plating al	Explain process of plating metal.	
ortance of making urate measurements n doing repair work	Demonstrate methods of straightening a bumper.	Straighten and repair bumpers
es and purpose of tening devices and ding clips	Demonstrate various types of fastening devices and molding clips.	
of templates	Demonstrate making a template.	Make and use templates

BODY - *Sheet Metal and Welding Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
Intermediate			Demonstrate removal and placement of exterior an rior trim.
		Types of rivets and sheet metal screws	Demonstrate fastening w rivets and sheet metal s
			Show methods of locatin
	Arc-and spot-welding sheet metal	Methods of arc and spot-welding sheet metal	Explain function of ele
			Explain selection of am for different situation
Advanced			Describe types and use welding clamps.
			Demonstrate arc welding sheet metal.
			Demonstrate spot-weldin sheet metal.
	Repairing major body damage	Types of body construction	Explain unit body and c tional body constructio
		Principles of hydraulics	Demonstrate use of spec body equipment.
			Demonstrate repair of a

2284

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
	Demonstrate removal and replacement of exterior and interior trim.	Remove and replace exterior and interior trim using various types of fastening devices and special tools
Types of rivets and sheet metal screws	Demonstrate fastening with rivets and sheet metal screws.	Fasten metal using rivets and sheet metal screws
	Show methods of locating holes.	Remove and replace grilles
Methods of arc and spot-welding sheet metal	Explain function of electrodes.	
	Explain selection of amperage for different situations.	
	Describe types and use of welding clamps.	
	Demonstrate arc welding of sheet metal.	Arc-weld sheet metal sections
	Demonstrate spot-welding of sheet metal.	Spotweld sheet metal sections
Types of body construction	Explain unit body and conventional body construction.	Repair front fender and hood damage
Principles of hydraulics	Demonstrate use of special body equipment.	Repair side body damage
	Demonstrate repair of a pillar.	Repair pillars
		Repair rear body damage

2284

2285

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
Advanced		Design and construction of roof sections	Demonstrate repair of a roof section. Demonstrate removal and replacement of component parts a roof.
		Design and construction of floor sections	Demonstrate repair of a floor section.
		Design and construction of cowl sections	Describe methods of reinforci a cowl section. Demonstrate repair of a cowl section.
		Principles of body alinement	Discuss body alinement procedures. Demonstrate alinement of component body parts.

2286

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
n and construc- of roof sections	Demonstrate repair of a roof section.	
	Demonstrate removal and replacement of component parts in a roof.	Repair roof damage by removing and replacing component parts
n and construc- of floor sections	Demonstrate repair of a floor section.	Repair floor sections
n and construc- of cowl sections	Describe methods of reinforcing a cowl section.	
	Demonstrate repair of a cowl section.	Repair cowl sections
iples of body ment	Discuss body alinement procedures.	
	Demonstrate alinement of component body parts.	Aline body with component parts

BODY - *Electrical Services*

LEVEL	TOPICS	CONCEPTS	TEACHING
	Introduction to services	Basic automotive electrical circuits	Discuss diffe circuits of a
	Note: These services are to be performed on specific body repair jobs		
	Replacing: Headlights	Importance of properly aimed headlights	Explain type lights.
			Demonstrate tion, and ad lights.
Basic	Bulbs	Types and sizes of bulbs	Explain use and sizes of
			Demonstrate ment of vari of bulbs.
	Fuses	Function, types, and sizes of fuses	Explain func sizes of fus
			Point out lo block.
			Demonstrate ment of a fu
	Circuit breakers	Function of circuit breakers	Discuss fun breaker.
			Demonstrate ment of a ci

TASS 2288

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
Basic automotive electrical circuits	Discuss different electrical circuits of an automobile.	
Importance of properly aimed headlights	Explain types and sizes of headlights.	
	Demonstrate removal, installation, and adjustment of headlights.	Remove, install, and aline headlights
Types and sizes of bulbs	Explain use for different types and sizes of bulbs.	
	Demonstrate removal and replacement of various types and sizes of bulbs.	Remove and replace bulbs in component units
Function, types, and sizes of fuses	Explain function, types, and sizes of fuses.	
	Point out location of a fuse block.	
	Demonstrate removal and replacement of a fuse.	Remove and replace fuses
Function of circuit breakers	Discuss function of a circuit breaker.	
	Demonstrate removal and replacement of a circuit breaker.	Remove and replace circuit breakers

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Wires	Principles of a single wire system	Discuss methods of groundin different types of devices.
		Types of wire splices and connectors	Discuss types of wire splic and connectors.
			Demonstrate methods of repa ing electrical wire.
	Mercury switches	Function of mercury switches	Explain operation of a merc switch.
			Demonstrate removal and ins lation of a trunk-light swi
B a s i c	Radio antennas	Purpose of radio antennas	Explain principle of a radi antenna and reasons for usi a shielded lead-in wire.
			Demonstrate removal and ins lation of a radio antenna.
	Horns	Types of horns and horn relays	Demonstrate removal, insta tion, and adjustment of a and a horn relay.
	Electric clocks	Types of electric clocks	Demonstrate removal and ins lation of an electric cloc
	Rear-body lights	Types of rear-body lights	Demonstrate removal and re ment of a taillight, a bac light, and a license-plate light.

2290

NCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
s of a single em	Discuss methods of grounding different types of devices.	
wire splices ctors	Discuss types of wire splices and connectors.	
	Demonstrate methods of repairing electrical wire.	Repair electrical wires
of mercury	Explain operation of a mercury switch.	
	Demonstrate removal and installation of a trunk-light switch.	Remove and install trunk-light switch
f radio	Explain principle of a radio antenna and reasons for using a shielded lead-in wire.	
	Demonstrate removal and installation of a radio antenna.	Remove and install radio antennas
horns and horn	Demonstrate removal, installation, and adjustment of a horn and a horn relay.	Remove, install, and adjust horns and horn relays
electric clocks	Demonstrate removal and installation of an electric clock.	Remove and install electric clocks
rear-body	Demonstrate removal and replacement of a taillight, a backup light, and a license-plate light.	Remove and replace taillights, backup, and license-plate lights

BODY - *Electrical Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIO
Intermediate	Replacing: Starting units	Types of drive belts	Demonstrate removal, i lation, and adjustment belts.
		Types of starting units	Demonstrate operation, installation, and adju a starting unit.
	Generating units	Types of generating units	Demonstrate operation, and installation of a or an alternator.
	Dimmer switches	Types of dimmer switches	Demonstrate operation, and installation of a switch.
	Marker lights	Types of marker lights	Demonstrate removal a lation of a marker lig
	Courtesy lights	Types of courtesy lights	Demonstrate removal a lation of a courtesy
	Electric locks	Types of electric locks	Discuss types of elec ing devices.
			Demonstrate operation and installation of a lock.

2292
1551

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
Types of drive belts	Demonstrate removal, installation, and adjustment of drive belts.	Remove, install, and adjust drive belts
Types of starting units	Demonstrate operation, removal, installation, and adjustment of a starting unit.	Remove and install starting units
Types of generating units	Demonstrate operation, removal and installation of a generator or an alternator.	Remove and install generators or alternators
Types of dimmer switches	Demonstrate operation, removal, and installation of a dimmer switch.	Remove and install dimmer switches
Types of marker lights	Demonstrate removal and installation of a marker light.	Remove and install marker lights
Types of courtesy lights	Demonstrate removal and installation of a courtesy light.	Remove and install courtesy lights
Types of electric locks	Discuss types of electric locking devices.	
	Demonstrate operation, removal, and installation of an electric lock.	Remove and install electric locks

2292
less

0022293

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Replacing:	Types of electrical test equipment	Demonstrate use of electr test equipment.
	Power units	Types of power seat units	Demonstrate operation, re installation, and adjustm a power seat unit.
		Types of power window units	Demonstrate operation, re installation, and adjustm a power window unit.
		Types of power top units	Demonstrate operation, re installation, and adjustm a power top unit.
Advanced	Ignition switches	Types of ignition switches	Demonstrate removal and i lation of an ignition swi
	Safety signals	Types of safety signals	Demonstrate removal and i lation of a safety signal switch.
	Wiper motors	Types of wiper motors	Demonstrate operation, re and installation of a wip motor.
	Instrument lights	Types of instrument lights	Discuss types of bulbs an circuits used for instrum
			Demonstrate removal and i lation of an instrument l
	Automobile radios	Basic shapes and designs of automobile radios and speakers	Explain relationship of s of a radio and component to their location.

2294
VOSS

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
ypes of electrical est equipment	Demonstrate use of electrical test equipment.	Use test equipment to check circuits and units
ypes of power seat nits	Demonstrate operation, removal, installation, and adjustment of a power seat unit.	Remove, install, and adjust power seat units
ypes of power window nits	Demonstrate operation, removal, installation, and adjustment of a power window unit.	Remove, install, and adjust power window units
ypes of power top nits	Demonstrate operation, removal, installation, and adjustment of a power top unit.	Remove, install, and adjust power top units
ypes of ignition witches	Demonstrate removal and installation of an ignition switch.	Remove and install ignition switches
ypes of safety signals	Demonstrate removal and installation of a safety signal and switch.	Remove and install safety signals and switches
ypes of wiper motors	Demonstrate operation, removal, and installation of a wiper motor.	Remove and install wiper motors
ypes of instrument ights	Discuss types of bulbs and circuits used for instruments.	
	Demonstrate removal and installation of an instrument light.	Remove and install instrument lights
asic shapes and designs f automobile radios and peakers	Explain relationship of shape of a radio and component parts to their location.	Remove and install automobile radios and component parts

2294

2295

BODY - *Hardware Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Introduction to services	Types of automotive hardware	Discuss different types hardware used on a vehic
	Replacing: Rearview mirrors	Types of rearview mirrors	Demonstrate attaching a view mirror to a vehicle
	Hubcaps and wheel covers	Operation of gripping devices of hubcaps	Explain purpose of hubca
			Demonstrate replacement hubcap.
	Fuel-tank doors	Principles of inset design	Demonstrate removal and lation or adjustment of tank door.
Basic	Striker plates	Types and designs of striker plates	Discuss function of str plates.
			Demonstrate removal and lation or adjustment of striker plate.
		Types and design of insulators and spacers	Explain use of insulato spacers.
			Demonstrate removal and lation of a bumper stop
	Hood springs and hinges	Principles of leverage	Review principles of me advantage.
			Demonstrate removal, in tion, and adjustment of spring and hinge.

NCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
automotive	Discuss different types of hardware used on a vehicle.	
rearview	Demonstrate attaching a rear-view mirror to a vehicle.	Attach and adjust rearview mirrors to vehicles
of gripping f hubcaps	Explain purpose of hubcaps.	
	Demonstrate replacement of a hubcap.	Remove and replace hubcaps
s of inset	Demonstrate removal and installation or adjustment of a fuel-tank door.	Remove and install or adjust fuel-tank doors
designs of lates	Discuss function of striker plates.	
	Demonstrate removal and installation or adjustment of a striker plate.	Remove and install or adjust striker plates
design of s and spacers	Explain use of insulators and spacers.	
	Demonstrate removal and installation of a bumper stop.	Remove and install bumper stops
s of leverage	Review principles of mechanical advantage.	
	Demonstrate removal, installation, and adjustment of a hood spring and hinge.	Remove, install, and adjust hood springs and hinges

2297

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGESTIONS
	Locking devices - spring type	Types and design of spring-locking devices	Discuss types and design of spring-locking devices. Demonstrate removal, installation, and adjustment of a hood-latch assembly.
Basic	Reveal moldings	Types and design of reveal moldings	Discuss types and design of reveal moldings. Demonstrate removal and installation of a reveal molding.
	Sill plates	Types and design of protective hardware	Discuss types and design of protective hardware. Demonstrate removal and installation of a sill plate.
	Coat hooks	Types and design of convenience hardware	Demonstrate removal and installation of convenience hardware.
	Sun visors	Importance of controlling sun glare	Demonstrate removal and installation of a sun visor.
Intermediate	Replacing:		
	Trunk and door hinges	Types and design of trunk and door hinges	Demonstrate removal and installation of trunk and door hinges
	Trunk torsion rods	Operation of trunk torsion rods	Demonstrate operation, removal, installation, and adjustment of trunk torsion rods.
	Locks	Types and operation of locks	Explain types and operation of locks.

CONCEPTS	TEACHING SUGGESTIONS	APPLICATIONS
and design of g-locking devices	Discuss types and design of spring-locking devices.	
	Demonstrate removal, installation, and adjustment of a hood-latch assembly.	Remove, install, and adjust hood-latch assemblies
and design of l moldings	Discuss types and design of reveal moldings.	
	Demonstrate removal and installation of a reveal molding.	Remove and install reveal moldings
and design of ctive hardware	Discuss types and design of protective hardware.	
	Demonstrate removal and installation of a sill plate.	Remove and install sill plates
and design of ience hardware	Demonstrate removal and installation of convenience hardware.	Remove and install coat hooks
tance of control- un glare	Demonstrate removal and installation of a sun visor.	Remove and install sun visors
and design of and door hinges	Demonstrate removal and installation of trunk and door hinges.	Remove, install, and adjust trunk and door hinges
ion of trunk n rods	Demonstrate operation, removal, installation, and adjustment of trunk torsion rods.	Remove, install, and adjust trunk torsion rods
and operation of	Explain types and operation of locks.	

BODY - *Hardware Services*

LEVEL	TOPICS	CONCEPTS	TEACHING SUGGEST

ABSTRACT - Prepared by experienced supervisors in the area of shorthand instruction, this guide is designed to aid shorthand teachers at all experience levels in planning and conducting high school shorthand programs. The guide is organized in major sections for First Year, Second Year, Third Year, and Special Classes with the first three sections including objectives, classroom activities, instructional techniques, and evaluation, and the specialized course covering: (1) rapid advancement, (2) modified classes, (3) accelerated stenography, (4) Spanish stenography, (5) legal and medical stenography, (6) Gregg shorthand, (7) machine shorthand, (8) speedwriting, and (9) work experience. A section on cocurricular and extracurricular activities and an appendix providing a bibliography, teaching aids and resources, list of commonly misspelled words, various sample schedules and forms for use in electronic laboratories or classrooms, and speed dictation charts are also included. Foreword

This curriculum bulletin, *Shorthand for High Schools,* is designed to provide materials for teachers and pupils in the secondary schools. Included are practices and procedures representing current teaching methodology and contemporary business practices. Specific applications and general principles serve as a guide for the beginning teacher as well as the more experienced instructor. Recommendations are provided to meet the needs of students of differing ability levels and aspirations.

Modern offices function most efficiently with the aid of competent secretaries who serve as major assistants to the busy executive. Commerce and industry flourish through correspondence. Many of the new devices used for transcription and communication depend upon the ability of the trained stenographer.

Shorthand continues to be an important subject in the high school program and is a major interest of many young people preparing for careers in business and industry.

SEELIG LESTER
Deputy Superintendent of Schools

2360

Acknowledgments

This curriculum bulletin, *Shorthand for High Schools,* was developed cooperatively by the Bureau of Curriculum Development, David A. Abramson, Acting Director, and the Bureau of Business and Distributive Education, Norman W. Elliott, Acting Director. Harry E. Wolfson, Assistant Superintendent, cooperated in the preparation of these materials, and Seelig Lester, Deputy Superintendent of Schools for Instructional Services, provided overall direction for the curriculum development program.

The original manuscript was prepared by Florence J. McGill and Esther Sass, Chairmen of Secretarial Studies. Anna K. Schmidt, Chairman, contributed to the development and revision of the materials.

Contributions were made by Seymour Rosen and Abraham Ellenbogen, Acting Assistant Director of the Bureau of Business and Distributive Education. The Standing Committee of Secretarial Studies Chairmen reviewed the material and made suggestions for modifications and additions to the final document.

Daniel A. Salmon, Acting Assistant Director, Bureau of Curriculum Development, served as coordinator of this project. Edythe Kahn, Editor, supervised the printing production. Eleanor Shea edited the manuscript. Ruth Eriksen was responsible for page design and cover.

Introduction

This guide has been prepared by experienced supervisors in the area of shorthand instruction for the purpose of assisting teachers at all experience levels. It seeks to contribute to the resolution of instructional problems of the type most frequently encountered. Essentially, this is a compendium of objectives, teaching aids, devices, techniques, materials, methods, and activities. It will provide the beginning teacher with suggestions for establishing a set of instructional priorities and for planning the daily lesson; and it will serve the experienced teacher as a reference source for acquiring additional approaches that may contribute to motivational impact and to instructional effectiveness.

This guide is organized in major sections for First Year, Second Year, Third Year, and Special Classes. However, a detailed Table of Contents for easy reference will enable the teacher to review a topic as it applies to every level of the course of study.

AIMS

The shorthand program has the following goals:

- To develop a degree of occupational competency which will enable the student to obtain gainful initial employment and a basis for progressive advancement.
- To develop students' ability to take dictated correspondence and to transcribe it in acceptable form.
- To build a broad understanding of modern business procedures and terminology.
- To strengthen the students' language arts skills.
- To acquaint students with the career opportunities available in the business world.
- To develop in the students desirable work habits, attitudes, and ideals essential to the successful performance of the duties of a stenographer and of the broader occupational role.

2364

Since fundamental English skills are essential for successful progress, it is recommended that where there is inadequacy in these skills, the basic two-year course be extended to provide for additional, correlated language arts learning activity. This extension may be in the form of double periods of shorthand in the first or second year of the subject, or in both; or it may extend the basic two-year course to two-and-one-half or three years.

CONTENT

The content of shorthand instruction is based on the principles embodied in the Gregg and Pitman stenography systems, both of which are taught in the New York City high schools. Instruction in machine shorthand and alphabetic shorthand systems is offered in some high schools.

DEVELOPING DESIRABLE ATTITUDES AND TRAITS

The development of desirable attitudes, ideals, and traits of character is a vital part of education. It must be recognized that these personal qualities cannot be taught as directly or measured as readily as technical skills. Nevertheless, this phase of the students' training must not be neglected.

The problem of how to develop these desirable attitudes, ideals, and traits of character can best be handled when there is an awareness and understanding on the part of the teacher of the background and upbringing of his students. In a large city such as New York, the school population is highly heterogeneous in family training and in socio-economic background. Since children bring to school many of their problems and difficulties, the teacher must be alert to accept the students as they are and to work with them to achieve more wholesome and desirable qualities. If the development of proper attitudes, ideals, and traits is to be successful, provision for the development of those qualities must be made in the classroom.

Special mention should be made of the problems of students who have initial difficulties in adjusting to the stenographic course. To avoid discouraging shorthand students during the first term or year of work, it must be remembered that the problems of home and environment are especially important in determining the level of success during this time.

2365

While it is the function of the teacher to help the students develop desirable traits, it is, by the same token, necessary for the teacher to know what qualities he himself should possess to bring about a better adjustment to the initial stages of shorthand learning. Teachers of beginning shorthand students should possess the following attributes:

INTEREST AND UNDERSTANDING

One of the best ways to obtain rapport with the student who is making a poor initial adjustment is to show a genuine interest in his problems, both in and out of school. The child who has been brought up in a home where punishment for any slight wrongdoing is the order of procedure will be reluctant to try something new. This may sometimes explain poor achievement.

ENCOURAGING ATTITUDES

The student with good potential who does poorly in school is in need of constant stimulation. Encouragement begins with faith in the child and a desire to help during the difficult periods of adjustment. Frequent reference to others who have surmounted similar difficulties, both celebrities and peers, is a helpful device. Also helpful is a cheerful attitude on the part of the teacher. Children "catch" enthusiasm and cheerfulness. The teacher who regards his lessons as drudgery will find that he cannot hide this attitude from his students and that they soon begin to assume the same attitude. Together with encouragement in the everyday work of the class should go the development of aspirations for future success. The teacher should constantly relate successful work of the day to successful work on a job.

The occupations of stenographer and secretary should be considered as objectives that can contribute significantly to the upward mobility and raised aspirations of inner-city youth. Therefore full recognition should be accorded to the desirability of encouraging students who have interest and potential that can be developed, to participate in this program. The special needs of these students can be met, by implementing the recommendations contained in this guide as they relate to curriculum practices found on p. 87 and p. 88 and instructional approaches found in the sections on Essentials of Instruction.

PERSONALITY TRAITS

In order to achieve maximum effectiveness in the training of students for stenographic jobs in the business world, the teacher should make it

a practice to include training and experience in the following traits as part of the regular routine of teaching.

Responsibility. The stenographer should carry out to a proper conclusion any job that he assumes. Students must be trained to complete assignments of work on days when they are absent and to accept responsibility for tasks or jobs of a daily, recurring nature.

Initiative. Initiative involves finding ways to handle a problem as well as assuming problems and responsibilities beyond the normal course of activity.

Punctuality. There is a close correlation between the record for punctuality in school and on the job. The teacher should insist that students get to class on time, that they begin work promptly, and that all work be submitted when due.

Courtesy. Many opportunities occur for training in courteous behavior, such as listening quietly while the teacher or another student is talking, not calling out answers, using the words "please" and "thank you" wherever appropriate, etc. Perhaps the best way of instilling courtesy lies in the example set by the teacher.

Getting Along with Others. Implicit in respect for others is the recognition and acceptance of individual differences. The teacher should guide the process so that individual students are not permitted to impose their own likes and dislikes on the rest of the class. He should also be alert to encourage understanding and acceptance of the weaknesses and strengths of individual students or groups of students. The teacher should not permit members of the class to exaggerate or publicize the faults or weaknesses of others in the group. Discussions should be held, when appropriate, on certain undesirable office practices such as gossiping, making derogatory remarks, acting to the detriment of others, and being unwilling to cooperate with others in carrying out a job. The value of a cheerful attitude, enthusiasm, and evenness of disposition should be emphasized in daily classroom routine.

Honesty. We may also interpret honesty as an open-minded acceptance of ourselves. This involves admitting faults and facing situations squarely. Such obvious situations as taking tests are splendid opportunities for building traits of honesty. Other opportunities will arise in connection with discussions of such undesirable practices as writing in textbooks, unauthorized use of longhand keys, and use of longhand in shorthand notes (when specifically prohibited), etc.

2367

Loyalty. The businessman expects his employees to maintain a high degree of loyalty to the firm. Making disparaging remarks about the employer or the firm, revealing company secrets, or spreading gossip about others in the firm are all practices that must be avoided. The discussion of these practices will serve to stress the need for loyalty.

Adaptability. The teacher must make students aware of the need for flexibility in their attitudes by emphasizing the process of continuous change in the business world and developing the willingness to adjust to change.

Personal Appearance and Voice. The first and sometimes decisive impression an employer receives of a prospective employee is his personal appearance and voice qualities. Special attention should be paid to cleanliness of person and of clothing, neatness of hair and the use of subdued makeup. The teacher should at all times be a model in these respects, and should utilize display materials showing correct business attire. The teacher should be on the alert to encourage a well-modulated speaking voice, good posture, and pride in personal appearance.

2368

First-Year Shorthand

SPECIFIC OBJECTIVES

To enable the students to learn the theory of the shorthand system

To enable the students to apply the principles of the system:

- To construct shorthand outlines in conformity with the system of shorthand taught
- To write shorthand fluently and correctly in form, direction, slant, and proportion
- To write short/brief forms, phrases, and basic vocabulary automatically
- To take from timed dictation simple business material, both familiar and unfamiliar, and to read and transcribe it accurately
- To read fluently from shorthand plates and notes.

To develop correct habits of studying shorthand

To develop correct and efficient work habits in using the notebook, in handling materials and in organizing work systematically

To train students to evaluate their performance, to analyze their own work for specific weaknesses, and to apply remedial measures

To build a basic skill in handling the conventions of written English: spelling, punctuation, and meaning of common business terms.

To develop in pupils desirable work habits, attitudes, and ideals essential to the performance of the duties of the stenographer and of the broader occupational role.

2369

CLASSROOM ACTIVITIES

The important elements of good teaching include the proper allocation and the optimum use of time; a simple, clear, step-by-step presentation; sufficient repetition to insure automatization; and an application phase for the new vocabulary.

To maintain and heighten interest the teacher should be familiar with and use a variety of approaches for the various parts of the lesson. The activities listed below are suggested and recommended procedures, by no means all-inclusive, by which a teacher may attain such variety. It would be advisable for the beginning teacher to use these as a checklist to insure that he does vary his procedures. More detailed information relating to these subheadings will be found in the pages that follow.

In addition, the teacher should remember that to stimulate effort the lesson must be paced suitably, and that to challenge attention much of the material reviewed and applied should be timed.

STARTING EACH LESSON PROMPTLY

The teacher must have prepared some form of set classroom activity, known to the students, for the start of each lesson. A student monitor may be assigned to start the activity even before the bell rings. By the time the bell has rung each pupil can therefore be at work. In addition, monitors preassigned should have cleaned, ruled (if desired), and dated the boards.

USING THE HOMEWORK ASSIGNMENT

Reading plate material

Stressing fluency, accuracy, and rapidity of reading
Questioning theory, spelling, and content
Having the class trace during the reading

Reading words or connected material from student's homework notes

Stressing fluency, accuracy, and rapidity of reading

Questioning theory, spelling, and content
Having the class trace or rewrite during the reading on lines or columns provided on the homework paper

Dictating homework material

Previewing difficult outlines and then dictating
Dictating material first and then postviewing troublesome outlines
Dictating at increasing rates of speed
Having students trace over their notes or rewrite during the reading back by other students

Using special stenographic workbooks in which the shorthand outlines are printed and blank lines are provided below the plates

Using records and tapes

READING SHORTHAND PLATES

Reading plate notes from previous lesson
Reading plates of new lesson

DAILY TEST (Optional — Short)

Word Test — limited in length

Based on homework assignment
Based on review of short/brief forms and phrases
Based on specific class needs

These tests should be checked immediately and followed by remedial practice; no more than three minutes need be allowed for the entire procedure.

Dictation Test

Based on homework assignment
Based on material previously covered
Based on new material but including familiar vocabulary

Spelling Test

Taken from homework
Taken from words commonly misspelled on previous tests
Taken from spelling list
Taken from students' lists of personal spelling difficulties

2371

Transcription Test

Based on textbook
Based on homework
Based on open-book dictation and transcribed from the student's own notes

BRIEF FORM, SHORT FORM, AND PHRASE DRILLS

Isolated brief forms, short forms, and phrases

Placing on the board for rapid reading both consecutively and at random
Timing of the reading
Competing of rows and individuals for rapid-reading speeds
Dictating at increasing rates of speed
Dictating of forms without preview, followed by correction and remedial practice
Checking up on how many times a given form may be written in five seconds (or any given unit of time)

Sentences or paragraphs of brief/short forms and phrases

Previewing difficult brief/short forms and phrases, followed by dictation of the material

Dictating brief/short forms and phrase sentences, followed by practice on difficult outlines

Individual practice based on individual difficulties
Class practice on difficult outlines as determined by teacher

Successive dictations at progressively higher speeds
Using brief/short form records and tapes

PRESENTING A NEW PRINCIPLE

Traditional Method
Language Arts Method
Eclectic Method
This presentation phase is an extremely important part of the lesson. See pages 15-16 for a detailed description.

REPETITIVE PRACTICE (Drill)

Spelling phonetically and reading outlines from the board in concert, then individually in consecutive order and at random

35 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

Dictating outlines

Spelling first and then saying word repetitively to set the pace of writing

Consecutively and then at random

Redictating at a faster pace

Oral reading of final dictation

Practicing new outlines, their derivatives *(serve, serves, served),* and word families *(reserve, deserve, observe)*

Practicing with textbook open

Apply material under Dictating Outlines

APPLYING NEW MATERIAL

Using shorthand plates

Reading connected matter

Dictating such material with books open

Oral transcription

Tracing or rewriting during the oral transcription

Redictating with books closed and having students check their work after the dictation

Dictating original material containing words previously practiced in sentences or short letter form

Previewing difficult outlines before dictation

Dictating first then postviewing difficult outlines

Placing material on board as pupils read back for correction and remedial practice

Redictating at higher rate of speed

Redictating at a lower rate for shorthand penmanship control

Initiating new outlines based on principles learned (limited)

CORRELATED LEARNINGS

Spelling, vocabulary, punctuation, content meaning

Preplanned questions asked at suitable times during period

Questions arising from the context interspersed throughout lesson

SUMMARY

Elicit the principle learned with an example given.

Outline the new principles clearly and concisely on board.

Reread new outlines and/or connected material from board.

2372
2373

ESSENTIALS OF INSTRUCTION

CLASSROOM ORGANIZATION

In order to use every minute of the period profitably, as well as to provide a businesslike atmosphere, it is imperative that the teacher establish classroom routines. Some recommended procedures are:

- Appointing monitors to erase and prepare blackboards for the work of the period
- Organizing activities to get students seated and to work immediately

  Practicing review short/brief forms, phrases, or outlines
  Transcribing to longhand from shorthand written at home
  Taking dictation of homework letters from the pupil leader
  Reading by pupils of letters practiced for homework
  Taking dictation from tape or record player

- Setting up definite routines for checking attendance, collecting homework, distributing papers, etc.

CORRECT WRITING AND WORK HABITS

The development of the correct writing of shorthand and of proper work habits is essential and should be stressed from the very beginning. Reminders to the class must be made daily. The teacher must be alert to check for lapses and to require conformance.

Good posture and correct position of hand and arm are important. The students should sit squarely in front of the desk with feet flat on the floor, body bent forward slightly at the hips, back straight, and both forearms on the desk.

Attention must be given to:

Organization of desks — only needed materials to be on pupils' desks

Use of correct tools — correctly lined and ruled notebooks with paper of good quality and well-sharpened pencils or smooth-writing pens

2374

Proper use of tools — lightly held, forward moving pen (with top removed) or pencil — no gripping or extra pressure, no drawing of outlines, no patching or retracing of poorly written outlines, no unnecessary lifting of pen or pencil, no erasing.

Good penmanship — correct proportion, slope, and direction checked by teacher through daily observation and inspection of homework and test papers

Proper use of notebook

- Daily dating of notebook at the beginning of the day's work and at the bottom of the page
- Writing in columns a quarter or a half of the width of the page, on one side only, to the bottom and to the end of the book before reversing
- Gradually moving paper or introducing thumb or finger under the left edge to turn it quickly with free hand
- Indicating end of letter dictated by leaving space or using a significant mark
- Making corrections in shorthand notes by circling errors and rewriting each incorrect or poorly written outline after comparison with the chalkboard or textbook models; no erasing permitted
- Marking notes to show completion of transcription of letter by line drawn through notes
- Indicating place to begin notetaking by rubber band around used pages

Using any pauses to read and edit notes by inserting punctuation, indicating paragraphs, improving outlines, etc.

LESSON PLANNING

A lesson plan is important because it

- Insures the best use of every minute of the class period
- Gives the teacher security and the class confidence
- Enables the teacher to analyze good teaching methods and procedures
- Serves as a basis for evaluation of the lesson and its improvement.

A lesson plan is a flexible guide because it

- Contains all of the essential elements of the lesson
- Includes more material than can be covered in one period
- May be varied as the need arises

2375

May be used as a follow-up for future lessons with proper notations made thereon by the teacher (Notations in the teacher's personal textbook will also prove helpful.)

PARTS OF A LESSON

While the parts of the lesson will vary to conform to the method used by the teacher, each lesson should make some provision for the following:

Aim

This should be:

Specific in terms of the material to be covered
Understood by students
Within the reach of the students
Directed toward the overall objectives of the course
Stated in terms of students' point of view rather than teacher's

Apperceptive base: This should supply the known material from which the new concept can be developed, through one of these procedures:

Contextual material written on the board in shorthand with the key words leading to the new lesson circled, written in colored chalk, and/or isolated

Contextual material stated orally and the key words isolated and written on the board in longhand and/or shorthand

Illustrative words from which the new principle is to be derived, stated orally, and/or written on the board in longhand and/or in shorthand

Motivation

Characteristics

Directly linked to the new lesson
Supplied by pupils when possible
Understood by pupils
Interesting and/or challenging
As short and simple as possible
Varied

2376

Variations in Approaches

Varied approaches capitalize on the motivational elements inherent in a particular method of presentation (see Presentation). The approaches make these methods more effective and interesting because they evoke attention and require active student participation. Their appeal to the imagination and their stimulation of the thinking process help to make the learning process more enjoyable. Once the students' curiosity is satisfied, some of the enthusiasm generated by the approach carries over into the drill period and contributes to automatization of outlines and successful learning.

THE SOUND APPROACH. In this approach the teacher recites three or more words, slightly exaggerating the new sound common to all of them. The students are asked to identify the new sound and to offer additional illustrations.

THE SENTENCE APPROACH may take several different forms. (a) An entire sentence may be written on the board in shorthand, all the outlines being familiar except the one introducing the new device. This outline should preferably come at the end of the sentence, and the context of the sentence should be such as to suggest clearly the new word to be read. (b) The sentence may be written in longhand on the board, with the new outline alone presented in shorthand. (c) Several sentences are recited by the teacher, and only the new outline in each sentence is written on the board.

THE SPELLING APPROACH. In this approach, students are asked to write in their notebooks the longhand spelling of a series of words. The teacher elicits the words and writes them in longhand in a column on the board. The students are asked to identify the common elements in the words. These elements are underscored by the teacher, who then demonstrates how the new words are written.

CONTRAST AND/OR ANALOGY. Students are asked to deduce a new principle from a familiar one, by recognizing similarities which may be based on a partial resemblance; or parallel columns of words written in longhand and in shorthand may be used to facilitate recognition.

THE DIRECT APPROACH is used for teaching brief/short forms and difficult theory concepts, or to save time when there are a

2377

number of new sub-principles to be presented in a particular lesson. This approach is most effective with the language arts method. The teacher writes the first word on the board and reads it; the students may read it aloud three times as the teacher points to it. The teacher now writes the next outline on the board and reads or elicits the word; and the students read it aloud three times as the teacher points to the outline. The teacher then points to the previous outline which is read once by the class. This procedure is repeated until all the important words have been developed. Then concert reading, rapid and random, is followed by individual readings. The success of this method depends on the speed and the intensity of response and the enthusiasm generated.

No approach is limited to a specific principle of theory, although one method may be more successful than another or more desirable in a particular instance. Several different approaches and even methods should be introduced to vary the presentations from day to day.

Presentation

Traditional Method

INDUCTIVE — the new generalization or principle will be elicited from the pupils through:

Sentences containing the new words written on the board in shorthand and read by students through the use of common sense and English and shorthand background

New words are sounded by the teacher, and the class given additional examples

New words are written on the board in longhand and the common sound elicited; examples: *nation, fashion, occasion, extension.* (Differences in longhand spelling should be established.)

DEDUCTIVE — the new generalization or principle is stated by the teacher and illustrated by:

A series of words supplied by teacher and/or pupils and written on board in shorthand

The textbook vocabulary read by the class

Language Arts Method. The teacher does not verbalize rules, but writes, spells, and identifies the new outlines and then has the pupils spell and

2378

read them. With minor variations, the method may be termed the direct method or the functional method. The general characteristics of this method include:

No verbalizing of rules

Spelling and reading of the first new outline by the teacher, followed by spelling and reading of additional examples by students

Developing skill in shorthand reading before writing is begun

Achieving automatization through reading and copying of shorthand plates

Evaluating pupil accomplishment through tests on transcripts (not on isolated outlines)

Providing a longhand key for the pupils

Emphasizing skill-building dictation containing familiar matter until theory is completed

Eclectic Method

The teacher selects from both preceding methods the procedures by which he can best achieve the final goal.

Repetitive Practice

These are activities used in connection with isolated outlines illustrating a principle, a word family, short/brief forms, or phrases. See page 41 for detailed suggestions. Some general procedures are:

Teacher points consecutively, then at random, to outlines on the board, as students spell and say them in concert, then individually

Teacher dictates these outlines

Teacher dictates the outlines followed by including each word in the simplest possible sentence. Example: *"Easy, easy, easy. This is easy."*

Class reads and possibly practices outlines from the textbook

Application

Can the student read and write in context what he has learned up to this point in this lesson? Reading plate notes involving illustra-

2379

tions of the new principle is an effective form of application. Dictating a short letter or sentences using words involving the new principle and previously drilled repetitively (see repetitive practice) is another method of shorthand application. These sentences are read back and placed on the board by the teacher so that the students can then check their work and engage in remedial practice. In first-year shorthand, material given for dictation should generally be checked with the blackboard or textbook.

Repetitive practice (drill) and application are the major activities of every lesson. In planning lessons at least two-thirds of the time should be allocated for these activities.

Brief Short Forms and Phrases

These should be presented directly and

- Drilled rapidly through reading from board and writing in notebook
- Applied in suitable phrases whenever possible
- Practiced with derivatives
- Applied in contextual material

Spelling, Vocabulary, Punctuation, Content Meaning

This correlated phase of learning may be obtained through

- Preplanned practice on spelling words, vocabulary, etc. at specific times during the lesson
- Incidental emphasis as the occasion arises during the lesson

Summaries

Medial and final summaries of the new principles should be

- Given by students at suitable intervals during the lesson
- Kept simple and understandable — example: What new sound have we learned? How is it represented?
- Written on the board
- Elicited after the practice or drill phase

Homework

See details under Homework, pages 49-51.

2380
1865

GUIDES TO LESSON PLANNING

These guides are not intended to represent model or ideal lesson plans. They contain the elements that experienced teachers have found significant in planning a lesson. Each teacher must modify or adapt plans to adjust to his personal strengths and weaknesses and to meet the needs of his students.

SUGGESTED PRESENTATION LESSON

Opening Routines

Reserve a specific section on the chalkboard for your name, the class designation, date, homework, etc.

"Let's clear our desks of everything except our sten notebooks and our closed textbooks. Sit up straight, with feet flat on the floor, right elbow on the desk, left hand at the top fold of the notebook. Relax your grip on the pencil. Date your notebook. Let's see how well we can write these very easy sentences."

Speak slowly and pleasantly. Look directly at the whole class and invite cooperation. Avoid repetition of directions.

Warm-up

Dictate three short, easy sentences, slowly and distinctly. Weight the sentences with outlines which will serve as an apperceptive base. (For this illustration, Lesson 14, Pitman, is used. The apperceptive base uses words with the I diphthong.)

Walk up the aisle between Rows 1 and 2. On the redictation, walk between Rows 5 and 6. Look at students' notebooks; correct individual errors without sacrificing the pacing and timing of the dictation. Note common errors.

"Look at your notes for a second. Raise your hand if you would like to read back."

After the first sentence, call on students at random (not necessarily on volunteers) to transcribe orally one sentence at a time. Record on the board in shorthand as students read. Then say: "Correct

0-68 2381

your errors." Offer encouraging comments after each transcription:

"Good." "Do you agree with that?" "Who would like to help her?"

"How many of us had the sentences all right?" "Good. Let's practice a few of these outlines."

Isolate difficult outlines and provide repetitive practice. Select outlines that illustrate "old" learnings basic to the new lesson, such as "I" words, short forms, phrases.

"Now let's see if we can write these sentences faster and more accurately."

One student may read back all sentences, to save time, or a sampled rereading may be used. "How many did better this time?" "Good."

Apperceptive Base

"Let's look at these sentences again" (pointing to "I" outlines, underscoring or isolating them).

Have the identified outlines read by individual students or by the class.

"What did we use to represent the I sound (or, in other cases, to help us write faster)?" Elicit briefly: diphthong "I," description, position, place, etc.

Motivation

"Today we are going to learn something very similar, which will also help us to write more words (or to write faster). Let's see if you can figure out what it is."

Use one of varied possible approaches: longhand words on board, oral or written mystery sentence, sound, spelling, analogy.

(Sound approach) "Listen to these words: *toy, joy, voice.* "

"What sound is common to all of these words?" "What sound are we going to learn to read and write today?"

Presentation

"I am going to write the outlines for these words on the board. Raise your hand when you can read them." (TOY JOY VOICE)

2383 2382

"Would another girl like to try?" Invite others individually, and then ask the class to read in unison.

"What is the new sound? How do we represent this new sound?"

Elicit entire concept briefly: sound, position, place. Do not hesitate to tell the correct designation if it is not easily elicited.

Spell the outlines in shorthand.

Have the class reread the outlines on the board.

"Raise your hand when you can read these words." (Write outlines.)

ENJOY TOIL NOISE EMPLOY

Have words read by two individuals; then by class.

"Raise your hand when you can read these words."

EMPLOYS EMPLOYED ENJOYS VOICING OIL

Elicit the difference in the formation of the outline OIL.

Drill

"Let's spell and read these words" (pointing to all words on the board). Repeat the exercise several times. "Now let's read these words without spelling." Elicit several individual readings at random.

"Let's see how well and quickly we can write these outlines in our notebooks." Provide for intensive written drill, with occasional reminders about posture and penmanship. Repeat each word three times to pace the writing. Supervise student practice by circulating through different aisles. Offer individual assistance where required.

"Let's skip a line and write these words once more for reading back." (Dictate the words in random order.)

Call on students at random to read back two or three words each. Strive to distribute the recitations so that each student will participate at least once during the course of a period. Offer encouraging comments.

"Let's read again from the chalkboard." Comment on good reading.

Application

"Let's see how well we can write some of these words in sentences."

2383

Dictate three sentences. Have sentences orally transcribed. Record them on the board in shorthand for comparison and correction. Redictate the sentences. Call on students to spell difficult words in longhand. Have correct spellings placed on board and practiced in student notebooks.

Reading the words in the textbook context and words illustrating the new principle are effective Application techniques.

Medial Summary

"What is the new sound we have learned to use today?" "How is it written?"

Elicit the sound, place, position, and other characteristics. Record the identification in symbolic form on a board section reserved for the summary.

Second Presentation and Drill (direct approach)

"Let's look at these sentences again" (referring to Warm-up sentences).

Call on students to read short forms and phrases in sentences.

"What do we call these outlines?" "Why do we use short forms and phrases?"

"Because they help us write faster, we are going to learn a few more simple important short forms today."

Provide a direct, oral presentation in the first set of three outlines. Have class read without spelling. Present the next set of three outlines; drill these and preceding outlines in random order. On completion of presentation and accompanying oral drill, proceed to written drill. Include derivatives and simple phrases.

Redictate short forms in random order for an oral transcription.

Second Application

Dictate application sentences; provide for correction and redictation.

Final Summary

"Would you like to tell us what we have learned to use today?" Elicit the entire concept for diphthongs: sound, position, place, examples. Have another student restate the summary.

2384

Review the new short forms by individual and group reading from chalkboard.

If time permits, have students read from the textbook, air tracing over outlines.

Homework

Direct attention to the new homework assignment. Identify difficulties that may be encountered. Provide for a rapid oral transcription, if desired.

Conclusion

"You were a wonderful class today. I am sure you will appreciate the improved skill your homework will give you."

PLAN FOR GREGG LESSON — LANGUAGE ARTS METHOD

(Lesson 15, Gregg Diamond Jubilee)

Aim

To learn to read and write in contextual matter

A group of new brief forms
Words ending in the syllable *ble*
Words beginning with the prefix *re*

Time Schedule (min.)	*Presentation*	
8	Spell and read the following brief forms and derivatives as they are listed on the board (in shorthand):	Instruct students to read loud and fast as each outline is written. First read the entire group in unison, then in random order, then individually to check mastery.

2384 2385

VALUE ABOUT THING
THINK THINKING BUSINESS BUSINESSES BUSINESSMAN THAN WHY
ONE ONCE WHAT GREAT
GREATER

Add the derivatives indicated.

Dictate for written practice; then have students read from notes.

4 Have letters 116 and 117 of homework orally transcribed.

Distribute reading among individuals as widely as possible, but select students at random.

Practice concert reading of brief forms in this lesson.

½ Record the following outlines on the board (in shorthand), spelling *(p — a — bul)* and reading the first outline listed:

PAYABLE SENSIBLE
TABLES VALUABLE
RELIABLE POSSIBLE
AVAILABLE TERRIBLE
TROUBLE-ED CABLE-D

Ask: "What is the common ending? How do we represent it?"

5 Practice concert spelling and reading of presented outlines. Dictate for written practice. Have individual students read from notes.

5 Dictate letter 116:
1 minute at 40 wam
1 " at 50 wam
½ " at 60 wam
2 " at 30 wam

Have students write with textbook open.

List and practice outlines as requested.

¼ Practice concert reading of brief forms in this lesson.

2386

5 Spell *(re — s — e — v)* and read the first outline of the following listed on the board:	Practice concert spelling and reading.
RECEIVE-D REVISE RECEIPT-ED REFER-RING RESERVE REAPPEAR REPAIR-ED RESIST-ED	Dictate for written practice.
REOPEN REASON REASONABLE	Practice individual reading from notes.
3 Dictate letter 117	
1 minute at 40 wam 1 " at 60 wam 1 " at 50 wam	Have students write with open textbooks.
1¼ *Summary*	Practice concert reading of all outlines presented.
2 *English Pointers*	Have students write longhand in notebooks as word is dictated.
Spelling:	
referring receive *receipt* (meaning?) *asset severely reasonable*	Then list words in longhand on reserved section of board for comparison and correction.
Application	
3 Oral transcription of letters 125 and 126	Provide time for individual reading by students, followed by concert reading a second time if possible.
1 Rereading of theory outlines presented	
1 Rereading of brief forms	
1 Concert reading of all brief forms from chart in Appendix	

2387

PLAN FOR A PITMAN LESSON

(Lesson 11, New Basic Course)

Aims

Specific: To teach the vowels *A* and *AH*
To establish the concepts of first and second place and position

General: To automatize frequently recurring illustrative words and phrases
To develop skill in writing these words and phrases in context
To inculcate proper shorthand work habits
To improve spelling and word comprehension

Preparation

Dictate, transcribe orally, provide for correction from shorthand written on board, the following sentences:

THE BOAT WAS LEFT IN THE LAKE ON MONDAY.

JOE THINKS WE SHOULD CHANGE ITS NAME.

WE SHALL PUT IT TO A VOTE ON SUNDAY.

Provide for drill on the sentences, then redictate and have sentences reread from notes.

Apperceptive Base

Elicit: What four vowels have we learned to use so far?
Tell us which words illustrate the vowel sounds?
Where is the up or down stroke written in these words?
Where are the vowels written?
Where are the outlines written when there is no up or down stroke?
Where are these short forms and phrases written? (Record on board in shorthand and point to them.)

IN-THE A

Teach Directly:

State simply: "We refer to vowels written in the middle of the stroke as being in second place and outlines written on the line as being in second position."

2388

Ask several students to restate the rule, with examples.
State directly: Outlines and phrases written above the line are in first position (point to short forms and phrases).

Ask several students to restate the new rule, with examples.

First Motivation:

"Today we are going to learn a device which will help us write more important words. See if you can tell us what that device is. Listen to these words."

First Presentation

Enunciate the following words slowly and clearly, emphasizing the vowel sound:

at add pass pad lad am catch

"What sound do all these words have in common?"

"What sound do you suppose we are going to learn to write today?"

"Let us repeat the vowel sound together. Again. Now I'll call on you individually to repeat the new vowel sound."

"Watch me as I write the new words in shorthand." (Record the words in parallel columns of longhand and shorthand.)

Elicit the characteristics of the new vowel, using these questions:

How do I indicate the *A* sound?

Where is the light dot written?

In what place is a vowel written at the beginning of the stroke?

Where is the first down-stroke written in these words? Example?

Where is the first up-stroke written? Example?

Where is the outline written when there is no up- or down-stroke? Example?

In what position are all of these words written?

What determines whether a word is written in first or in second position?

UCCS 8888 2389

First Drill and Additional Vocabulary

"Raise your hand when you can read these words." (Place one group at a time on the board, in shorthand).

BLACK BAD GLAD CASH SAMPLE ATTACH
PACKAGE AWAY ACT ACTING ACTED
AWAIT AWAITING AWAITED AMONG AGO
BACK BACKING BACKED TAX (emphasize $x = ks$)
FACT (clarify *kt*)
BLANK (clarify *ing* + *k*) BLANKING BLANKED BANK BANKING BANKED

Give oral and written drill (with posture reminders).

Dictate once for an oral transcription.

Elicit the following spellings: *among ago await awaited.*

Medial Summary

Elicit: What is the new sound we have learned today?
How is it written?
Which stroke determines the position of the word?
Examples?

Write in the Summary Board section:

A = light dot, first place = AT LAD CASH AM (in shorthand)

First Application

Dictate the following sentences; elicit oral transcription; record on board in shorthand; provide for corrective procedures; drill; redictate:

WE SHALL PAY THIS TAX AT THE BANK.
JOE IS GLAD TO HAVE THE PACKAGE BACK.
GIVE THE SAMPLE AWAY.

Correlation

Elicit spellings: *package, sample, tax, tacks.*

Second Motivation, Presentation, Drill Application

Record the following sentences on the board in shorthand and instruct class to raise hands when they can read them:

I WILL GET A CAR ON MAY 18.
JOE LOVES HIS MA AND PA.
I CAN GO FAR IN THE CAR.

Elicit the new vowel sound.

Have the class repeat the new vowel sound in unison and individually.

Ask: "How do we write the new *AH* vowel sound?"

Provide for oral and written drill on the new words.

ma pa far car

Dictate the sentences, providing for correction and redictation.

Medial Summary

Elicit the characteristics of the new vowel and add to the Summary section.

AH = heavy dot, first place = MA PA FAR CAR (in shorthand)

Third Motivation, Presentation, Drill, and Application:

Instruct class to raise hands when they can read the following phrases recorded on the board in shorthand:

I-AM AT-THE CATCH-THE WE-BELIEVE TO-TAKE TWO-MONTHS IN-SUCH WITH-SUCH

Provide oral and written drill.

Final Application

Dictate the following letter, providing for oral transcription, remedial activity, drill, and redictation:

OCES
2391

Joe: I am glad that you can get a car when you are 18. You will be able to go far away. Has your pa given you the cash for it? Do you have to pay him back? Yours

Final Summary

Ask the following questions to elicit summary statements.

What are the sounds we have learned to write today?

How do we indicate the sound of *A*? Of *AH*?

In what position do we write the outlines for words which have the first vowel sound of *A*? Of *AH*?

How is the first-position word written?

What must be above the line in a first-position word?

Where are second-place vowels written?

How is a second-position word written?

What determines whether an outline is written in first or second position?

Write this mastery challenge word, but think before you write it. (Dictate the word *example*.)

(Correct, clarify, and practice the outline.)

Homework Preview

Students read outlines assigned from text, with longhand covered, then uncovered.

Students read selected sentences assigned from text, first silently, then orally (individually).

2392

INTERPRET-ED INTERVIEW-ED
INTERNATIONAL INTERFERED-D

Write the following outlines below the column headings:

INTR

INTRODUCE-S-TION
INTRICATE

ENTER

ENTER-ED-PRISE
ENTERTAIN-ED

ENTR

ENTRANCE-S

"What differences do you notice in the beginnings of the words *introduce, intricate, enterprise, enter, entrance?*"

(Enunciate slowly and clearly to stress differences.)

Spell and read as in preceding drills. Dictate for written practice. Spell and read entire group of words, in unison and individually.

First Application

Dictate:

What is the rate of interest at your bank?

Have pupils read from notes.

He entered the room but did not interrupt the meeting.

Place on board in shorthand for correction and remedial practice.

We shall not introduce an intricate proceeding.

Among other things I am interested in these two enterprises.

Redictate and have several or all sentences reread.

Check spelling of *proceeding, enterprise, interrupt, intricate* (meaning).

Medial Summary

"What is the new word-beginning?"

"How was it represented?"

Second Preparation

"What is the ending in the words *meeting, proceeding?*"

Write the outlines in a vertical column and read the words

HOLDING, EVENING, FEELING, THING, OPENING

Second Motivation

"How would you write the plural of these listed words?" (Invite suggestions from pupils.)

Second Presentation

Record the plural of each outline in parallel columns, as indicated:

MEETING	MEETINGS
PROCEEDING	PROCEEDINGS
HOLDING	HOLDINGS
EVENING	EVENINGS
FEELING	FEELINGS
THING	THINGS
OPENING	OPENINGS

"How was the plural written in each case?"

Spell and read, in unison and individually.

Dictate for written practice. Read from notes and from board.

Second Application

Dictate:

Do you want to hold our meetings on Tuesday evenings?

Several openings are reported in these clippings.

In the interview, he mentioned his feelings about these things.

Proceed as in the previous application.

Have all outlines on board read.

"What device have we learned to use in these words?"

Medial Summary

Third Motivation

2395

Write in longhand on the board:

Please send one them today.

"Can you supply the missing word in the sentence?"
"So you see, it is possible to read phrases that omit unimportant words."
"Why would we want to omit words?"

Third Presentation

List and read (pupil or teacher) the following, in shorthand:

ONE-OF-THEM IN-THE-WORLD
MEN-AND-WOMEN MANY-OF-
THE TWO-OR-THREE DURING-
THE-PAST WILL-YOU-PLEASE
GLAD-TO-SAY IN-A-FEW-DAYS

"What have we done in these outlines?"

Spell and read. Dictate for written practice.

Third Application

Dictate:

Will you please send one of them today?

Proceed as with previous applications.

Many of the books are up-to-date.

Spelling: *up-to-date*

Medial Summary

"What have we learned to do in these phrases?"

Final Summary

"What are the ways we have learned to write more quickly in today's lesson?"

Final Application

Have the board outlines read.

Orally transcribe letter 313 from the textbook.

2396

QUESTIONING

While a skill subject generally excludes much discussion and verbalization, good questioning stimulates thinking, involves pupil participation, and creates interest. It is therefore an essential part of good teaching. Key questions should be a part of the lesson plan. Questions should:

Generally start with *how, why, where,* or *what*
Be carefully planned, especially if they are pivotal in nature
Be simple, single, and pertinent
Be thought-provoking and factual
Be answered in complete sentences if they are thought-provoking; in one or two words, if factual

Be stated first, then answered by the student called upon
Be distributed throughout the class
Not be repeated by the teacher
Allow for individual differences among students
Involve nearly every member of the class, with volunteers being called on judiciously

Be answered in concert only on the rare occasions when a drilled response is acceptable

TEACHER ACTIVITY

In a typical developmental lesson the following activities are desirable:

- During the presentation the teacher at the board and in front of the room

  Makes eye contact with every member of the class
  Speaks audibly to the students in the last seats
  Writes so that pupils may observe the writing construction

- During the drill the teacher circulates about the room and

  Observes the writing of students
  Makes corrections in notebooks as needed
  Observes common errors requiring immediate reteaching
  Determines if the pacing of the drill is proper for the class
  Determines if sufficient drill is being given

  Makes suggestions to individual students regarding posture, penmanship, etc.

- During the dictation the teacher stands in a place visible and audible to all but not too close to anyone. This place should be changed from time to time.

2297

- During the reading back of homework the teacher

  Circulates about the room observing the quality of the homework

  Lists on the blackboard outlines on which errors have been made, for subsequent remedial work

  Uses the blackboard for spelling of English words, transcription items, etc.

USE OF THE CHALKBOARD

The chalkboard is the most effective visual aid available to the teacher. Use it:

To maintain student interest
To provide a model for student imitation
To enable students to see *how* outlines are written
To demonstrate the fluency with which outlines should be written
To show the logical development of the lesson

To supplement the material in the textbook by listing word families and derivatives, comparing outlines easily confused, and arranging the material in different combinations.

The chalkboard may be used to demonstrate correct penmanship by:

Enlarging difficult outlines
Illustrating contrast in sizes of strokes

It provides a place for:

Aim of the lesson
Transcription items — spelling, word meanings, capitalization, etc.
Summaries
Homework
Directions to students

It provides a means for oral review.

It demonstrates to pupils how to make corrections.

In using the chalkboard, consideration should be given to:

- Maximum visibility

  Assign seats according to height but make allowance for poor eyesight.

  Write high enough on the board to enable students in the rear to see easily.

2398

CHALKBOARD ILLUSTRATION OF THE DEVELOP
(with teaching suggestions)

Summary	Warm-Up	Apperceptive Base	First Presentation	First Drill
Class/Teacher/Date Medial Summary 1 Medial Summary 2	Dictate 3 to 5 short sentences or a letter. (Sentences should contain words to be used to relate "old" learnings to "new" learnings. Read back. Write on board for comparison. Correct and practice outlines. Drill selected outlines. Redictate. Reread (optional). **Note:** Where there is no "old" learning, review short forms.	Correlate with preceding column. Motivation	Select the most suitable method: Analogy (word method) Sentence method Sound method Direct method Elicit concept.	Write and identify outlines in families. Write and let students identify. Spell outlines phonetically and identify. Write and let students spell phonetically and identify. Pace by dictating each word repetitively. Dictate each word individually. Students read back from notebook and/or from board. Complete coverage. Elicit medial summary and place on first board.

2399

MENT OF A LESSON IN STENOGRAPHY 1-2

Second and Third Presentations and Drill	Application	Short Forms and Phrases	English	Miscellaneous
Similar organization to first Presentation and Drill, but vary approaches Elicit medial summary and place on first board.	Sentences or letter (see Warm-up). Final summary (elicited but not necessarily recorded)	Write outlines on board rapidly and read them. Apply in phrases at once. Drill rapidly. Apply in sentence or short letter form. Summarize by reading rapidly from board and then rewrite on Summary board.	Spelling Hyphenation Apostrophes Definitions Business terms	Homework Test announcement (in advance)

CHALKBOARD ILLUSTRATION OF THE DEVELOP

(with teaching suggestions and shorthand)

Lesson 8, New Basic Course

Summary	Warm-Up	Apperceptive Base	First Presentation	First Drill
Class/Teacher/Date Strokes in one syllable words are halved Light T (outlines **late, plate)** Dark D (outlines **bed, dead)**	Dictate sentences below. Read back. Write on board. Pupils correct and practice outlines. Drill selected outlines. Redictate. (In shorthand) **We can deliver the play clothes.** **The manufacturer believes that $14 is way below the fair sum.** **We think that the railroad ought to make all deliveries with no delay.** **Put his name on the envelope and lay it in the safe.**	Correlate with preceding column by dictating the following outlines and writing on the board: (In longhand and shorthand) *play* **play** *may* **may** *way/ weigh* **way** *no/know* **no** *lay* **lay** Elicit: One syllable words Light strokes Motivate by announcing: We are going to learn a shortcut to increase speed.	Use analogy. Write the longhand of the words below next to the related word of preceding column. Elicit the addition of "T". Then, write the shorthand outlines. (In longhand and shorthand) *plate* **plate** *mate* **mate** *wait/ weight* **wait** *note* **note** *late* **late** Elicit concept. Confirm: One syllable words Light stroke Followed by T	"Write, spell, and tell" outlines and families. Or, write, and let students "spell and tell." Spell outlines phonetically once or twice during drill. Emphasize proporations. (In shorthand) **play-plate may-mate way-wait know-note plate-plates wait-waits waiting wet met net note-notes late-let-lets coat-coats cut-cuts** EMPHASIZE: **kept left** Pace drill by repeating word and increasing speed. Complete coverage. Redictate. Read back from notes. Read from board. Elicit medial summary and place on first board.

MENT OF A LESSON IN STENOGRAPHY 1-2

Second and Third Presentations and Drill	Application	Short Forms and Phrases	English	Miscellaneous
Motivation: Can you read these mystery sentences? *I paid several dollars for the bed.* *I saved to pay this debt.* *bed* **bed** *saved* **saved** Elicit concept Drill: *bed beds saved dead* Emphasize: *loved* Elicit summary and place on first board Third Presentation Direct Method: Read these words: *paid played weighed laid led date debt* Elicit reason for non-halving. Drill all board outlines.	Dictate sentence observing procedure in Warm-up: *The manufacturers can deliver the beds and the plates in May.* *The sale of the goods may be kept for several days.* *We are waiting for the note that you left.* *They paid the debt in 30 days net.* *Can you wait on me and have this weighed?* Provide posture and penmanship reminders at the beginning and middle of the period and when needed.	Write outlines on board rapidly and read them. Apply outlines in phrases at once. Drill, pacing rapidly. Apply in sentence form. (See Warm-up.) **able-to you-will-be able-to to-be-able-to we-are-able-to called could could-be could-have-the cold gold told owe too-late to-let two-hours you-will-note-that met-the let-us to-deliver-the** *You will note that the manufacturers delivered the beds and the plates too late.* *You will be able to sell the goods that you kept in two hours.* *I paid the debt that I owe in gold.* *Your people told me that you had called them.* Final summary	English and spelling: *weight/wait* *equaled* *oh/owe* *too (late)* *two (hours)* *net = full amount/* *30 days net*	Homework

Keep boards clean — wash daily; clean erasers daily; erase properly.
Rule lines to simulate a shorthand notebook, Pitman or Gregg (permanent scratch lines are desirable).

Write shorthand standing sidewards; switch from one side to the other; avoid turning back to the class.

Use pointer and stand away from the board when outlines are read back.
Test visibility by sitting in the last seat.

- Teacher demonstration of a high degree of writing skill, indicated by

  Accuracy of outlines
  Perfection of size, shape, shading, and proportion
  Fluency of execution

  Writing an enlarged outline in slow motion, followed by normal writing of the outline

- Proper arrangement

  Logical, sequential order of material presented going from left to right
  Separate board sections reserved for homework, spelling, summaries, transcription items

  Colored chalk to highlight important outlines

As a general rule, students should not write shorthand on the board. However, the teacher may:

Assign a student to place homework on board in longhand.
Assign a student to write spelling words in longhand.
Assign a student to write longhand of test words when reviewing a test.
For variety (rare instances), send a good student to board for self-test.
As a treat on days of low attendance, send all students to board.

Air writing may be used by the teacher and students for difficult outlines either before or after outlines have been written on board.

The foregoing examples indicate what a chalkboard might look like as the lesson is developed. Teaching suggestions are included with the chalkboard material.

PRACTICE FOR DRILL AND APPLICATION

The word *drill* has come to mean repetition without variation. To escape this connotation, the word *practice* seems preferable. As used here, it means purposeful, varied and motivated repetition. This kind of practice generates active, attentive interest and insures learning.

Since the development of stenographic skill requires constant repetitive practice, it is important that this be done properly. Various suggestions are offered to make such drill effective. The teacher must be on the alert to sense which types of practice best suit her class and be ready to vary the practice when she recognizes any decrease of attention or interest. Several *different types* of practice should be included in each lesson.

Short/Brief Forms and Phrases

Motivate the learning. Demonstrate how much time is saved by short-cutting. Indicate that short forms constitute the major portion of the vocabulary of the average business letter.

Dictate short forms repetitively and briskly several times each when first presented.

Have students read from the board in sequence and at random.

Present the short forms with their phrases wherever possible.

Present the derivatives of the short forms.

Compare them with similar, known forms and practice together.

Time the dictation of the short forms; then increase their speed.

Apply them in short sentences or a short letter.

Dictate them in short sentences or in a short letter at higher rates of speed.

New Vocabulary

Motivate the practice for fluency or penmanship or speed.

Be specific about the goal of the practice.

Have students spell phonetically and read the outlines on the board, set a speed goal.

Have students read outlines from the board at random; set successively higher speed goals.

Have individual students or rows compete for speed in reading and spelling.

Dictate and spell outlines as pupils write in notebooks.

Dictate each outline several times to set the pace.

Dictate the outlines consecutively and then at random.

Redictate the outlines at a faster pace.

Have students read back the outlines practiced.

Have the class trace or rewrite outlines during the reading back.

Practice word families; e.g., *serve, reserve, deserve,* etc.

Apply words practiced in short sentences or in a letter.

Have students spell and read outlines from text on a timed basis.

Intersperse dictation of outlines with phrases or short sentences that include the outline.

Connected Matter Using Shorthand Plates

Read material from text; set a speed goal.

Have individual students or rows of students compete for highest speed.

Have students trace over shorthand plate during reading, with eraser end of pencil or back of pen; or write over transparent paper placed on page.

Dictate the material at announced rate of speed with textbook open.

Have students read back from notes, tracing with pen or pencil or eraser end

Redictate with textbook open increasing speed and having students trace outlines

When reading homework notes in class, have students trace over notes or have them leave blank lines under each line of homework notes to fill in during the reading back.

Allow a few seconds for silent reading of advanced sentence before calling on a student to read.

New Connected Matter

Preview difficult outlines before dictating or dictate material first; then postview difficult outlines.

PH2405

Have material read back as students trace over the notes or rewrite. Drill outlines on board and redictate at higher speed.

Some of the speed-building techniques listed on pages 70-72 may be used on occasion. However, for practice at this level the teacher should use shorter speed spurts, words of high frequency, copious previews, and very short letters.

It is neither necessary nor desirable to have all the dictated material read back. The teacher should select judiciously the parts to be read back.

The teacher's attitude and manner during repetitive practice is very important. Enthusiasm, cheerfulness, and encouragement are contagious. Pupils should leave the classroom with a feeling of achievement and accomplishment.

REVIEW

Review differs from repetitive practice in that it attempts to *combine* previous learnings in a different manner and to develop a more extensive automatized shorthand vocabulary. It is, in addition, a *re-view*, a different look, at what has been taught. Consequently, it should offer:

An approach different from that used during the original presentation and practice

A more inclusive vocabulary highlighting the relationships of principles and applications previously studied

A greater variety of the different drill techniques listed above

A greater opportunity for all students in the class to contribute to the lesson

An opportunity to provide a cumulative or spiral approach

At suitable intervals, written work to test the students' understanding of the principles learned and their application

Where no unusual difficulty is identified, the paramount goal of a review day may be the development of skill in reading connected matter and taking and transcribing dictated contextual material.

The lesson should move quickly from one phase to another.

Theory should be reviewed quickly, in the manner of a medial summary.

Activities during a review lesson might include the following:

- Dictation of a homework letter
- Reading back and remedial practice

TM2406

- Redictation 10 words faster
- Review of short/brief forms of the lesson by reading rapidly from the blackboard as the teacher points to the outlines in random order and by calling on individuals occasionally
- Reading a letter from the homework assignment
- Rapid review of the brief/short forms on the board
- Review of one section of the theory through dictation of outlines (The outlines are then placed on the board and the rules reviewed.)

Timed dictation of a letter previously dictated, with the textbook open:

Dictation at 40 wam for one minute

Reading by students from notes

Remedial work: comparison of student outlines with those in the textbook

Redictation of material at 50 wam

Remedial work: comparison of student outlines with those in the textbook and practice of any that caused difficulty

Redictation at 60 wam

Remedial work: as before

Dictation at 50 wam with books closed

Reading back from notes

Spelling and transcription elements selected for review

Rapid review of the theory and brief/short forms which are on the blackboard

Review of the remainder of the theory involved in the lesson

Additional dictation from the same letter, observing the same procedure until the students can take sustained dictation for 2 minutes, and then for 3 minutes

EARLY DICTATION, READING, AND TRANSCRIPTION

In Stenography 1, connected matter should be dictated almost at the start. The major advantages of using connected matter rather than isolated words are that previous learnings are reinforced thereby automatizing a larger vocabulary, and that the study of shorthand is placed in a

realistic setting. Dictation practice should include dictation with the book open first and then closed, of previously drilled shorthand plate material. This same familiar vocabulary may then be dictated in slightly different contexts. Short sentences may be used to review known principles and to introduce new ones. Application of new and old learnings may be made through the use of short sentences and simple letters.

Some of the elements to consider in the early stages of dictation and transcription are:

Teacher's Role

Voice: clear, low-pitched, well-modulated and audible

Inflection: indicative to some extent of the placement of commas and periods

Dictation: smooth and not affected by speed markings; avoiding metronomic dictation

Phrasing: following the thought sequence primarily but with attention to shorthand phrasing wherever possible

Position: standing in clear view of the entire class and away from any pupil

Rate of Dictation

Untimed at the beginning but rapid enough to establish a pattern of fluent writing (In the language arts method, a minimum dictation rate may be set.)

Governed by the level of students' skill but measured and increased gradually during the term

Adapted to the difficulty of the dictated matter, the length of the "take," the context, and whether new or review

Based on the number of syllables a minute. Material is to be marked off in appropriate intervals

Announced to the students as a motivational stimulus

Accuracy of Notes

Stressed from the beginning to enable students to transcribe easily and accurately (traditional method)

CMS 2408

Developed through extensive, repetitive, fluent practice on shorthand plates (language arts method)

Compared with those in the textbook or on the blackboard

Previewing Material

Develops fluency by eliminating mental and emotional blocks

Limited on occasion in order to encourage initiation of outlines

Governed by the purpose of the dictation; e.g., speed development, application, testing, etc.

Written Transcription

Affords an opportunity for pre-transcription training and remedial work in spelling, sentence structure, letter forms, punctuation, meaning of business terms, etc.

May include:

- Practice in class and at home from shorthand plates and later from students' notes
- Correction of such transcripts in class orally or from the blackboard

Must be emphasized from the beginning and properly weighted in the testing program

Reading Shorthand Plates

Reading shorthand plates serves several important purposes. Some of these are:

Developing the facility to read shorthand rapidly and fluently

Building the students' shorthand and longhand vocabulary

Enabling students to write shorthand through visual familiarity

Helping students to develop a superior shorthand penmanship

Aiding students to understand the thought content easily

Providing practice in correct speech habits and extending the students' speaking vocabulary

2409

Various techniques may be used in reading shorthand plates

- Reading of shorthand plates in class (silently or orally):
  - Reading to be rapid and timed for effective motivation
  - Immediate assistance to be offered to faltering pupils
  - Difficult outlines to be previewed
  - Procedure for deciphering difficult outlines to be taught
  - Questions as to thought content and English usage to be postponed to the end of sentence or paragraph
- Shorthand plates assigned for homework
  - Reading to be an integral part of the daily homework assignment
  - Material to be within students' understanding
  - Material to have been previously prepared or previewed in class
  - Printed transcripts to be made available for weak students
  - Completeness of preparation to be checked in class the following day
- Outside reading of shorthand books and magazines; e.g., *Junior Secretary, Pitman Journal, Today's Secretary*

Since shorthand is phonetic writing, it is ideally suited to motivate and to supplement the reading improvement program in the city schools. The "dictionary habit" for pronunciation, definition, and spelling can be initiated and habituated. The teacher's reading should, of course, be a model for students to imitate. Students should be trained to read audibly with correct pronunciation. Students with poor speech patterns should be corrected tactfully. Students with foreign accents should be encouraged to listen critically to the teacher and to other pupils for correct pronunciation and enunciation.

ENGLISH AND THOUGHT CONTENT (Correlation)

The use of correct English is essential for an accurate transcription of the material dictated. The teacher must strive to develop proficiency in written English through the following procedures:

- Widening the students' general English vocabulary and specialized business vocabulary by encouraging

241n

Reading good books and newspapers

Listening to worthwhile radio and television programs

Keeping a spelling and vocabulary notebook of individual difficulties

Assigning practice on lists of commonly misspelled words (See pp. 108-109 for sample lists.)

Teaching students the correct use of all parts of the dictionary and requiring them to consult the dictionary to determine spelling, pronunciation, syllabication and meaning of words

Requiring students to indicate punctuation, capitalization, and paragraphing when reading notes back

Dictating in such a manner that to some extent the commas and periods will be obvious

Training students to insert punctuation and paragraphing during silent reading and to check the spelling of unfamiliar words with the dictionary

Emphasizing correct spelling, hyphenation, pronunciation, capitalization, and paragraphing

Discussing daily at least one rule of the mechanics of written English and including numerous illustrations within the students' range of experience

Checking the students' understanding of the content of the material dictated

Calling students' attention to various business situations and business procedures as they occur in the correspondence, and to a particularly well-structured and well-composed letter

Note: However desirable these learnings are, judgment must be exercised about the amount of time to be allocated to these activities so that students will not sacrifice skill-development practice.

In order to communicate effectively with superiors, co-workers, and callers at the office, employees must also be able to speak English correctly and to enunciate clearly. The teacher's English should be cultured and his speech clearly and correctly enunciated. The students should at all times be encouraged to speak clearly and audibly, to pronounce and enunciate words correctly, and to speak intelligibly and without awkward pauses.

HOMEWORK

The importance of homework practice in a skill subject should be made abundantly clear to the class at the very beginning of the term. Analogies to known skills, such as piano playing and swimming, will help clarify this concept.

The following suggestions will prove helpful:

Supervise the first homework assignment. A step-by-step procedure under teacher supervision will make it clear how homework is to be prepared. Detailed instructions on the homework sheets (if these are used) will aid pupils to remember.

Motivate the assignment by devoting ample preview time to it, by permitting students to begin the assignment in class, and by holding the class responsible for:

- Reading plate material assigned
  Stress fluency and rapidity of reading.
  Ask questions on spelling, punctuation, word meanings.
  Time the reading to encourage rapidity.
  Have the class trace during the reading-back phase.
- Reading words, sentences, or letters copied in shorthand
  Follow instructions under the previous topic.
  Use blank lines or columns so that the class can write during reading
- Taking the material from dictation
  With or without preview of difficult words
  At increasing rates of speed
- Reading back material dictated above. The pupil should be trained to trace or rewrite during this activity.
- Identifying homework material used as the apperceptive base for new lesson
- Applying the homework as a test or self-test on either the vocabulary or contextual material

Give the assignment in writing at a predetermined time.

Beginning of period
End of period
Logical moment during period

Check the homework for completeness and correctness.

- Collect daily and record.
- Require absentee homework to be made up upon return.
- Return incomplete homework immediately to be completed.
- Spot-check regularly for proper preparation.
- Speak to delinquent homework-doers promptly.
- Inspect all papers on a regular schedule and return with appropriate comments.
- To simplify checking:

  Give each assignment a consecutive number.

  Assign each student a number according to some predetermined plan.

- To simplify returning. Have each student use assigned number, such as "42" to designate 4th row, 2nd seat.

Display well-prepared homework, and offer suitable class and individual commendations.

Simplify the homework.

Preview connected material.

Read shorthand plates in class before assigning them.

Teach and drill the new vocabulary thoroughly.

Provide for individual differences.

Give an average assignment of 40 minutes.

For more successful students provide something challenging—additional letters, word initiations, shorthand records based on homework.

For less successful students provide review material, short/brief forms and vocabulary, and shorthand records based on homework.

Provide variety of content in the assignment.

Introduce new and review vocabulary.

Present connected matter, both new and for review.

Present short/brief forms and phrases, both new and for review.

Provide for reading of shorthand material.

Provide for transcribing shorthand plates into longhand.

Provide for transcribing longhand into shorthand.

Provide practice of spelling words, comma rules, cities, states, and business terms.

Afford practice from dictation records or tapes.

STUDY GUIDE FOR STUDENTS

Set the stage for effective home study.

Time: Set aside an adequate amount of time. Draw up a schedule and adhere to it.

Place: Set aside a regular area or room free from distractions (TV, radio noise, interruptions, family conversation, and intrusions, etc.) Clear desk, table, and wall of those objects which might divert your attention.

Tools: Have essential tools (pen and/or pencil, notebook, rulers, dictionary, books, etc.) readily available.

Furniture: Provide comfort but not too much comfort as to induce drowsiness or inattentiveness.

Effort: Devote yourself wholeheartedly to the task at hand. The desire to learn and intensive, concentrated work are the keys to effective learning.

Develop the proper set of attitudes.

Aim to obtain as much benefit as possible from your study session.

Determination is important for effective, permanent learning from study.

MEASURING PROGRESS

TESTING PROGRAMS

The value of a shorthand test may be determined by the extent to which it motivates study, measures progress, reveals weaknesses for remedial teaching, provides specific evidence of achievement, and indicates that the class is ready for further learning. In addition, uniform tests establish standards for marking and provide a means of coordinating the work of one grade with that of the next.

It is essential, therefore, that in constructing a good measuring instrument the two basic factors of validity and reliability be considered. The validity of a test is the extent to which the test measures what it is supposed to measure. Does the test cover all the items, or is the sampling distributed so that the important material is covered? The reliability of a test is measured by the consistency with which it achieves approximately the same results each time it is used. Tests may include:

Short Daily Tests

Stimulate pupils to study
Check effectiveness of home study
Measure grasp of new learning

Specific Purpose Tests

Brief/short forms and phrases, with a high degree of mastery required

Word recognition in timed transcription of isolated outlines from the text, chalkboard, or homework

Transcription and reading of connected matter; first, from assigned, thoroughly drilled plates; later, from familiar material, such as homework, etc.

Dictation and transcription of

- Definitely assigned material (with textbooks open or closed)

- Selections from an assigned larger unit (with textbooks open or closed)
- New-matter dictation using familiar vocabulary

Spelling

Comprehensive Tests

Shorthand vocabulary, measuring the power to retain material taught over a period of time and covering a number of units of work

Dictation and transcription, measuring the power to write and transcribe material taken for a *maximum* of three minutes of uninterrupted dictation or two, two-minute "takes"

Departmental Uniform Tests

Provide uniform standards of evaluation for every class in the grade

Given at the end of a unit of work, at the midterm and/or at the end of the term

Tests for Awards

Measure knowledge of theory and/or dictation and transcription skill

Motivate pupils to greater effort in order to qualify for pins or certificates.

Sponsored by publishers of shorthand systems

SUGGESTIONS FOR CONSTRUCTING AND ADMINISTERING TESTS

Theory

Select common, useful, high-frequency words, all of which have been thoroughly drilled in class and practiced for homework.

Select words illustrating normal principles of outline construction covered within the unit.

Start with a few of the easier outlines to instill confidence.

Interpose relatively easy words with more difficult words.

Dictate the words at a prescribed rate.

Avoid repetition of words in the theory and in other parts of a longer test.

Test mastery of theory only after an opportunity for automatization has been provided.

Maintain a suitable proportion between the number of theory words and the number of brief/short forms and phrases and establish an appropriate relative value for each group.

Dictation and Transcription

Weigh this phase of the testing program more heavily as the year progresses.

Make provision for increasing the rate of dictation, the rate of transcription, and the length of the "take" during the course of the year. (See Suggested Goals for Tests, pp. 59-60.)

Encourage the use of a dictionary.

Mark major errors in accordance with the Regents schedule.

General

Maintain a proper balance between the time allocated to teaching and to testing.

Construct tests so that they are easy to administer and to correct.

Assign values to the various phases of the testing program in relation to their importance in the skill-building program.

At the beginning of the term, prepare tests simple enough to encourage and motivate students.

Establish definite routines for the heading and arrangement of test papers, and for their distribution and collection.

Make a careful diagnosis of individual and class errors while marking papers, and plan proper remedial work.

Return test papers as quickly as possible, and engage in remedial work while the content of the test is fresh and interest is high.

Establish a routine for reviewing papers that will save time and yet provide effective remedial practice.

Recognize outstanding test papers, especially those showing great improvement, by calling them to the attention of the class and posting them on the bulletin board.

Avoid penalties so severe as to discourage the class.

Penalize more heavily on short/brief forms, phrases, and spelling words than on theory words.

Penalize errors on theory tests covering a limited vocabulary proportionately higher than those on tests covering an extensive vocabulary.

Keep the mailability standard before students at all times, stressing the need of working towards 100% accuracy as the business standard.

SUGGESTED END-TERM GOALS

These tests are designed for a 40-minute period. They may be expanded in those schools where more than this time is allowed for testing.

FORM I
(For classes taught by the Traditional Method)

	FIRST TERM		SECOND TERM	
	Words a Minute	Number of Words	Words a Minute	Number of Words
PART A Dictation and transcription of a list of short/brief forms, phrases, and words illustrating principles	6 - 8	35 - 50	8 - 10	35 - 50
PART B Dictation and transcription of connected matter, using familiar vocabulary of 1.3 to 1.4 syllabic intensity	25 - 30	75 - 90	45 - 50	135 - 150 (Two Letters)
	VALUE AND DEDUCTIONS			
1. Value of Part A a. Deductions per word to be equated according to the number of words dictated b. Shorthand and longhand to receive 1/2 value each	50%		1. Value of Part A 35% (Same as a and b, First Term)	
2. Value of Part B a. Major error (as defined in the Regents marking schedule) — 2% b. Minor error (as defined in the Regents marking schedule) — 1/2%	50%		2. Value of Part B 65% (Same as a and b, First Term)	

FORM II
(For classes taught by the Language Arts Method)

	FIRST TERM		SECOND TERM	
	Words a Minute	Number of Words	Words a Minute	Number of Words
PART A				
Dictation and transcription of short forms, brief forms, and phrases	10	35 - 50		
PART B				
Transcription from shorthand plates		60 - 100		
PART C				
Transcription from open or closed book dictation of familiar connected matter, 1.3-1.4 syllabic intensity	40 - 60	80 - 120		
Dictation and transcription of connected matter, using familiar vocabulary of 1.3-1.4 syllabic intensity			45 - 50	(Three letters) 180 - 225

First Term

1. Value of Part A — 40%
   a. Deductions per word to be equated according to the number of words dictated
   b. Shorthand longhand to receive 1/2 value each
2. Value of Part B — 20%
   a. Major error (as defined in the Regents marking schedule), 2%
   b. Minor error (as defined in the Regents marking schedule), 1/2%
   c. Transcription to be timed at the rate of 20 w/m
   d. Incomplete transcripts to receive partial credit
3. Value of Part C — 40%
   (Deductions for major and minor errors same as in Part B)

Second Term

Value — 100%
a. Major error (as defined in the Regents marking schedule), 3%
b. Minor error (as defined in the Regents marking schedule), 1/2%

Second-Year Shorthand and Transcription

OBJECTIVES

Fundamentally, the second year focuses on the production of mailable transcripts. Specifically, these goals are established:

To improve shorthand skills through:

- Systematic review of shorthand theory
- Application of shorthand theory to an extended vocabulary
- Taking dictation at increasingly higher rates of speed for sustained periods of time
- Practice leading to greater fluency in reading shorthand notes.

To develop the ability to take easily and to transcribe accurately letter material dictated at 80 wam.

To develop transcription skills through:

- Emphasis on greater speed in typewriting and a higher degree of accuracy
- Stress on the use of the dictionary and manuals for identifying the elements of correct written English: spelling, word usage, punctuation, paragraphing, syllabication, business vocabulary
- Correct use of the shorthand notebook and writing tools
- Good shorthand penmanship and techniques in reading notes written under pressure
- Preparation of carbon copies and envelopes
- Techniques for making careful corrections including erasing, crowding, and spreading
- Proper use and care of equipment

To train students to evaluate their performance, to analyze their own work for specific weaknesses, and to apply remedial measures

To give students an understanding of business procedures and practices through analysis of the contents of letters

To develop the students' ability to arrange and type tabulations consistent with the standards of the New York State Regents Examination

To develop the ability to prepare neat, attractive, and correctly styled transcripts

To develop in the students desirable work habits, attitudes, ideals, and appreciations essential to the successful performance of the duties as a stenographer and of the broader occupational role

2421 2420

CLASSROOM ACTIVITIES

Effective teaching in the second year of shorthand depends upon the appropriate allocation of time to the different elements of the lesson as well as upon a variety of approaches to maintain the interest and enthusiasm of the pupils. A vigorous tempo will stimulate greater effort on the part of the students toward established goals. A realization of success as revealed by frequent formal and self tests will develop the confidence necessary for continued drive toward accuracy and endurance in reading and writing shorthand.

The activities listed below are suggested procedures and are intended to serve as aids in preparing the daily lesson. Methods for carrying out these suggestions are treated in greater detail in the following pages. In the dictation class the major portion of time should be devoted to skill-building dictation.

STARTING EACH LESSON PROMPTLY

Establishing a definite activity to start students working as soon as they enter the room

Organizing materials and taking care of clerical duties so that the work of the period can begin when the bell rings

READING SHORTHAND PLATES

Reading familiar material for fluency, accuracy, and rapidity

Reading scattered selections throughout text to develop skill in deciphering unfamiliar outlines

Having the class trace during the reading

Timing the reading

REVIEWING HOMEWORK

Reading assigned plate material in preparation for writing while class traces

2422

Reading students' notes while class traces or writes

Dictating homework letters

As application of theory words reviewed

As means of building skill according to some definite plan

DAILY TEST (Optional - Short)

Word test

Spelling test

Dictation and/or transcription test

Homework letters

Previously practiced material

New material with familiar vocabulary

New material requiring the initiation of outlines

BRIEF/SHORT FORM AND PHRASE DRILLS

Isolated brief/short forms, and phrases

(See Shorthand Theory, p. 41.)

Brief/short form sentences, paragraphs and letters

Previewing brief/short forms before dictation

Dictating connected material followed by postview and practice on brief/short forms and redictation at increased rate of speed

THEORY WORDS

Previewing and practicing an expanded vocabulary of shorthand outlines, their derivatives and families in preparation for assigned homework

Previewing and practicing an expanded vocabulary of shorthand outlines, their derivatives and families before dictation of connected matter containing them

REVIEW LETTERS

Dictation of one or several letters according to some specific plan for building speed

Redictation of practiced letters at slower speed for control

Redictation of practiced letters with slight revisions to maintain students' attention

NEW LETTERS

Dictation of new letters with familiar vocabulary for speed building

Dictation of new letters with new vocabulary

Dictation for three to five minutes at slower speeds to build sustained writing power

Dictation at uneven rates of speed to develop memory (starting fast and slowing up)

Dictation in spurts to overcome speed plateaus

SPELLING, VOCABULARY, PUNCTUATION

Preplanned questions asked at suitable times during period

Questions interspersed throughout lesson arising from the context

Systematic presentation of punctuation rules followed by application in letters dictated

Developing a vocabulary common to a particular business

Use of dictionary and stenographers' reference manual

ESSENTIALS OF INSTRUCTION

CLASSROOM ORGANIZATION

In order to use every minute of the period profitably as well as to provide a businesslike atmosphere, it is imperative that the teacher establish efficient classroom routines. Some recommended procedures are:

Appointing monitors to prepare chalk boards for the work of the period and to erase them at the end

Organizing activities to get students seated and to work immediately:

- Practicing short/brief forms or outlines to be reviewed
- Transcribing in longhand from shorthand written at home
- Having a student leader dictate homework letters
- Having a student read the letters transcribed the previous day for individual checking
- Taking dictation from tape or record player

Setting up definite routines for checking attendance, collecting homework, distributing papers, and housekeeping activities

CORRECT WRITING AND WORK HABITS

Continued training of students in correct writing and work habits is essential. This should include:

Organization of desks, i.e., only needed materials to be on pupils' desks

Use of correct tools, such as correctly lined and ruled notebooks with paper of good quality and well-sharpened pencils or smooth-writing pens

Proper use of tools, for instance, lightly held forward moving pen (with top removed) or pencils; no gripping or extra pressure, no drawing of outlines, no patching or retracing of poorly written outlines, no unnecessary lifting of pen or pencil

2425 4525

Good penmanship, including correct proportion, slope, and direction checked by teacher from daily observation and inspection of homework and test papers

Good posture, indicated by keeping feet flat on the floor, both elbows on the desk, head up, body bent forward slightly with one hand holding the notebook flat on the desk

Proper use of the notebook

Daily dating of notebook at bottom of page and at the beginning of the day's work

Writing in columns a quarter or a half the width of the page on one side only to the bottom and to the end of the book before reversing

Gradually moving page up or in introducing thumb or finger under the left edge in order to turn it quickly with the free hand

Indicating end of letter dictated by leaving space or using significant mark

Making corrections in shorthand notes by circling errors and rewriting each incorrect or poorly written outline after comparison with the chalkboard or textbook models.

Showing completion of transcription of letter by line drawn through notes

Indicating place to begin notetaking by rubber band around used pages

Using any pauses to read and edit notes, inserting punctuation, indicating paragraphs, and improving outlines.

LESSON PLANNING

At all times the teacher must be aware of the general and specific objectives in advanced shorthand classes. To achieve these goals, carefully planned instruction and remedial work are essential. The teacher's daily lesson plan and suggested time allotments should provide for:

1. Material designed to build shorthand vocabulary or theory (3 min.)

   Short/brief forms and common phrases to be automatized

   Outlines chosen to review shorthand theory systematically and sequentially

2. Outlines to be previewed from the material to be dictated for speed building

   Practice on these outlines follows the accepted procedures for developing skill: reading of the outlines from the chalkboard by individuals or the class before written practice of the outlines, derivatives, and word families

3. Letters for skill building

   These are the letters which have been previewed. Provision should be made for applying these letters in a variety of speed-building plans. (Items 2, 3, and 4: 24 minutes)

4. Correlation with elements of spelling, vocabulary and meaning of content matter, applied to the skill-building letters

5. Outlines to be previewed from materials planned for transcription letters

6. Letters dictated for transcription

   These letters should increase students' vocabulary, develop language sense, enlarge business or cultural background, and inculcate desirable attitudes or traits of character. The letters should be carefully chosen to introduce matter of this kind sequentially. (Items 5 and 6: 9 min)

The homework should be:

Checked for thoroughness of preparation by short, spot reading in class (3 min).

Checked for completeness by inspection of collected homework

Assigned by number preferably by means of a duplicated chart covering a period of a month or term

Properly labeled and identified by pupils

Prepared according to explicit instructions given and carried out under the teacher's direction on the day of the first assignment

Planned to take 45 minutes a day and to cover approximately four sides of shorthand paper

Comprehensive to review theory, to develop skill in reading and in copying fluently, to improve spelling and written English; i.e., punctuation, paragraphing, and to increase knowledge of the business world through an understanding of the context of the letters

Completed under good study conditions at home (See p. 51.)

Varied to take care of individual differences; e.g., remedial work for weak students, extra credit or bonus letters for the bright

Prepared in a notebook reserved for this purpose only

The use of records or tapes for additional practice at home or in a place set aside for this purpose in school is recommended. This is especially valuable as a means of maintaining and building skill during holiday periods.

PLANNING LESSONS FOR SECOND YEAR STENOGRAPHY

Two guides for lesson planning follow. These guides are not designed to represent model or ideal lesson plans, but rather to serve as a frame of reference for considering the elements that experienced teachers have found significant in planning the lessons for a week and planning the lesson for a day. Each teacher should prepare a plan to meet the needs of his students.

Lesson Plan for Stenography 3

Dictation text: Transcription Dictation
Student's text: Gregg Transcription Simplified

Aim

To develop ability to take dictation at 60 wam for transcription

To extend shorthand reading and writing vocabulary

To review brief forms and derivatives

To strengthen correlated English skills, such as spelling, punctuation, word meaning

To broaden the perceptions of business procedures

Preparation

Homework review of letters 221, 222, and 223; oral transcription by sampling of homework notes. Individual students may be called in random order to read a sentence while the rest of the class traces over outlines.

Dictate selected spelling words which students write in longhand in notebook. The words are then recorded on the board by a student, and the class compares and corrects spellings:

thoroughly depreciation (meaning) few days' time customary considerably normally description

2428 Sesas

A WEEK'S ORGANIZATION PLAN FOR STENOGRAPHY 3, 4

Homework (4 minutes)	Theory Review (4 minutes)	Speed Building (19 minutes)	Transcription Letters (13 minutes)
Monday: Spot check	Brief forms and/or theory words for homework	Test letters from previous week; provide remedial practices, redictation at higher rate	Introduction of topic week; suggested vocabulary; preview and dictation of three letters; silent reading in preparation for typed transcription
Tuesday: Spot check (Assembly Day)	Brief forms and/or theory words for homework	Five-minute take with final rate 10 wam above transcription rate on topic of week, if possible; Pyramid Plan; oral transcription of entire take.	
Wednesday: Spot check	Brief forms and/or theory words for homework	Three letters of approximately 100 words each, from dictation test, on topic of week; Step-Stair Plan	Preview and dictation of four letters on topic of week; silent reading in preparation for transcription
Thursday: Spot check	Brief forms and/or theory words for homework	Three homework letters in three one-minute spurts beginning ten wam above rate for transcription letter.	Preview and dictation of four letters on topic of week; silent reading in preparation for transcription
Friday: Letters read completely, with oral punctuation and paragraphing	Brief forms and/or theory words for homework	Three letters on topic of week at four wam higher than transcription letters. Oral transcription.	Weekly test

The sequence of activities should vary each day.
Specific letters may be assigned to each row for transcription.
Transcripts are corrected in last five minutes of transcription period. Some papers are collected and corrected daily.

Theory Review

List on the board in shorthand the following brief forms and derivatives, which the students read in unison and individually. The outlines are then dictated for written practice:

COMPANY ACCOMPANY ACCOMPANIES ACCOMPANIED
ACCOMPANIMENT
KEEPER KEPT BOOKKEEPER HOUSEKEEPER
GENERAL GENERALLY GENERALIZE
PART PARTED IMPART DEPART PARTNERSHIP

2429 8525

Speed Building

Implement the Step-Stair Plan on letters 65, 67, and 77. Place the following preview outlines on the board:

APPROACHES COVER COUNTY TO-MAKE BUSIER
ONE-OF-THE-MOST PROFITABLE HISTORY EQUIP IMPROVE
SINCERE PLEASANT PLEASURE CASHIER HONOR EXHIBIT TO-ME
LONG-TIME-AGO UNDERTAKING CONGRATULATED FORWARD
REPORT HELPFUL WITHOUT WISE BUYER FUEL LOWEST
THEY-WANT WEARY FINANCIAL

Read the preview outlines and dictate for practice. Dictate letter 65 at 70 wam. Give additional outlines and dictate letter 65 at 80 wam. Dictate letter 67 at 70 wam. Read the preview again. Dictate letter 65 at 90 wam, letter 67 at 80 wam, and letter 77 at 70 wam. Read preview again. Dictate all three letters at 70 wam. Provide for sampled oral transcription.

Review spellings of
questionnaire congratulate sincere convenient financial

Dictation for Transcription

Preview letters 75, 76, 79, and 83. Provide for concert reading of preview outlines before the written practice. Identify spelling difficulties.

Dictate the letters at 60 wam.

Provide for silent reading; in preparation for the transcription.

Record the following words and phrases presenting transcription difficulties on the board:

safe-deposit box	*small-town*	*anxious*
reasonably	*advice*	*definitely*
federal	*planning*	*responsible*

Review the letters briefly for elements of comprehension, with the following questions.

What is the bank trying to sell in letter 75? How much do they charge? Find the commas in letter 76. Read the sentence which is a polite request. Read the last word in each sentence in letter 79. How many commas did you insert in letter 83?

2430 ICAS

Motivation

While shorthand is largely a self-motivating subject, student interest and attention can be maintained by

Students' awareness of immediate and long-range goals to be achieved

Students' ability to measure progress through achievement on tests (See p. 52.)

Students' training to do remedial work necessary to improve achievement

Teacher's recognition of students' progress through display of good work, by posting records of improvement on individual or class charts, and through oral or written commendations for good performance, effort, and improvement.

Students' appreciation of the social and economic importance of the skill to be attained by a knowledge of job standards, Civil Service requirements, etc.

2431

TECHNIQUES OF INSTRUCTION

The transcription of shorthand outlines into a meaningful, mailable letter attractively arranged and carefully edited is a complex process involving many skills. The techniques for developing these skills are treated below.

ABILITY TO TAKE DICTATION

This is fundamental to all other skills. Unless the student "gets" the material dictated, the other skills are useless. To develop this ability the teacher must plan a comprehensive, sequential varied program. This should include:

Penmanship, Posture

Constant stress on penmanship, posture, and correct use of writing tools and notebooks.

Tracing

Training students to rewrite, trace, or shadow-write whenever shorthand is being read either from homework or from dictated matter.

Vocabulary Development

Continued emphasis on the development of a functioning shorthand vocabulary through automatization of short/brief forms and common phrases, review of shorthand theory, preview of outlines in material dictated, postview of difficult outlines in unpreviewed material which has provided the students with opportunities for outline initiation.

Word-Retention Capacity

Development of word-carrying capacity by suggested techniques, such as

Dictating a sentence while the students listen, permitting them to write only when the sentence has been completely dictated. The teacher must, of course, choose sentences of suitable length.

2432 ESAS

Dictating in "spurts" and then pausing until the students catch up.

Dictating to keep the material consistently several words ahead of the students taking dictation. At first dictator should no be more than two or three words in advance of the students; later he may be several phrases or an entire clause ahead of the students. Of course, this approach must be modified to meet the needs of a class of students having different levels of ability.

Speed-Building Plans

Using a variety of speed-building procedures to stimulate and achieve speed, accuracy, and endurance. (Dictation for typed transcription should generally be at least 10 wam lower than initial speed-building levels.) Some recommended plans for the speed-building phase, are:

Grubb's Stair-Step Plan (Time required is 20 minutes for four letters.)

Choose letters of 80 to 100 words in length. If class is writing at 60 wam proceed as follows:

1. Preview first letter; dictate at 70; give additional outlines if necessary.
2. Preview letter two; dictate letter one at 80 and letter two at 70. Reread previewed outlines and give any others requested by students.
3. Preview letter three; dictate letter one at 90, letter two at 80 and letter three at 70. Reread preview and give additional outlines.
4. Preview letter four; dictate letter one at 100, letter two at 90, letter three at 80 and letter four at 70. Reread all of preview; repeat dictation if necessary.
5. Dictate all letters with 15 second pause between each at 80 wam.

Step-Stair Plan

Choose letters as in previous section; preview in the same manner, but start dictation of the first letter at the highest speed and move downward.

One-minute Speed Builder

Choose three letters (for illustrative purposes) at 90 words each and proceed as follows:

2433

Preview first letter; dictate at 60. Preview and dictate one minute at 70. Reread preview and dictate one minute at 80. Dictate letter at 90 and repeat if necessary.

Follow the same steps for letters two and three.

Read all previews: dictate all three letters at 70 words a minute. The letters should be read by pupils individually or in concert.

Give spurt-dictation and planned uneven dictation to break skill plateaus. If pupils are writing at 60 words a minute, dictate at 80 words for half minute; then at 120 for a quarter minute.

Progressive Dictation

This is dictation at uniformly accelerated speeds to enable students to progress from one skill plateau to the next. For example, dictate at 80 wam for 20 seconds; 100 for the next 20; 120 for the following 20; and 140 for the last interval.

Leslie-Zoubek's Speed Forcing Plan (Time required is one period.)

Select a letter or several letters with a total of 400 words and follow this plan:

Preview the first 100 words and read.

Dictate one minute at 60; redictate at 80 wam; reread preview.

Dictate one minute at 75 wam and have pupils read.

Reread preview and redictate for one minute at 90 wam.

Reread preview and dictate at 100 wam.

Repeat steps one through five for the next 100 words; dictate the entire 200 words at 100 wam and have half of the letter read back.

Repeat the preceding steps for the next 200 words.

Dictate the entire 400 words at 80 wam.

A suggested variation of the plan retains the same number of words in the dictation but changes the time in each dictation span.

Preview as in the preceding section in every instance.

Dictate the first 90 words at 60 wam for 90 seconds.

Dictate the same material in 75 seconds and then in 60 seconds.

Repeat steps 1, 2, and 3 for each group of 90 words in the selection until all material is covered.

Dictate the entire selection at 80 wam.

2434

Blanchard's Pyramid Plan (Time required is 30 minutes.)

Select new matter of 400 words in length. The night before assign preview outlines for homework.

Dictate 300 words of the selection at 60 wam; first half is read back.

Dictate for four half-minutes at 100 wam, stopping for a few seconds after each half-minute; last two half-minutes are read back.

Redictate the above material at 90 wam without pause; i.e., two minutes at 90; half of take is read back.

Repeat step two for the second half of the material, i.e., four half-minutes at 100 wam; second half of material is read back.

Redictate these four half-minutes at 90 wam without pause; first half is read back.

Give students an opportunity to rest before redictating the entire 400 words at 80 wam; last 200 words of take are read back.

Grubb's 3 x 4 Plan

Assume that the class can now comfortably write at 70 wam, and your next goal is 80 wam. Thoroughly preview all outlines before beginning, and repeat the preview for each step of the take.

Select new matter of 240-word length.

Dictate for one-half minute at 120 wam.

Dictate the next group for one half-minute at 120 wam.

Combine both half-minutes (one minute) at 100 wam.

Next, dictate the third half-minute at 120 wam.

Dictate the fourth half-minute at 120 wam.

Combine the third and fourth half-minutes (one minute) at 100 wam.

Now combine all the material dictated to this point, for three minutes at 80 wam.

This plan should be reserved for development levels of 60 wam and above.

Dictation for Transcription

Dictation of letters for transcription in the following progressive approach from the beginning of the term:

2435

Material assigned and written for homework

New material with previews. At least ten percent of new material should be selected for preview at the beginning of the third term and the amount gradually decreased as the term progresses.

New material without previews. (Postviews of outlines with which students have experienced difficulty should be given quickly, willingly, and without comment) This material should be:

Graded in difficulty from simple familiar vocabulary to more complex vocabulary

Increased in speed from 50 wam at the beginning of the third term to 90 wam at the end of the fourth term

Varied in length from a minute or a minute and a half to five minutes

Increased in syllabic intensity from 1.3 to 1.4, with occasional extension to higher intensity

These letters should cover as wide a range of business activities as possible in order to acquaint students with the vocabularies of various businesses and activities. A logical sequence for the increase of speed and difficulty should be adopted.

ABILITY TO READ NOTES FLUENTLY

The transformation of the shorthand outlines in a letter into a meaningful, sensible message should be the students' prime consideration in reading shorthand notes. To build this skill there should be

Continued emphasis on fluent reading of plate notes at increased rates.

The homework assignment should require that reading of plate notes precede the copying of this material.

Oral transcription should be at a rate fluent enough so that the meaning of the sentence is not impaired. Prompting by the teacher where pupil hesitation indicates difficulty in recognizing an outline helps to achieve reading with meaning.

Continued stress on the writing of well-proportioned, legible outlines in correct form and style. Occasional dictation at a rate well within the students' ability will clearly demonstrate the ease with which legibly written outlines can be read. Care must be exercised, however, to preclude the pattern of blocking for the purpose of outline perfection.

Increasing students' vocabulary by:

Holding them responsible for the meaning of words which occur in the homework assignment

Defining words in letters to be dictated to facilitate understanding of the context

Selecting dictation material covering a wide range of business situations and a variety of businesses.

Encouraging student application of language sense in reading poorly executed outlines or in supplying omitted words or phrases. Students should be reminded of the benefits to be derived from an extensive reading of books, magazines, and periodicals.

Developing techniques to assist students to read material written under pressure. Students may be instructed:

1. To follow the reading of dictated material with pen or pencil in hand, prepared to insert missing words or improve poorly executed outlines

2. To read letters silently before oral or written transcription

3. To supply the meaning of badly written outlines through a systematic approach:
   - Skip the word presenting difficulty, and read the sentence to get the complete thought.
   - Substitute synonyms for missing word until one corresponding to the outline is found.
   - Write the words before and after the outline in longhand on a separate piece of paper.
   - Write in longhand the identifiable strokes of the outline.
   - Insert the word which completes the thought.

4. To develop a logical plan for interpreting outlines:

   Pitman and Gregg

   Analyze the symbols actually written in the outline.

   Make allowance for variation in size, slant, slope, proportion and position, resulting from haste.

   Select the word which fits into the context of the sentence.

2437

Pitman Only

Check all possible vowel sounds.

Try the outline in other positions.

Try hooks and circles on the other side of the stroke.

Adjust the shading of strokes.

5. To supply only one word for any blank left in notes, discouraging indiscriminate additions.

6. To avoid changing original notes, which may make it difficult to later read the outline correctly.

Typewriting Skill and Ability to Arrange Material Attractively

The pupil should bring to the transcription class a basic typewriting skill. A systematic program to maintain and develop this skill and to build transcription facility should be planned. This may be accomplished through:

A routine for daily warm-up at the beginning of the transcription period to include the Expert's Rhythm Drill, an alphabetic sentence, a facility drill, a sentence, etc.

Daily practice on a list of spelling words compiled from errors made on tests or prepared for daily homework

Repetitive transcription of brief forms or common phrases listed in shorthand on the board or in the textbook

Review of letter set-up

Weekly skill-building drives culminating in a timed writing

Frequent review of numbers and special characters

Review of tabulation and practice in arranging tables of varied and increasing difficulty to prepare pupils for this part of the Regents Examination in Combination Shorthand, Typewriting, and Transcription. Care must be exercised to avoid undue emphasis on this element at the sacrifice of shorthand and transcription skills. Some teachers prefer to delay this aspect until a few months prior to the Regents examination. Other teachers prescribe the planning of the tabulation problem for homework.

Preparing carbon copies and envelopes

2438 CEAS

Training in making needed corrections include:

Erasing neatly and correctly moving the carriage away from the key basket; rolling the cylinder up to a convenient point; using short, light, circular strokes of the eraser to remove the error; placing a shield over the carbon paper; realigning paper and retyping with light strokes; keeping both eraser and fingers clean to avoid smudges on the paper

Spreading and crowding

Reinserting and realigning paper

Using erasable bond paper and correction coating devices

Developing in students an awareness of costliness of excessive erasures in time and production

Care of the typewriter to keep it in good working order

Replacing ribbons

Training in systematic organization of desks, notebooks, paper, and supplies

ABILITY TO TRANSCRIBE NOTES ON THE TYPEWRITER

The production of the mailable letter involves and depends upon all the component skills and knowledges developed. The successful development of the mailable transcript is a gradual process and may be achieved through these procedures:

1. Transcription of letters written in shorthand is presented in progressive steps:

   Shorthand plates of simple material, read by the class and by individual students are analyzed for punctuation and spelling difficulties, then typed sentence by sentence by the class. The material may be set up in either manuscript or letter form. This phase should not ordinarily extend beyond the first week or two of the third term.

   Letters are copied from shorthand plates for homework and prepared for transcription as suggested above. This phase may continue for the next week or two.

   Shorthand notes of familiar matter are taken from dictation and carefully prepared for transcription.

   Shorthand notes are taken from dictation of unfamiliar material liberally previewed at the beginning and prepared for the first few weeks by oral transcription, later by silent reading by the students to obtain an understanding of the context, to interpret outlines and

2439 8CIS

to insert paragraphing and punctuation. The major allocation of time during the second year will be devoted to this phase.

Shorthand notes of unfamiliar matter, without preview, are taken from dictation. This, of course, is the ultimate objective of our skill development.

"Cold notes" of letters dictated the preceding day are transcribed. This is an occasional approach designed to introduce variety and higher levels of activity.

2. Training in correct techniques includes keeping eyes on notes and maintaining a smooth, uninterrupted movement of the typewriter.
3. Establish the habit of looking up the spelling of words before transcription to eliminate hesitation and to increase speed of transcription.
4. Require students to correct recognized errors immediately
5. Encourage students to ask for help so that the teacher may analyze their difficulties and make appropriate suggestions.
6. Training in careful proofreading by checking the transcript line by line against the shorthand notes while the letter is still in the typewriter. Encourage students to adopt a critical attitude of looking for unrecognized errors.
7. During the early stages, the practice of placing a check against each shorthand note may be used to insure the transcription of every outline. Some teachers prefer to have students apply this technique to examinations only, fearing that inordinate investment of time will interfere with production skills. Additional proofreading practice may be obtained from the correction of mimeographed material containing errors frequently overlooked or `of printed exercises which have been prepared by some business firms for this purpose.
8. Stress an accurate verbatim transcript and simultaneously provide for the development of intelligent substitution skills. Many teachers defer substitution practice to the period immediately preceding the Regents examination.
9. Provide a program of remedial work for each individual based on daily observation and record of achievement of regularly scheduled tests.
10. Provide students with a knowledge of the results of achievement as soon as possible. This may be accomplished by:

2440 FEB

Checking papers of some pupils at their desks at once.

Collecting papers from part of the class according to some prearranged plan which should make provision for the checking of the papers of every student during the course of a week.

Pupil checking of transcripts five minutes before the end of the period from the teacher's reading, which should elicit or stress elements of obvious difficulty, such as spelling, meaning, punctuation, typing style, proof-reading, and shorthand.

Having the students exchange papers and checking from the reading by the teacher

Using the overhead projector to display the transcript

Displaying perfect transcripts and recording the results on a chart is an effective motivating device. Requiring a minimum number of mailable letters per week sets a definite goal for achievement and stimulates students to higher levels of attainment.

ENGLISH AND THOUGHT CONTENT IN TRANSCRIPTION

The pupils' understanding of the thought content of the dictated material and their facility in using the conventions of written English must be developed concurrently with the abilities previously discussed. Attention should therefore be given to the following procedures:

1. Planning a systematic program

   To improve spelling through daily practice on words commonly misspelled (see Appendix) or remedial work on words misspelled on tests. Students should keep an individual list of errors. This technique must be reinforced by a regularly scheduled testing program.

   To build vocabulary by distinguishing between homonyms and other words frequently confused: e.g., affect, effect; advice, advise; and by defining words occurring in homework or dictated letters.

   To apply the rules of punctuation, syllabication, capitalization, hyphenation, and paragraphing. The basic rules for the use of the comma should be stressed.

   Parenthetical words, phrases, and clauses are generally set off by commas.

   Words, phrases, and clauses used in a series are separated by commas.

2441

Introductory words, phrases, and clauses ("if" clause, "when" clause, etc.) are set off by commas.

Words, phrases, and clauses in apposition are set off by commas.

Non-restrictive phrases and clauses are set off by commas.

To develop a knowledge of the preferred style for the expression of numbers and symbols. A department or published style manual is helpful in keeping instruction uniform.

To use the dictionary efficiently.

2. Dictating in a natural way with proper emphasis so that students' attention is focused on the thoughts conveyed, rather than on the individual words.

3. Training students to listen for the teacher's pauses and inflections during dictation. This will facilitate the placement of commas and require students to insert end-of-sentence punctuation.

4. Allowing a period of silent reading during which students insert punctuation, indicate paragraphing, look up spelling, and ask questions concerning the conventions of written English.

5. Acquainting students with common business expressions and activities by explaining or summarizing the contents of a letter, by developing concepts of business procedures, and by amplifying vocabulary meanings.

6. Encouraging students to expand their cultural and business background by wider general reading.

TEACHER ACTIVITY DURING TRANSCRIPTION PERIOD

The transcription period is a teaching period and the alert, interested teacher will use this time to give necessary class instruction but especially to discover the difficulties of individual students and to give immediate remedial work. During this period, the teacher should:

Observe, encourage, and help individual students. For specifically identified weaknesses, provide remedial exercises. These weaknesses may include inability to distinguish between present and past tenses, between plural and singular forms, and failure to recognize agreement of subject and verb.

For the individual student, identify errors of technique as they occur and provide remedial practice. For the group, defer class

2442

36 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

remedial activity until the end of the period to avoid interruption of the transcription process.

Illustrate common difficulties at the chalkboard so that the class can overcome them.

Be alert to correct poor typewriting and transcription techniques.

Watch erasing to see that carriage is moved to extreme right or left, avoiding clogging the key basket with eraser dust.

Help students overcome any difficulty in using the dictionary and reference manuals.

Observe proofreading technique, and insist that proofreading be done according to instructions.

Time transcription production and motivate to higher goals.

Correct transcripts according to plans suggested. (See p. 91.)

Use the last few minutes of the period to summarize or review problems.

TIMING THE DICTATION

While there is a body of evidence to indicate that syllabic intensity is not the most significant measure of difficulty, the standard word of 1.4 syllables continues to serve as a base in most textbooks.

There are two general approaches to timing the dictation to conform to accepted usage of the standard word count. The teacher may modify the number of seconds required to read the 20-standard-word group, or the teacher may notate the materials to indicate the ¼-minute word count.

Tables for identifying either approach are included in Appendix T.

There are stop watches available which simplify the timing procedure by dispensing with calculations.

For the preparation of original test materials where a specific dictation rate is prescribed, it is generally preferable to mark off the material in ¼-minute intervals. This method is suggested.

Procedure	*Illustration*
a. Determine the rate of dictation desired.	90 wam
b. Multiply the rate by 1.4 to find the syllabic total.	126

12443 SDS

c. Divide by 4 to find the ¼-minute syllabic content.	31½
d. Mark off groups at the syllabic unit determined in *c*.	32, 63, 95, 126
e. Indicate notation at nearest whole word.	
f. Where a fraction is calculated, compensate at alternate groups, as illustrated in *d*.	
g. Amounts, dates, addresses, time are syllabicated as though written in words.	$150 = 7 syllables

MULTICHANNEL ELECTRONIC DICTATION LABORATORY

The multichannel dictation laboratory is an efficient instructional approach that contributes to the effectiveness of shorthand instruction. In our classrooms the equipment consists of a taped input that is transmitted over an antenna loop encircling the room and a receiving instrument at the desk of each student.

The taped input may assume several forms, though the increasing practice in New York City is to use the *cassette* form which is in a large measure standardized and permits the purchase of dictation material or software from many sources. The use of an antenna loop obviates the hazard of trailing wires in the room. The receiving instrument generally provides options for selection of taped materials from three or four different programs of instruction. A headset similar to the type used on transcription machines is the listening device for individualized use; it is connected to the receiving instrument. In some systems, two headsets may be attached to one receiver. The multichannel description identifies the capability of the system to provide simultaneous programs.

All equipment used in the New York City schools offers additional facilities for teacher monitoring of students; selection, microphone, and loudspeaker rendition of any desired program for unison class activity; and input facilities for other sources that may be available, such as one-quarter inch tapes and records. Provision is made for the preparation of original taped materials to meet special needs.

Equipment may be moved from room to room, and thereby flexibility of use is provided; but a room must have a prewired antenna loop. The system is self-contained in a console that is portable and stores individual listening stations or receivers distributed to students' desks.

The effectiveness of the system is dependent upon the availability of appropriate materials and the extent to which teachers have been trained to use the equipment so that they can use it with assurance. It is desirable to utilize identical dictation material on each of the available channels so that appropriate learning experiences may be estab-

2445

lished. An increasing number of publishers are producing dictation materials that are correlated with their textbooks and are thereby providing options for adequate preparation and corrective processes. Materials are available for theory stages, for intermediate and advanced dictation stages, and for specialized areas such as medical and legal training.

ADVANTAGES

The advantages of this type of approach are:

Because of the novelty and variety of offerings, the system provides inherent motivation.

The teacher is able to monitor the selected program at the receiver of the student and note the strengths and weaknesses evidenced by the student as he takes the dictation.

The teacher may circulate through the room during the "take" and observe common and individual weaknesses in shorthand technique.

The use of multiple concurrent channels permits each student to select (or the teacher to prescribe) the rate of speed most appropriate to his skill-building process; in effect the teacher is providing instruction at varied levels of student ability.

The student learns to take dictation from a variety of voices and speech patterns, thereby contributing to the functional effectiveness of the learning process.

The problem of gearing the dictation rate to the medial ability of the class is in a large measure resolved, since several levels of ability may be accommodated concurrently.

Opportunities are increased for providing special tutoring either after school hours or in a supplementary class.

Provision is made for each teacher to prepare original materials that will best meet special needs of the class or recognized instructional weaknesses.

The facilities can be adapted to meet individualized instructional programs in other areas of business education: machine operation, transcribing machine training, key punch operation. These programs can be so organized that different instructional programs are implemented concurrently.

RECOMMENDATIONS

The following suggestions for effective utilization of a multichannel system are the product of the experiences of several years of classroom application.

Specific operational instructions should be available in mimeographed form. An illustrative Instruction Sheet is contained on page 111 and is designed to serve as a format rather than to constitute specific instructions.

The teacher should practice assembling the equipment until he feels comfortable with its use and has eliminated apprehension. In this connection, it is most important that the teacher delay any evaluation of the effectiveness of the system until he has used it for at least several weeks.

Mimeographed materials should be available, identifying and describing the materials contained on tape units. An illustration of this type of information is included on page 110.

One or two students in each class should be trained to distribute and collect receiving sets, and to organize and reassemble the console. However, the teacher must always retain his status as supervisor and expert.

A schedule for five-day (weekly) utilization of the system should be organized on a period basis, with room or class designations indicated. While it is desirable to adhere to such schedules, a degree of flexibility must be provided to meet emergencies. An illustration of such a schedule appears on p. 113.

The input devices and the transmission units should be permanently wired to avoid time-consuming and disconcerting setting-up procedures.

Security precautions must be applied to preclude theft. The input and transmission units may be permanently anchored to the top of the cabinet, or an additional protective covering with locking devices may be affixed.

If scheduling practices permit, it would be preferable to identify a specific room as the shorthand dictation laboratory, to install permanently all units including the receiving sets, and to assign shorthand classes exclusively to this room.

Students may be sensitive to the sharing of ear pieces. This problem may be resolved either by providing a bottle of rubbing alcohol

2447 2448

available for cleansing use, or by providing each student with a personal earpiece cushion.

While the primary impact of this system is on the post-theory phases of shorthand instruction, carefully planned applications may be made in the theory stages.

The dictation laboratory should be used at planned intervals that contribute to the objectives of the suggestions included under Recommendations; but the significant emphasis must rest upon direct teacher-applied dictation and transcription patterns.

The dictation materials must be carefully previewed and selected to conform to the specific levels of pupil ability and the subject matter contained.

It is important to recognize that taped dictation programs are designed to be supplementary teaching devices which enable the teacher to engage in additional corrective activity.

During the automatic dictation interval, the teacher should circulate through the room consistently, observing the techniques of the students and identifying their common and individual weaknesses. Some experienced teachers leave a memorandum on the student's desk, with corrective suggestions.

As in all aspects of the teaching-learning process, it is advisable to introduce both the length and complexity of materials on a progressive basis. The first day the system is introduced to students, a one- or two-minute take is adequate; as the term advances, the duration of automatic dictation activity may be increased, but rarely should it exceed 15 minutes of uninterrupted application.

MEASURING PROGRESS

CONSTRUCTING AND ADMINISTERING TESTS

The building of skill in transcription depends not only on effective organization of the work and skillful techniques of teaching but also on a specific periodic testing program. Tests should be:

Scheduled regularly, approximately once a week.

Measurements of what has been taught; e.g., specific rules of punctuation, English and shorthand vocabulary. Many textbooks are organized on the basis of specific business topics. Administering tests using terms common to the field would be appropriate at the end of the unit.

Graded in difficulty from week to week. The length of the letters, their syllabic intensity, and the speed of dictation are factors which must be considered.

Corrected and returned promptly.

Followed by individual and class remedial work based on the errors occurring in the test.

Administered and rated according to the rules for rating transcripts on the Combination Shorthand, Typewriting, and Transcription Regents Examination. The New York State Education Department booklet, *Guide for Administering and Rating Regents Examinations in Business Subjects,* is available for this purpose.

SUGGESTED TEST GOALS

The schedules opposite illustrate planned weekly goals:

Where uniform midterm examinations are given, tests may consist of the transcription of three letters out of four. This may be equated to 100 per cent; or a timed-writing, spelling, and/or vocabulary test may be used for 25 per cent; or the Regents scale may be applied for an included tabulation problem.

2449

Letter length at *a* is 90 to 100 words; at *b*, 100 to 110 words; at *c*, 120 words.

A bonus of five per cent may be given for completion of a third mailable letter at any stage of development.

	Third Term Speed				Fourth Term Speed		
		Week	*Plan A*	*Plan B*		*Week*	*Plan A*	*Plan B*
Dictation and transcription of three letters; students to transcribe any two. Syllabic intensity 1.4	(a)	3	46	50	(c)	1	66	70
		4	48	50		2	66	70
		5	50	50		3	68	70

	(b)	10	60	60		8	78	80
		11	62	60		9	80	80
		12	64	65		10	82	80
		13	66	65		11	84	80
		14	68	65		12	86	85
		15	70	70		13	88	85
		16	72	70		14	90	85
						15	92	90
						16	94	90

Some teachers, in the second half of the year, prefer to dictate four letters and to require students to transcribe three, with a bonus for a mailable fourth. The marking scale may be modified to accommodate this approach.

MARKING SCHEDULES

Stenography 3: Value of each letter is 50%.
Major errors (as defined in the Regents marking schedule) equal a 3% or 4% penalty.
Minor errors equal a 1% penalty.

Stenography 4: Value of each letter is 50%.
Major errors (as defined in the Regents marking schedule) equal a 4% penalty.
Minor errors equal a 2% penalty.

2450

Third-Year Shorthand (Advanced)

OBJECTIVES

The third year is devoted to the development of the competent secretarial worker who is able to use stenographic skills at a higher level in more diversified applications. Specifically the following goals are established:

- To extend the level of skill in both stenography and typewriting
- To develop the ability to take comfortably and to transcribe letter material dictated at 120 words a minute
- To review and expand transcription techniques to include common written communication forms such as memoranda, reports, articles, multiple copies, in varied formats
- To edit transcripts
- To take and transcribe office-style dictation
- To reconstruct letters from notations given by the dictator
- To increase stenographic production of mailable letters in quantity, at transcription rates consistent with business standards
- To take sustained uninterrupted dictation for periods of from three to five minutes for transcription purposes
- To use reference books and office manuals effectively
- To prepare for employment tests and Civil Service examinations

CLASSROOM ACTIVITIES

Instruction in third-year shorthand will involve all the elements of second-year shorthand. There should be a more extensive coverage of activities requiring secretarial skills. The teacher must be aware of the wide range of student ability at this level and be alert to constantly changing office procedures and equipment.

The dictation patterns of the second year should be complemented by the following devices:

2451 0845

Using articles and editorials
- Stressing ability to initiate new outlines
- Stressing the meaning of material dictated

Using Civil Service material
- Stressing the ability to follow directions
- Stressing the accuracy of the transcript
- Stressing the ability to take dictation from unfamiliar voices
- Stressing the ability to take dictation under tension

Providing office-style dictation
- With corrections, additions, and deletions made during dictation
- With reading back interspersed during the dictation of the letter
- Taken under especially difficult situations; e.g., voice deliberately muffled, speech unclear, etc.
- Started while class is engaged in another activity
- Dictating information to be included in a letter which students compose

Using records or tapes

Using multi-channel equipment at varying speeds

Inviting visitors to dictate

Using cold notes
- Reading of letters dictated on previous days
- Finding and reading specific portions of letters dictated on previous days

Reading and transcribing notes of another student

Positions of writing
- Taking dictation while standing
- Taking dictation with book in lap

TECHNIQUES

The techniques of skill development follow the same pattern as those for second-year shorthand. (See p. 81.) The material selected for transcription should include the following:

- Form letters
- Letters with inserts

2452

Letters with postscripts
Letters of more than one page
Interoffice correspondence
Postal cards
Telegrams, cablegrams, and radiograms
Letters of application
Civil Service material

Typewriting activities in connection with production should include:

Typing corrected copy
Typing handwritten copy
Using envelopes of various sizes
Typing letters or forms to be placed in window envelopes
Preparing invoices and statements
Typing on lined paper
Preparing multiple carbons

The use of multi-channel equipment is especially desirable in this grade to develop students' skills in accord with their individual levels of ability.

MEASURING PROGRESS

Suggested Goals for Final Tests

These tests require a thirty-minute transcription period with dictation and silent reading time provided within the preceding 10 minutes.

	Fifth Term		Sixth Term	
	Words a Minute	Number of *Words* Each Letter	*Words* a Minute	Number of *Words* Each Letter
Dictation and transcription of three letters of different lengths, students to transcribe any two, one with carbon and envelope, approximately 1.4 syllabic intensity	90 - 105	100 - 175	105 - 120	110 - 180

Since the abilities of students at this level are likely to cover a wide range, it is desirable to design tests to be dictated at different rates to provide for individual differences.

2453

Marking Schedule

Stenography 5 and 6: Value of letter equated with the length or speed; e.g., the shortest letter, 40%; medium, 45%; longest, 50%
Carbon and envelope, 5%
Major errors (as defined in the Regents marking schedule), 4%
Minor errors, 2% for each error.

Specialized Classes

In schools where the organization permits some or all of the following programs may be set up to serve the special needs of students:

RAPID ADVANCEMENT CLASSES: These classes are formed to

Permit the completion, by business or academic students, of two years of stenography and the taking of the Regents examination in a year and a half, with the other half-year available for a double period of Secretarial Practice.

Permit students to be selected from the normal classes at the end of the first year of stenography on the basis of teacher recommendation or qualifying marks in stenography, typewriting, and English.

Complete a year of transcription in one term.

Constitute "honor" classes if there is a sufficient number of students for a class; otherwise, students may be assigned directly to a Regents class instead of to Stenography 3. Under the latter conditions, students usually do very well after a preliminary period of adjustment.

MODIFIED CLASSES: These classes are formed to

Provide either an additional term or year of instruction, or double periods in the first and sometimes the second year, for the completion of the normal two-year course of study.

Furnish an opportunity for a successful experience in vocational training for selected students with certain types of problems (learning, language, emotional, etc.). The extra time is needed to afford opportunities for individualized remedial activity to prevent failure, to help build a good self-image, to strengthen identification with desirable social and economic goals, and concomitantly, to increase interest in school, to prepare for a marginal stenographic

2455

position, and to provide a basis for additional training after graduation.

Use all, or the greater part, of the three terms for theory when the additional term is scheduled. Where double-period classes are scheduled, the same rate of coverage is expected as that for normal classes.

De-emphasize verbalization and abstractions in the presentation of theory and concentrate on the automatization of a basic vocabulary through extensive and intensive drill, and devote more time to compensating for language weaknesses.

ACCELERATED STENOGRAPHY: Generally this is a one-year course offered to academic students in their junior or senior year.

In addition to the aims of the regular stenography course, these classes are designed to:

1. Meet certain additional needs, such as:
   - To assist students to take lecture notes
   - To prepare students for summer and/or part-time positions
   - To equip students for initial employment in their chosen fields after college training
   - To make students aware of career opportunities where shorthand is essential; e.g., shorthand teaching, court reporting, bi-lingual secretarial work, etc.
2. Present the basic theory of Pitman or Gregg in one term.
3. Provide for transcription in the second term, where separate periods of stenography and typewriting are offered. This gives students the opportunity to take the Regents examination after one year of instruction. Where there are no separate periods for shorthand and typewriting, enrolled students must either demonstrate a reasonable competency in typewriting skill or be required to take a separate period of typewriting.
4. Emphasize the following elements:
   - Carefully planned lessons presented at a brisk tempo
   - De-emphasis on theory
   - Stress on reading and writing connected matter
   - Open-book dictation in each lesson from the beginning, starting at a rate of 40 wam

2456

Dictation of new matter toward the end of the first term

Skill building activities that will enable pupils to write at 50 wam on familiar matter for two minutes, toward the end of the first term

Many experienced teachers use this plan and time schedule for a developmental lesson:

Review of previous day's learnings through oral or (occasional) written transcription of homework	4 minutes
Dictation of connected matter from the open textbook	5 "
Reading of material dictated by spot check	2 "
Apperceptive base for new lesson	1 "
Motivation	1 "
Presentation of and drill on new theory learnings	10 "
Application of new skills and knowledges in short sentences, in plate reading and in open-book dictation	15 "
Summary	1 "
Preview of new assignment	1 "

In the second term, the practice is to follow the procedures of a normal transcription class with dictation beginning at 50 wam and increasing five wam every two weeks until 80 wam is attained.

SPANISH STENOGRAPHY

Makes it possible for students who are fluent in oral and written Spanish but who experience difficulty with English, to acquire a marketable skill which will prepare them to serve the business needs of our large Spanish-speaking community and of our export-import trade with Latin America

Provides an opportunity for the kind of learning experiences that instill a feeling of accomplishment, foster interest in learning, and strengthen the desire to stay in school until graduation

May be offered in conjunction with typewriting instruction from a Spanish textbook

May serve as a tool for motivating the improvement of English, especially if additional instruction in English shorthand is offered to these students

2457

Should be offered only in schools with large registrations of Spanish-speaking students. A competent teacher, highly qualified in both Spanish and in stenography, must be available to conduct the classes

LEGAL AND MEDICAL STENOGRAPHY PROGRAMS

May be offered instead of, or in addition to, Secretarial Practice, to students in the senior year who have passed the Regents examination and who have indicated an interest in qualifying for beginning positions in these fields

Should seek to acquaint students with the basic terminology of the field; develop familiarity with the various forms and records in common use; attempt to develop the stenographic, transcription, and typewriting skills required to apply these learnings in realistic situations with a degree of efficiency

May be given for one or two terms and are usually concluded with a culminating project that permits the students to follow a case through in sequence

GREGG NOTEHAND

Is offered in some schools to academic seniors who are college bound, to facilitate note-taking in college

Provides a general education, personal-use tool

Develops an approach for taking lecture notes which emphasizes selectivity in abstracting important ideas

Uses shorthand symbols together with alphabetic symbols

MACHINE SHORTHAND — (TOUCH SHORTHAND)

Is particularly desirable for those students who have a good academic background, who possess better than average ability in written English, and who are interested in careers requiring high speed; e.g., court reporting, recording conferences

Has been found helpful for the student who has experienced difficulty with a symbol system of shorthand but has a successful, scholastic record

Is presently offered to seniors both as a one-year course on a double-period basis, or as a two-year course on a single-period basis

2458

Strives for a speed goal of 80-100 wam with a typewriting goal of 40-50 wam.

Should be subject to the following conditions:

Availability of a machine for students' home practice, for maintaining skill level after graduation, and for employment testing

Assurances of jobs for graduates of the course.

SPEEDWRITING

Is an alphabetic system of shorthand taught in several city schools.

Is offered on a single-period basis for one term or one year to seniors with good scholastic records in all subjects in the academic program.

Generally covers the twenty-five theory lessons in twelve weeks; then devotes three weeks to speed development and three weeks to transcription skill building.

May qualify selected students to pass the Regents examination.

May serve a vocational goal if student reaches competency of 80 wam.

2459

WORK EXPERIENCE PROGRAMS

The alternate week supervised cooperative work experience program should be available to students who need, want, or can profit from the experience. This program assumes that the shorthand student is assigned to a position which contributes to the educational objectives of the shorthand training program. Students who participate in the program must:

> Have reached that point in their training where their shorthand skill is usable
>
> Be placed in a station where the skill will be developed further by functional training

If the preceding conditions are not met, then learning difficulties resulting from the reduction of shorthand instruction will interfere with the development of a marketable skill. The possibility of failure may encourage students to drop the subject.

The half-day work experience program may be offered to seniors. This program mitigates many of the disadvantages of the alternate-week program for stenography students because the students

> Have usually completed their skill training or are in the final stages of it and are ready, or almost ready, for the kind of work they expect to do after graduation
>
> Have the maturity and motivation to appreciate the importance of orientation to the world of work and to benefit from such orientation

Here, too, the precautions of relating the job to the student's level of training must be observed. On-the-job experience must complement the school program and enhance the value of the schooling; the in-school program must be correlated with job experiences and contribute to the educational value of the work station.

Cocurricular and Extracurricular Activities

A course of study in stenography can be enriched by introducing many activities which will motivate students to work to the best of their ability, help them enjoy the time and effort they invest in learning, increase their understanding of the business world, and give them an opportunity to practice some of their skills in a realistic setting.

CLUBS

The effectiveness of a club program is determined by the interests and needs of the students in a particular school situation and the availability of an enthusiastic, imaginative teacher-sponsor.

Some of the more representative clubs currently being conducted in our city schools are listed below.

Stenography Club:

- Offers assistance to weak students in need of coaching
- Provides high speed dictation and transcription practice for better students
- Is specialized in function to provide experiences in medical and legal stenography, court-reporting, etc.

Stenography Honor Society, which is organized for outstanding business students who meet scholarship, personality, and school service requirements

Future Secretaries of America which:

- Acquaints outstanding students with the Certified Professional Secretary program
- Provides experiences which will help its members to establish the basis for future certification

Future Teachers Club, which may be oriented to have a specific appeal for academic students who are encouraged to become stenography teachers

2461

CLUB ACTIVITIES

Enrichment

Participation in audio-visual programs in the secretarial field with ensuing opportunities for information forums, panel discussions, etc.

Field trips to career conferences, to various types of business establishments, to institutions of higher learning in the business field, to Junior AMS meetings, etc.

Specific Purpose

Coaching for examinations: Regents, Civil Service, job proficiency, interviews, etc.

Preparation of department or school newspapers or magazines

Preparation for contests

Service

Maintaining attractive and current department and classroom bulletin boards

Acting as clerical assistants in department offices for a wide variety of tasks

Providing secretarial help, such as the taking of minutes, for designated school activities

Serving as a visual-aids squad for the department

Tutoring fellow students

INCENTIVES AND AWARDS

Devices and techniques which arouse interest and serve as incentives to stimulate student enthusiasm are essential:

- To provide tangible goals toward which students can work
- To encourage greater effort and additional practice
- To inspire students to achieve to capacity in an effort to win recognition and approval from teachers and classmates in the form of certificates and awards
- To permit students to compare their achievement with that of others in the class, giving them a realistic appreciation of the level at which they can fill positions in the business world
- To teach the importance of winning and losing graciously

2462

Spelling Program: Students are given a master list of frequently misspelled words compiled by the Society. Certificates are awarded to those who achieve 100% accuracy on teacher-conducted 100-word test constructed by the Society.

2. Business Education Association of Metropolitan New York. Award programs sponsored by this organization are conducted by the Bureau of Business and Distributive Education.

   Certificates of Merit: End-of-year certificates are available for the student obtaining the highest class mark in each grade of Stenography.

   Kroll Memorial Award: A certificate to students receiving 100% on the Regents Examination.

   Altholz Award: A medal awarded to the outstanding graduate of the Secretarial Studies Department.

3. Dictation Disc Company, 240 Madison Avenue, New York, N.Y. 10016

   DDC Shorthand Improvement Award: Information relating to contests is provided in the regularly published DDC Record. A pin is given to the student in each shorthand class who in the teacher's judgment has made the greatest improvement during the school year.

4. Gregg Awards Program, Gregg Awards Department, 330 West 42 Street, New York, N.Y. 10036. Detailed information relating to many awards is available in the "Gregg Tests and Awards Brochure."

   Certificates and pins are available for a small fee.

   Honor Roll charts

   OGA Shorthand Penmanship Tests. Copy contained in *Today's Secretary*.

   Shorthand Dictation Speed Tests. Sustained dictation at speeds of 60, 80, 100, 120, and 140 wam for 3 to 5 minutes' duration. Copy in *Gregg Tests and Awards Book,* published annually.

   Shorthand Complete Theory Awards: 100 word tests. Copy in *Gregg Tests and Awards Book.*

   Transcription Tests. Timed transcript of dictation at 60, 80, 100, and 120 wam. Copy in *Gregg Tests and Awards Book.*

2464

5. Pitman Publishing Corporation, Awards Department, 20 East 46 Street, New York, N.Y. 10017. Information relating to contests and awards may be obtained from the publisher or in its publication, *The Pitmanite*.

   Honor Roll charts

   Shorthand Theory Awards: Intermediate and comprehensive levels. Copy in *The Pitmanite*. Certificates and pins available.

   Shorthand Speed Awards: Dictation at 80, 100, and 120 wam. Copy in *The Pitmanite*. Certificates and pins available.

   Transcription Awards: Plate material available in the *Pitman Journal*. Miscellaneous awards and Honor Transcript Certificates.

   National and International Shorthand Contests. Conducted annually. Copy provided directly by publisher. Medals, plaques, pins are available in different categories.

6. Individual School awards programs. Schools may establish certificates and medals patterned on the procedures presented in the preceding sections. The programs may be individually oriented or group oriented.

When possible, school-wide publicity should be accorded to all award winners. Their names and achievements should be posted on hall bulletin boards and listed in the school newspaper. The presentation of outstanding awards at a school assembly increases the effectiveness of this type of motivation.

ASSEMBLY PROGRAMS

In addition to their enrichment possibilities and the opportunities they provide for an expression of the interests of business students, assembly programs can be used to convey to all students the impact of New York City as the office center of the world and the values of the skill training offered to equip students for service in many fields.

Individually adapted variations of the following programs have been used successfully in many schools:

1. Plays and original skits, especially those that dramatize and make more meaningful specific areas of training, such as correct typewriting technique, applying for a position, office behavior, etc. These

2465 1248

productions may require a great deal of rehearsal time unless the scripts are planned to achieve effectiveness through a reading approach.

2. Outside speakers. The program may be based on presentations by successful graduates, by officers of the personnel or management offices of large companies, by representatives from civil service, institutions of higher learning, professional organizations (AMS, OEA, The National Secretaries Association, Business Advisory Commission, Commerce and Industry Association) to discuss careers, job requirements, educational opportunities, promotional areas, etc. Unless speakers are known to be unusually effective, a significant contribution to the presentation will result if a student panel is used to ask prepared questions of interest to students.

3. Demonstrations at the typewriter or at the chalkboard for stenography, by typewriting or shorthand champions, by court reporters, or by the students themselves either individually or in teams.

4. Occasionally, outstanding films are available from such sources as equipment companies and cultural, professional, public, or governmental organizations with messages of social or economic significance to the field of business. These films should be selected by the teacher on the basis of student appeal and educational value.

DEPARTMENT PUBLICATIONS

A department newspaper or magazine can be used effectively to create interest in the skill training opportunities offered by the secretarial studies department, to provide worthwhile experiences in the language arts so essential to transcription skill, and to reveal areas for placement.

To extend its appeal to all the students in a school, these publications may include features, such as:

Reports on current happenings in the school: outstanding assembly programs, trips to business offices, visits of guest speakers, descriptions of newly acquired equipment, etc.

Requirements for awards, graduation, and admission to institutions of higher learning in the business field

Job opportunities and requirements

Honor roll placement and award winners in a wide variety of categories

2466

Special features, cartoons with shorthand captions, puzzles in shorthand, etc.

Interviews with or reports on successful graduates

TRIPS TO BUSINESS OFFICES

Trips to business, professional, and government offices provide a background for much that is presented in the classroom and acquaint students with some of the actualities of the business scene. For maximum effectiveness, the project must provide for a preliminary visit to the office by the teacher, a briefing with students about proper behavior, and elements of interest, planning for transportation and lunch, a follow-up discussion of significant elements or a written committee report on items of importance and the preparation of letters of thanks.

TRAINING FOR JOB PLACEMENT

To meet the many testing experiences of a successful business career, students should be given training in taking employment and other civil service tests, in filling out application forms, and in conducting themselves properly at interviews. They should be encouraged to take civil service examinations and the New York State Employment Service Proficiency Test as part of a planned program of job placement.

SCHOOL-WORK EXPERIENCE

In many schools students serve in the administrative offices on a volunteer basis. If stenography or a high degree of skill in typewriting is required, the assignments should be coordinated by the department chairman in order to make available to outstanding students these valuable training and experiential opportunities. The job requirements should be reviewed periodically to make sure the assignments continue to be related to the desired objectives and contribute to skill development.

500 MOST COMMONLY MISSPELLED WORDS IN TRANSCRIPTION

Through the courtesy of the Dictation Disc Company, we are providing this list of the 500 words most frequently misspelled in transcription. The lists are organized in groups of 100 each, with the first group the most commonly misspelled words, the second group the next most common, and so on. Printed copies and dictation records of these words are available from the Dictation Disc Company.

First Hundred Most Commonly Misspelled Words

absence	appearance	decision	judgment	procedure
accept	appointment	definite	loose	proceed
acceptance	arrangement	description	lose	receipt
accidentally	assistance	develop	maintenance	receive
accommodate	attendance	difference	necessary	recommend
accordance	beginning	disappoint	noticeable	reference
accuracy	believe	effect	occasion	remittance
achievement	benefited	embarrass	occurred	representative
acknowledgment	business	equipment	occurrence	separate
across	calendar	equipped	omission	shipment
affect	cancellation	exceed	omitted	shipping
agreeable	cannot	excellent	opportunity	similar
almost	coming	except	personal	strictly
already	committee	existence	personnel	surprise
altogether	confident	extension	planning	their
among	convenience	familiarize	possession	there
analysis	convenient	fourth	practical	too
analyze	criticism	grateful	precede	undoubtedly
apologize	criticize	immediately	preferred	unnecessary
apparent	customer	incidentally	privilege	whether

Second Hundred Most Commonly Misspelled Words

accessible	applicant	defense	formerly	pleasant
accompanying	appreciable	deferred	forward	practically
acquaintance	approximate	delegate	government	practice
adapt	argument	desirable	governor	preference
adequate	article	development	guarantee	previous
adjustment	ascertain	eagerly	inconvenience	principal
admirable	attorneys	economical	knowledge	principle
advantageous	available	edition	laboratory	probably
advertising	budget	efficient	legitimate	purchase
advice	businessman	eligible	license	really
advisable	busy	eliminate	management	recognize
advise	campaign	endeavor	manufacturer	referred
usually	capital	envelope	merchandise	referring
advisory	collateral	especially	miscellaneous	repetition
aggravate	commission	exercise	oblige	respectfully
allowance	conference	experience	organize	schedule
annoyance	congratulate	explanation	original	secretary
annual	controversy	February	paid	seized
anxious	courteous	finally	partial	submitted
allowable	courtesy	foreign	permitted	succeed

Third Hundred Most Commonly Misspelled Words

accessory	correspondence	hardware	overdue	significant
allotment	correspondents	height	pamphlet	someone

2472 0725

anticipate	dissatisfied	indebtedness	particularly	specialize
bankruptcy	emphasis	independent	permanent	stationary
bargain	emphasize	indispensable	preliminary	stationery
basis	essential	individual	price list	substantial
bookkeeper	exaggerate	installment	quantity	successful
brilliant	excellence	inventory	questionnaire	sufficient
brochure	excessive	it's, its	quiet	superintendent
bulletin	expenditure	legible	quite	thorough
bureau	extraordinary	length	recently	throughout
career	extremely	maximum	recognized	typing
catalog	facilities	menus	renewal	until
choice	financial	minimum	requirement	valuable
choose	usable	mortgage	respectively	various
circumstances	forty	negotiate	response	vicinity
column	fulfillment	occupant	responsible	warehouse
concern	gauge	occurring	route	wholesale
conscientious	genuine	ordinary	salary	withhold
consignment	handled	organization	satisfactorily	worthwhile

Fourth Hundred Most Commonly Misspelled Words

accrued	concede	hazardous	magazine	professor
affidavit	consequence	hesitant	manuscript	psychology
appliance	continuous	identical	medical	reasonable
appraisal	controlling	illegible	modernize	recipe
architect	cordially	imperative	negligible	reimburse
assessment	council	impossible	neighborhood	restaurant
assignment	counsel	inasmuch as	nevertheless	securities
authorize	coverage	inducement	offense	simultaneous
beneficial	deductible	influential	offering	somewhat
beneficiary	deficit	initial	parallel	subscriber
capitol	depositors	inquiry	participant	supersede
casualty	director	intelligence	patronage	tariff
client	emergency	interfere	permissible	temporary
comparable	employee	interrupted	persuade	urgent
comparison	endorsement	investor	phase	vehicle
compelled	enthusiasm	itemized	pleasure	vendor
competent	favorable	justifiable	precision	visible
complement	furthermore	leisure	preferable	voluntary
compliment	grievance	letterhead	prejudice	volunteer
compromise	harass	library	premium	survey

Fifth Hundred Most Commonly Misspelled Words

accede	competitor	device	intercede	remember
accumulate	conceivable	devise	irrelevant	responsibility
acquiesce	concession	disappear	itinerary	ridiculous
acquire	concurred	discrepancy	jeopardize	salable
address	confidential	efficiency	liaison	serviceable
advertisement	conscience	enclose	likable	siege
allotted	conscious	enterprise	livelihood	sincerity

ILLUSTRATION OF INSTRUCTION SHEET FOR OPERATING THE ELECTRONIC LABORATORY

Students' Equipment

STUDENT RECEIVER: Small machine used by students to receive dictation

HEADSET: Located in cardboard box

Teacher's Equipment

CONSOLE: Large portable system containing sub units

POWER UNIT: Largest machine, located on left-hand side of stand

THREE DICTATION UNITS: Three small flat machines (Marked *A, B, C*). These serve as recorders into which the tapes are inserted.

MICROPHONE: To be plugged into center of power unit

STUDENT RECEIVER and HEADSET: To be used by teacher in monitoring dictation being received by students

To Operate:

Distribute to each student one student receiver and one box containing a headset.

Plug into wall outlets the two cords coming from the rear of the console.

On the front of the power unit.

Turn the power switch to the *on* position.

Flip up the three microphone *channel* switches.

Never turn the switches marked *A, B,* and *C,* located near the bottom of the power unit marked *dictation unit volume.*

Have students do the following with their headsets and student receivers:

Plug headset into the receptacle marked *student* at the side of the receiver.

Put the headset on, with the plugs in the ears and the rounded loop under the chin.

On the front of the student receiver, click the volume switch clockwise from *off* until the red dot points upwards. This

turns the machine on and makes it possible for students to hear.

Plug the microphone in to mike in the center of the power unit.

Talk into the microphone to the students to be certain that all can hear you. Have them adjust their volume switch to the desired listening level.

Explain to the students how the machine operates

Describe how they can select Channels *A, B,* or *C* for the three speeds of dictation.

Tell them the speeds of dictation on each channel.

Have each student turn the *channel* selector to *A, B,* or *C* depending on the speed desired.

Flip down the three microphone channels to *off*.

On the teacher's three dictation units (Marked in brush pen *A, B,* or *C)* turn each *channel* selector to the proper channel (from 1-20). See duplicated list of letters and speeds available on each channel.

On the power unit, flip up the three dictation units — power switches *(A, B, C),* and the dictation will begin shortly. (If you wish, only *A* or *B* or *C* switches may be used.)

During the dictation, you can stop the dictation flow by flipping down any or all dictation units — *power* switches to *off*. You can then speak over the microphone to any or all groups by flipping up any or all of the microphone — *channels* switches.

Instructions for Returning Tape to Beginning of Reel

Remove rubber stopper from the *Listen-Talk* keys.

Press forward the blue *Rewind* key on *A, B,* and *C* and keep depressed until you hear a thump.

Remember to replace the rubber stopper behind the *Listen-Talk* keys when you wish to start the dictation.

Instructions After Completing Use of Electronic Laboratory

On the power unit, depress the dictation units — *power* and *microphone* — channels switches to the *off* position.

Ask students to:

Turn volume control to *off*. (Very important or battery will be drained.)

2475

Detach headset from the side of the student receiver and return headset to the cardboard box.

Collect all materials from students and store in cabinet.

Have electronic laboratory wheeled to Room 410 and placed flush against the front of the file.

ILLUSTRATION OF SCHEDULE FOR USE OF ELECTRONIC LABORATORY

Changes in schedules may be made in consultation with chairman.

Additional periods may be scheduled at the option of teachers.

Pd.	Monday	Tuesday	Wednesday	Thursday	Friday

ABSTRACT - This publication of the General Aviation Manufacturers Association provides a listing of aerospace educational materials available for use by teachers and administrators in planning and conducting aviation and science curriculums at all levels. Listings are in alphabetical order by member manufacturer and provide such information as types of items available, number, educational level, prices, and addresses from which the materials may be ordered. Materials listed include flyers, brochures, booklets, films, filmstrips, kits, manuals, course guides, posters, and charts. (AW)

PREFACE

Aerospace education is not new. Each school year approximately 4,500 elementary school teachers use aerospace education materials as part of regularly planned science programs. More than 600 high schools across the country offer aviation courses for credit. The FAA Office of General Aviation Affairs lists over three hundred colleges and universities that offer degree programs in such fields as aerospace engineering, agricultural aviation, airport operation, aviation electronics, aviation management/administration, aviation mechanics and air traffic control.

The member companies of the General Aviation Manufacturers Association offer a variety of aerospace educational materials to complement aviation and science curriculums at all levels. These materials, available to teachers, instructors and administrators, may be ordered in limited quantities by writing directly to the manufacturers.

Educational Materials Available
from Beech Aircraft Corporation

Beech Aircraft supplies materials on four levels as follows:

1. Elementary--Aviation Education Kit depicting the history of Beech Aircraft Corporation with pictorial representation of aircraft now being produced by the Wichita, Salina, and Liberal facilities. This kit also contains information on fundamentals of flight, parts of an aircraft, an instrument panel and other educational information.

2. Secondary--a sample syllabus for high school aviation courses is supplied to school administrators, and school board members upon request. The type of high school course recommended by Beech Aircraft is an introductory, exploratory, careers-type program to acquaint the students with the overall impact of aviation upon the world today. Also available on the high school level is careers information as well as lithographs of Beech Aircraft's current models.

3. College level--a Beech Aircraft publication "Aviation/Aerospace Courses at Institutions of Higher Learning" is available to college administrators upon request. Free consulting service to those colleges wishing to consider the addition of or future development of aviation education programs is also available. These programs have been developed by numerous colleges throughout the nation ranging in scope from basic ground school through an entire B.S. Degree in Aviation Administration. Also, careers materials and lithographs are available upon request.

4. Vocational/Technical Institutes--limited number of shop manuals and surplus material is available to FAA/VA approved public vocational schools.

Additional materials such as films, filmstrips and slides, blueprints, charts, diagrams, and other historical information is available on all levels upon request. Many films are available from local dealers.

MARKETING DIVISION
COMMERCIAL AIRCRAFT

Cessna Aircraft Company has developed four levels of aviation education programs for schools described below and available from the following address:

Air Age Education Division
Cessna Aircraft Company
P. O. Box 1521
Wichita, Kansas 67201

ELEMENTARY:

1. (Free Flyer) informative brochure describing the Cessna Elementary Teacher's Kit. Also contains a sample lesson which the teacher may use in the classroom.

2. An especially designed kit of Air Age Education materials for elementary teachers contains dozens of items--posters--diagrams--booklets--charts--games--full-color pictures--demonstration model airplane--to everything needed to support a professionally developed unit guide on general aviation for social studies and science. In addition, the Kit provides a free subscription to a teacher newsletter of ideas and sources and a special free-loan film list keyed to the materials in the Kit. Education price only--$4.95 per Kit.

HIGH SCHOOL:

1. A special booklet A Need--An Answer is offered free to teachers and administrators interested in planning an introductory course in aviation for the high school level. Booklet describes Cessna materials and services offered to high school teachers including resources and a step-by-step procedure on how to establish a program based on the experiences of over 500 high schools.

2. An Introductory Aviation Course Guide contains a detailed teaching outline for the teacher including extensive resources especially designed for a high school course. Many free and low-cost materials are referenced for both ground school subjects and general information about the industry.

PAVE:

1. Programmed Assistance to Vocational Education (PAVE) is an especially designed program for vocational and technical training programs in aviation offering training materials and service information on a free-loan basis or at special school prices. Information on enrolling in PAVE is available upon request.

COLLEGE:

1. Cessna makes available selected materials and consultation tailored to meet the needs of the individual college including examples of successful college courses and company resources.

GENERAL:

1. Cessna provides a special free packet on learning to fly and Cessna products by writing directly to:

   Cessna Aircraft Company
   Department 783
   P. O. Box 1521
   Wichita, Kansas 67201

2. Free-loan films are available for all age groups on the fun of flying and the use of general aviation aircraft. Send film requests to:

PIPER EDUCATIONAL SERVICES

AVIATION CURRICULUM PLANNING

The Air Science Education Department working in cooperation with the Piper dealer organization will assist educational institutions in planning and implementing aviation programs at all levels. Every effort is made to guide program development according to accepted educational procedures as established by accrediting agencies, state departments of public instruction and other governing bodies.

AVIATION EDUCATION KIT

This special packet of information is designed to acquaint teachers and educators with the Piper Corporation, products and services. Aviation education articles, case histories, sample curriculums, guidelines for flight experience programs and other instructional materials are included. (ASE KIT 995-587)

PIPER AVIATION FILMS

Piper offers a selection of 16 mm color sound films for interest-boosting audio visual presentations. Topics include unusual and routine applications of general aviation aircraft and the flight instruction process in a number of geographic settings.

INSTRUCTIONAL WALL CHARTS

A series of instructional wall charts is available for classroom use, including a cut-a-way view of the Piper Cherokee Six, a flow chart of the Vero Beach manufacturing facility, and the Cherokee Arrow instrument panel. (ASE KIT 995-657)

SERVICE PUBLICATIONS FOR TECHNICAL SCHOOLS

A special package of selected service manuals and other maintenance data is available to schools offering bonafide airframe and powerplant mechanics training or aeronautical engineering. The purpose of these materials is to acquaint students with maintenance procedures on modern general aviation aircraft and engines. (ASE KIT 760-344)

PIPER EMPLOYMENT NEWS SERVICE

This service is available to technical schools and colleges offering vocational and degree programs in aviation. The program is designed to assist aviation schools in the placement of graduates and to attract more qualified applicants to the general aviation industry. A bi-monthly listing of employment opportunities within the Piper organization is distributed to placement bureaus and aviation directors at institutions subscribing to the service.

PIPER EDUCATIONAL SERVICES - (continued)

PLANT TOURS

Educators and school groups are welcome to take advantage of the daily guided tours conducted Monday through Friday at the Piper manufacturing facilities in Lock Haven, Pennsylvania and Vero Beach, Florida. In some instances special interest groups may desire presentations on a specific phase of aircraft manufacturing such as engineering or briefings on the general aviation industry.

EDUCATIONAL MAILING LIST

High schools, colleges and technical schools offering continuing programs in aviation may request placement on the Piper educational mailing list to receive periodic information related to aviation education, Piper products, and educational services. Schools requesting this service are asked to complete an information form to insure placement on the proper mailing list.

PIPER DEALER AND FLITE CENTER SERVICES

The most valuable and effective sources of assistance to educational institutions are the services available from over 600 Piper dealers and Flite Centers in the United States and 100 foreign countries. Arrangements can be made for orientation flights, field trips to general aviation facilities, career day presentations, and other programs to acquaint students and teachers with general aviation services. Apprentice mechanic training, work-study and other co-operative programs have been established in many localities.

FOREWORD

The Alaska State Division of Vocational Education Fire Service Training Program, in cooperation with the Alaska State Firefighters Association, has produced this manual for volunteer and paid firemen alike whose work compels them to meet the practical problems of fire suppression on a day-to-day basis.

Basic Firefighting Practices is a manual designed to teach new firefighters those fundamental practices and techniques needed as a basis for effective fire scene operations.

It is also designed as a simplified guide for departments needing a review of basic skills and as a source of information for those intending to teach the subject in Alaska.

No effort has been made to involve the highly technical aspects of the science of firefighting. Emphasis has been placed on the production of a manual which will be of value to fire departments throughout the State, regardless of size and level of proficiency.

Sincere appreciation is extended to the State Fire Marshal's Office, Department of Public Safety; to Mr. Lyle Goodrich, Supervisor of Fire Service Training for the State of Washington and his staff; and to the many members of the fire service all over Alaska who have provided information, made suggestions, and offered the constructive criticism necessary to the successful completion of this project.

Louis D. Ridle, Director
Vocational Education

William A. Hagevig, Supervisor
Fire Service Training

2498

FIRE DEPARTMENT SAFETY

Safety is defined as "the state or condition of freedom from danger or risk."

There are many unsafe acts being performed by firemen in their course of operations; some of these are necessary during the performance of their operations at the fire scene; some are foolish acts that cause accidents not only to the person performing these acts but can also endanger others.

Therefore, fire department safety must be given top priority if needless accidents are to be prevented.

Accidents At The Station: Accidents that happen at the fire station are needless; however, these accidents lead the other groups and can be attributed to these causes:

1. Horse Play
2. Lifting
3. Slipping
4. Improper use of power tools
5. Failure to wear proper protective clothing and accessories when drilling or working around the station
6. Poor physical condition
7. Lack of training
8. Inadequate lighting
9. Defective equipment

Accidents Enroute To And Returning From Fire: Accidents going to and returning from fires are next in number to accidents that occur in fire stations. These accidents also can be avoided. Caution should be practiced. The axiom, "Haste makes waste," is just as true here as any place. Some of the common causes of accidents going to and returning from fires are:

1. Careless or fast push out of fire apparatus
2. Failure to maintain complete control of apparatus
3. Excessive speed
4. Failure to proceed cautiously
5. Failure of fire personnel to be alert to their own safety and safety of others
6. Failure to secure safety belts
7. Putting on clothing and equipment on the way to the fire
8. Mounting or alighting from apparatus
9. Arbitrary acceptance of right way
10. Failure of personnel to secure themselves properly to apparatus
11. Failure to halt traffic or properly guide apparatus when backing into quarters

Accidents Occurring At The Scene: Accidents that occur at the fire scene occur less than those at the station; however, these accidents are usually more severe to the person who is hurt. Some of these accidents cannot be avoided; but, with due care and caution some can be avoided. Foolhardiness at the fire scene is not good firemanship but carelessness and should be discouraged by the fire officers of the department.

Some of the leading causes for accidents at the fire scene are:

1. Taking hydrants too fast
2. Dropping couplings on toes
3. Straddling hose ahead of hose clamp or straddling of charged lines
4. Too much pressure on lines
5. Hydrant man turning on hydrant before the hose clamp is in place
6. Moving charged line without shutting off the nozzle

2498

7. Charging of the line while firemen are taking hose up ladders or stairways

8. Taking charged lines up ladders

9. Kicking hose clamps open

10. Laying hose too fast

11. Improperly secured ladders

12. Improper climbing angle

13. Raising ladders into overhead obstructions

14. Incorrect lifting

15. Lack of protective clothing (coat, helmet, gloves, etc.)

16. Improper use of tools (axes, pike poles, etc.)

17. Not using respiratory equipment

18. Lack of hand lights or flashlights

19. Improperly secured tools and equipment when being raised to upper floors

20. Trying to hurry

21. Poor physical condition

WORK WITHOUT STRAINING

Your muscles, that is. Whether you have a pulled muscle, sprain, Charley horse or a backache chances are you could have prevented it. Anybody who has ever suffered a sprained ankle knows how much pain can come from a ligament stretched too far. Anybody who has suffered from a Charley horse knows the pain of a muscle spasm. Anybody who has cracked his funny bone knows how pain radiates along a squeezed nerve.

Most common source of muscular aches and pains are poor lifting methods. In fact one work injury out of four results from poor handling of materials. Just consider that when you straighten up from a bent over position with a weight, the strain on the muscles, vertebrae, ligaments and discs in your back is 15 times or more the weight of the object.

Follow these four simple rules and you'll find yourself working and playing without strain:

1. Use your strong leg and arm muscles when you lift--not your back. Your back has enough to do just supporting you and allowing you to bend.

2. Gear your activity to your age and physical condition. Physical effort in moderation is an excellent body builder but don't carry it to excess. Stop and rest when you feel the danger signals of fatigue.

3. Build up your muscles--but in easy stages. And don't just concentrate on your biceps; get as many of your muscles as you can into the act.

4. Change your working position as often as you can. If your job is a sedentary and stationary one, watch your posture. Periodically rest the set of muscles in constant use; don't let yourself get tense.

SAFE LIFTING METHODS

Do the following:

1. Inspect load to make sure you can handle it yourself and decide the best way to grasp it.

2. Get a firm footing close to the object to be lifted; feet the length of a shoe apart for balance.

3. Bend knees and crouch down to the object.

4. Keep the back almost vertical and feet apart.

5. Get a good grip.

6. Straighten the knees slowly; rise, keeping load close to the body and directly over feet.

7. Lower load just as you lifted it.

8. Lift the load waist high and rest it on a support to get a better grip before raising it to shoulder height. Bend the knees to give added power for the final lift.

9. Rest frequently when carrying load for a long time. A tired person is more subject to strain, tripping and loss of balance.

10. Stop, reduce the load by making more trips or get help when you feel strain or pull.

11. Grasp sacked material by diagonal corners and swing to one shoulder with a boost from the knee.

12. Take care of muscular aches and pains immediately.

ELECTRICAL HAZARDS

The following statements among others are often offered as explanations by firemen who find themselves in trouble with electrically charged wires. When dealing with electrical power the fireman may never get a chance to tell how the accident happened. It merely happened and the roster of the department is short one man. In view of the dangers, even for experts, in handling electrical equipment and since firemen may be called upon to deal with charged wires at any time, every efficient fireman should be thoroughly familiar with what he may do safely. He should know also that whatever he does must be done with the utmost caution at all times.

When an accident occurs, the victim and often those responsible for it are likely to excuse themselves with statements which are far from convincing. Among the most common explanations are the following:

"But it was the first time.
"Sure, I knew better.
"It slipped and I went over.
"I didn't know the wire was hot.
"I knew it wasn't the right method, but--.
"We have done it that way for many years.
"It was only a low-voltage wire.
"He hadn't been trained.
"The pole was almost long enough.
"I was thinking of something else.
"I thought it was only a telephone wire.
"I didn't know that.
"Why didn't someone tell us--?"

Always assume that all wires and equipment are alive and dangerous and that they may cause serious bodily harm.

Be careful to avoid bodily contact with wires. Do not attempt to handle wires unless properly equipped and trained.

BEHAVIOR OF FIRE

During post-fire discussions we have often heard these remarks made, and we quote, "That sure was a stubborn fire to extinguish" or to the contrary, "We sure knocked that one out quickly." Yet, too often, we fail to hear any remarks relative to why the fire may have been classed as being stubborn or one that was easily extinguished.

In order to clarify such situations, we must have a basic understanding of how a fire starts and the way it travels from its place of origin to adjacent areas. The so-called art of extinguishment and the rapidity with which we can accomplish that particular phase of fire control cannot be exercised properly without first having a basic knowledge of fire itself.

The techniques employed in fire control are based on teachings of firemanship and in one way or another are tied directly to the behavior of fire. Your welfare and the safety of others will be determined by your knowledge of the many complex situations arising from a fire control problem. One of the most important factors to be considered is the behavior of fire itself.

The general concept of fire is based around the familiar triangle where oxygen, fuel and heat are the necessary essentials required to support combustion. With a good understanding of these basic needs we can go into greater detail relative to fuel, its characteristics and many other factors that contribute to fire behavior. Other than the basic factors involved around the triangle of fire, most discussions could be considered as being under the heading of sub-divisions of fire.

Fire is usually caused from the hazards created by people. The title of this subject seems to indicate to the layman or the average worker that we are simply going to discuss how and where a fire might start in a particular place, what to look for or the dangers involved if fire does start.

Basically, these very topics will be covered; but fundamentally, the purpose is to explain how and why fire starts and its reaction once it has started so that you might recognize better those things in your own departments which might cause a fire and so that you will be able to correct unnecessary hazards and learn how to cope with those that are necessary. To function efficiently, a fire brigade must know something of the causes of fire and the conditions under which fire may be expected.

The study of what causes fire is known as the chemistry of fire. Once one learns the causes of fire, the prevention of it is much easier. For that

COGS 2502

reason I will attempt to point out some of the simpler aspects of what happens and how it happens when fire occurs.

Surely we are all familiar with the fire triangle. We realize that in order to have fire, three things must be present, oxygen, heat and fuel. Take away any one of the three and the fire goes out. That, on the whole, is the secret of the suppression or extinguishment of fire. All fires, large or small, are eventually put out in this manner.

Yes, we are all familiar with the triangle of fire andhow it works. We know these things concerning the triangle to be true but do we know why. For instance, use fuel as an example. When one thinks of fuel, he thinks of a combustible material or a material made up of the elements that will ignite when united with oxygen and heat in temperature and quantity.

The combination of a fuel or a substance with oxygen is called oxidation and is continually taking place in all matter. It may occur slowly, such as rust or iron, the rotting of wood or a sliced apple turning brown; or rapidly, and even instantaneously, as in an explosion. As oxidation occurs, heat is given off and when the temperature and quantity of heat become high enough, fire occurs. Fire is a rapidly occurring chemical reaction in which the element, oxygen, combines with other available elements to produce light in the form of visible flame and heat in the forms of high temperatures.

Since fire is a rapid chemical combination between a fuel and oxygen, let's first take up the effect that oxygen has on fire in the fire triangle. It is the oxygen in the air that causes oxidation of all substances which causes combustion. The air we breathe contains about 21% oxygen and 78% nitrogen and a small percentage of other gases. However, it is only the oxygen in the air that is important to fire.

To demonstrate this importance of oxygen to fire one may use a lighted candle and a water glass. As you place the glass over the burning candle, shutting off the outside air, the flame grows smaller and finally goes out. The flame is extinguished because it has used up all of the oxygen within the glass. When oxygen content drops below 15%, combustion ceases. Thus, if we takeaway or eliminate oxygen or one leg of the triangle, fire ceases to exist. The amount of oxygen available is a factor in the length of time the fire will burn. By the same token, if you increase the percentage of oxygen, the fire will burn more violently. For example, an acetylene torch using acetylene gas for fuel and 100% oxygen produces an intense flame.

Certain materials such as plastics, gunpowder, rayon, etc., contain oxygen and burn violently. In other words, when materials such as these become ignited, they give off oxygen which intensifies the flame. Still others may appear as fire safe because they are not a fuel in themselves; but when heated, they give off oxygen and cause surrounding fuels to burn with fury. Naturally, these items should be stored away from combustibles. They will be marked by a yellow I.C.C. tag by the manufacturer. These materials are such things as nitrates, chlorates and peroxides which are used to manufacture items such as fertilizers, dyes and bleaching compounds. Yes, oxygen is necessary for fire to exist the same as it is necessary for life to exist. Take oxygen away from either and it is impossible for them to survive.

2503

Fire's second leg of the triangle is fuel. Without something to burn, there can be no fire. Fuel exists in one of three forms--as a solid, as a liquid or as a gas. Most material can exist in more than one state. Water, which is normally a liquid, becomes a solid, ice, when frozen; or gives off a vapor or gas in the form of steam when heated.

Inasmuch as oxygen is a gas, the fuel must also be in a gaseous state in order for combustion to occur. Conversion of a solid or liquid to a gas can be accomplished by heating the material. This may be explained by again using a lighted candle for an example. By extinguishing the flame and quickly holding a lighted match to the rising vapors, the flame will follow downward until the candle again burns. Burning vapor can be seen by looking closely at a candle flame. Notice the space between the wick and the flame. This is because the heated fuel vapor spreads outward and upward until contact is made with the oxygen in the air and then combustion occurs. This also illustrates the fact that when gases are heated, they expand and therefore rise.

It is important to know that only the vapor burns, not the fuel. In order to burn readily, the vapors must be able to combine with oxygen. The principle fuel elements are hydrogen, carbon and a little sulphur. There are more compounds of carbon than any other element. If the mixture of the vapors and oxygen is unbalanced (as it might be) and conditions are such where there is heat enough to produce a carbon vapor, but not enough oxygen to support combustion, a deadly gas is given off in the form of carbon monoxide. This is nothing more than a product of incomplete combustion. And if these gases are confined, a dangerous condition can develop. For with an admittance of additional air from some external source, a very rapid combustion or explosion occurs. This condition is known to firemen as a backdraft.

The size of the fuel particles also plays an important part in fire behavior. For an example, if one takes a block of wood and holds a match under it, does it catch fire? No. Why? Because the heat from the match is so small that it is dissipated before the large block can provide enough vapor to support combustion. In other words, there is such a small area of the large block exposed to the match, it will not produce vapors enough to support combustion. But if one takes his knife and makes kindling of this block, the match will then readily ignite this fuel. The obvious reason is that there is a much larger area exposed to the heat; therefore, it ignites immediately. The relation of fuel size to burning violence is the reason dust explosions occur. Minute particles of fuel, entirely contacted with oxygen, produce instant combustion when brought in contact with an ignition source.

Another factor that enters into the fire picture so far as fuel is concerned is the area involved. The area of the fuel determines the size of the fire. For an example, use a small can of gas. If you light it, the size of the flame is limited to the size of the can; but if you pour the gas into a larger pan, the area of the fire is much greater. Consequently, the fuel will be consumed much faster. Therefore, the length of time the fuel will burn is determined by the rate at which the vapors can contact oxygen.

The arrangement of the fuel also determines the speed at which it will burn. If you take a match and strike it and hold it with the flame at the top, burning will be slow because the heat rises away from the match. But if you

reverse this and hold the flame down, the fuel is preheated and readily vaporized and is consumed by fire immediately. Yes, fuel is necessary for fire to exist. Remove the fuel from fire and we have no fire.

The third and final leg of the triangle of fire is heat. Perhaps the first thing that should be made clear is the difference between temperature and heat. A degree of temperature is not a measure of volume or quantity. A welding torch flame has a temperature of 5000°; yet you could not heat the room with a welding torch. However, a radiator that can be touched with the bare hand will do an excellent job of heating the room. The reason is that the amount of heat in relationship to the area to be heated is different in each case. In the torch instance, the area to be heated was concentrated in a very small spot. In the radiator example, the heat was distributed over a very large area. Thus, it can be seen that there is a factor involved other than temperature.

Heat is measured by the British Thermal Unit, BTU. A BTU is the amount of heat necessary to raise one pound of water one degree in temperature. In order for burning to take place, there must be a point at which continuing, rapid combustion starts. This is called the ignition temperature. This ignition temperature varies because of certain circumstances such as the surface exposed, the length of time it is exposed to heat, the intensity of heat, etc. When a fuel reaches its ignition temperature, it will ignite. It is not necessary to have a spark or flame present.

Flammable liquids usually produce vapors. The lowest temperature at which a flammable liquid gives off sufficient vapor to support combustion is the flash point of that liquid. Gases do not have a flash point because they are in a vapor state.

Two other factors concerning heat are:

1. When most materials are heated, they expand.
2. When air is heated, it expands, loses weight and rises.

These facts are evident to most of us. Heat will normally flow from a warm object to a cold one. Cold is merely the absence of heat.

There are three ways that heat may be transmitted from its point of origin; by convection, by conduction and by radiation.

During convection heat is transmitted or transferred by a circulating medium. As we know, heat rises. So when fire occurs, the rapidly rising heated gases raise the temperature of a fuel, often far removed from and above the original fire, above its ignition temperature, resulting in a second fire.

Conduction is the physical flow of heat through a material. An example might be seen if one put a key in the flame of a candle. The heat of the candle has moved away from the high heat area to the cold key, causing it to become hot. Different materials have different conductivity so far as heat transmission is concerned.

2505

During radiation, heat is transferred from one body to another by heat rays through space, much the same as light is transferred by light rays. There is no physical movement of the heat itself. An example of how radiation causes fires might be when a wooden box sitting close to a burning stove ignites. Heat is radiated from the stove to the box and contents which heats them above their ignition point causing fire. Thus, heat also plays an important part in fire. Remove the heat from the triangle and there will be no fire.

There are many other ways heat can be produced than by an open flame. Heat can be produced by spontaneous ignition, which is a result of rapid oxidation. Furthermore, heat is produced by chemical reaction--a result of unslacked lime and water, by friction--a result of rubbing belts, etc., by electricity--a result of an overloaded or short circuit, by percussion--a result of explosives, and by compression--a result of compressed gas. All of these causes are self-explaining and time need not be taken at this time to delve into each.

So now we know what causes fire and how it develops. And when we have a better understanding of this, fire prevention becomes much easier.

Because we understand how fire reacts once it starts, we are better able to recognize the hazards that cause fires. Most of the fire hazards in a plant can be removed. They are usually the result of improper construction, poor housekeeping, improper storage of materials, poor installation of machinery, etc. These hazards can be eliminated. Others, such as electricity, inflammable liquids, dust scrap materials, etc. are what we call necessary hazards. We cannot remove them because they are a part of our production within the plant. But <u>we can control them</u> through proper installation, through proper storage and through proper care. They need not become fire hazards. Each and everyone of us know of several hazards in our department which might cause fire. Let's eliminate them and let's control the necessary hazards. Let's not give fire a place to start.

Fire, as we have been taught, is a result of many things; but chiefly, fire is a result of carelessness. To overlook or ignore something that might be a fire hazard or cause a fire in your department, is nothing more than carelessness. No, fires don't just happen, they are caused.

FIRST AID FIRE EXTINGUISHERS

INTRODUCTION

The operation of first aid fire extinguishers is of prime importance to firemen for several reasons. First, extinguishers in many public and industrial establishments may hold the fire in check in its incipient stages. Secondly, firemen, themselves, need to be familiar with the operation of extinguishers since they are very valuable in attacking special types of fires and in reducing water damage. Extinguishers are only as good as the operators using them.

Also, it has become the responsibility of the firemen to recommend to citizens of their communities the best type of fire extinguisher for their needs.

Do not expect to extinguish larger fires than those for which the equipment is designed.

Fire departments should always recommend approved types of extinguishers. Be sure that you recommend equipment approved by the National Board of Fire Underwriters.

CLASSES OF FIRES

So that firemen will recognize and use the type of extinguisher best suited for the type of fire being attacked they must know the classes of fires.

"A" Fires in combustible materials such as wood, paper and trash, material that usually leaves coals and requires removal of heat and quenching to extinguish.

"B" Fires in flammable liquids such as gasoline, oils, paints, fats, greases or other flammable liquids where a blanketing or smothering effect is essential.

"C" Fires that are involved with electrical equipment requiring the use of non-conducting extinguishing agents.

Fires in combustible metals such as magnesium, powdered aluminum, zinc, sodium or potassium make up a fourth specialized class. Ordinary extinguishing agents are ineffective on these metal fires which are best controlled by covering with special dry powder or granular materials which include oxygen and will not react or combine adversely with the metal.

EXTINGUISHERS USED FOR CLASS "A" FIRES

1. Pump can and back type pump can
2. Gas water
3. Pressured water
4. Foam (will not penetrate for extinguishment of deep seated fires)
5. Soda and acid

EXTINGUISHERS USED FOR CLASS "B" FIRES

1. Foam
2. Carbon Dioxide
3. Dry Powder

EXTINGUISHERS USED FOR CLASS "C" FIRES

1. Carbon Dioxide
2. Dry Powder

2508

PUMP CAN AND BACK TYPE PUMP CAN

The water pump can (See Figure 1) and back type pump can come in a number of different sizes ranging from 2½ to 5 gallons. The method of operation is to pump the water to the base of the fire by means of a hand pump which is of the double acting type.

These types of extinguishers have an operation time of 40 to 120 seconds duration depending upon the operator. The effective reach is from 30 to 40 feet.

This equipment can be maintained by anyone. Check the water level often, put a few drops of oil on the pump and check the packing around the pump shaft. Do not overtighten; a slight leakage of water around the shaft is desirable, only tighten the packing nut 1/8 turn at a time--hand pressure only--do not use a wrench. If it is necessary to use a wrench, the shaft needs replacing. A graphite string packing is the type to use. Overtightening makes the pump work hard and tires the operator rapidly. As the water pump can ages and anti-freeze is added from time to time, it may be necessary to remove the pump and clean all working parts including the pump shaft and cylinder and ball check valves. After using anti-freeze solution it is wise to clean the container thoroughly as these solutions are corrosive. To make the equipment last a long time and give good service when needed a little service is necessary.

The water pump can may be filled while in use from any source of water supply and may be used any place where a Class "A" extinguisher is required.

Figure 1

2509 0165

GAS CARTRIDGE, WATER FILLED

This is an extinguisher (See Figure 2) which uses a cartridge having an inert gas, usually carbon dioxide, which furnishes the pressure to expel the water contained in the tank. It is put into operation by turning upside down and bouncing on the floor, forcing the cartridge to be punctured and causing the gas to enter the container and forcing the water from the extinguisher. Use only cartridge specified by manufacturer.

This type of extinguisher has many advantages. It can be kept sealed and thus the water will remain clean. It can be used in areas where it is subjected to freezing as it can be filled with a calcium chloride solution. It is finding wide acceptance in areas that were formerly covered by soda and acid type extinguishers.

PRESSURED WATER

The pressured water type extinguisher is very similar to the gas cartridge type except that air pressure is used to force out the water from the extinguisher.

Figure 2

2510

FOAM

This extinguisher (See Figure 3) is used both on Class "A" and Class "B" fires; however, its best use is for Class "B" fires involving flammable liquids. The outer chamber contains sodium bicarbonate and a foam stabilizer, while the inner chamber contains aluminum sulphate. This extinguisher operates on a chemical reaction theory similar to the soda and acid extinguisher. When the extinguisher is inverted, the aluminum sulphate dissolved in water in the removable chamber is allowed to mix with the foam stabilizer in the outer chamber. With the contact of the two materials an extinguishing agent is formed known as foam. No other chemical should be added to a foam extinguisher as it will nullify the action of the extinguisher.

The application of this foam upon the flammable liquid fire causes a blanket of foam to cover the fire excluding the oxygen and smothering the fire. A cooling effect is also present due to the high moisture content of the foam. The foam extinguisher will deliver approximately 25 gallons of foam for a 2½ gallon type.

Figure 3

SODA AND ACID

The soda and acid extinguisher (See Figure 4) is perhaps the best known of the many types of extinguishers. It has been used in the fire service for many years and has widespread use on fire apparatus as the expelling agent for booster tank operation; hence, the name of "chemical tank" came into being.

This extinguisher ranges in size from 2½ gallon to 33 gallon capacity. The common 2½ gallon consists of either a brass or stainless steel canister made to withstand the pressure stamped on the label. The 2½-gallon extinguisher contains 2½ gallons of water mixed with bicarbonate of soda and a bottle containing four ounces of sulphuric acid held in a cage at the top of the extinguisher. This bottle has a loose fitting, lead or porcelain stopple which remains in place as long as the extinguisher is in an upright position. To put it in operation the extinguisher is carried to the fire in an upright position. The extinguisher is then inverted with the operator holding the nozzle in one hand and grasping the handle in the bottom with the other. He then plays the stream at the base of the flames.

The soda mixing with the acid forms a CO_2 gas which is the propellant.

The advantage of this extinguisher is the ease and cheapness of maintenance. The pressure generated with a Free Discharge is 60 to 80 pounds which will throw the stream from 30 to 40 feet. However, the discharge time is short, approximately one minute.

The extinguisher should be checked annually and each time it is used for plugged hose or nozzles and leaks. CAUTION, never try to repair a leak in the tank of this extinguisher. Should water fail to be expelled immediately, discard in a safe place as discharge hole could be plugged and extinguisher could rupture violently causing injury.

2512

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

CARBON DIOXIDE

The carbon dioxide fire extinguisher (See Figures 5a and 5b) is used primarily on Class "B" and Class "C" fires. It is a nonconductor and therefore very suitable for Class "C" fires. The extinguisher is of a sturdily built pressure container in which carbon dioxide is kept in its liquid state under normal room temperature. At 70° F. the internal pressure is approximately 850 P.S.I.

To expel this type of extinguisher a valve or squeeze type release is used and a horn or a hose and a horn are used for applying the carbon dioxide on the fire.

Due to the expansion of the liquid carbon dioxide upon its release at the point of the horn, approximately thirty percent of the CO_2 is converted to "snow" or solidified dry ice. The temperature of this "snow" is approximately -110° F. The gas that is released is heavier than air and when applied will form a blanket over the fire and thus smother the fire. However, caution should be maintained to see that a flashback does not occur. There is little cooling effect and materials that tend to contain heat may cause a flashback where fires are found in flammable liquids of a low flash point rating. A CO_2 extinguisher has an effective range of 2 to 4 feet.

Caution should be used in applying CO_2 in confined areas. It is not toxic, however, it will replace the oxygen in the area. Care should be taken to see that in confined areas oxygen is furnished by ventilation. It is necessary for firemen to use self-contained masks to enter the area.

Figure 5a

Figure 5b

2513

SIZE OF CO_2 EXTINGUISHER CONSIDERED ADEQUATE TO USE ON OPEN TANKS OF FLAMMABLE LIQUIDS

EXTINGUISHER SIZE, IN LBS.	GASOLINE & SIMILAR LIQUIDS, SQ. FT.	KEROSENE & SIMILAR LIQUIDS, SQ. FT.	ALCOHOL & SIMILAR LIQUIDS
2 to 3-3/4	1	1	3
4 to 6-1/2	2	3	5
7 to 9-1/2	3	4	8
10 to 14	3	4	8
15 to 29	5	7	13

For tanks inside buildings, because of the difficult approach caused by smoke and heat, portable extinguishers alone should not be relied upon.

DRY POWDER

The dry powder type fire extinguisher (See Figure 6) is used primarily on Class "B" and "C" fires; however, its main use is for flammable liquid fires where its reach and smothering effect is at its best. This type of extinguisher is usually found in the 2½ to 30 pound sizes. The extinguishing principle of this type extinguisher is essentially that of a smothering action. This action results from the fact that the small particles of soda absorb heat and then break down and release carbon dioxide gas and the small particles of soda tend to displace the oxygen around the fire.

The dry compound fire extinguisher consists essentially of a metal shell filled with a specially treated bicarbonate of soda. This soda is treated to prevent its caking and absorbing moisture and to insure a uniform particle size. The dry powder is expelled from the cylinder by the action of a carbon dioxide cartridge, a nitrogen cartridge or air pressure. The extinguisher must be recharged after use. A 10 to 30 pound dry powder extinguisher has an effective range of 6 to 12 feet.

The dry compound type extinguisher has recently been perfected to a point where it has proven very effective in the extinguishment of flammable liquid fires. Some manufacturers have perfected a special type of powder extinguisher that is an adaption of the dry powder extinguisher for use on aluminum and magnesium fires.

Figure 6

Dry powder extinguishers that are carried on fire apparatus should be inverted once a week to break up any caking that might occur due to the jarring to and from a fire. If the extinguisher is not used within a three-month period, the powder should be removed, aerated and put back in the extinguisher. The hose and nozzle should be checked for plugging.

SIZE OF DRY POWDER EXTINGUISHER CONSIDERED ADEQUATE FOR USE ON OPEN TANKS OF FLAMMABLE LIQUIDS

EXTINGUISHER SIZE, IN LBS.	GASOLINE & SIMILAR LIQUIDS, SQ. FT.	KEROSENE & SIMILAR LIQUIDS, SQ. FT.	ALCOHOL & SIMILAR LIQUIDS, SQ. FT.
4 to 6-1/2	3	4	8
7 to 9-1/2	5	7	13
10 to 14	7	9	18
15 to 19	9	12	23
20 to 24	12	16	30
25 to 29	14	18	35
30 to 34	17	22	35

For tanks inside of buildings, because of the difficulty in approach caused by smoke and heat, portable extinguishers alone should not be relied upon.

HYDROSTATIC TEST

All soda and acid, foam, gas cartridge water filled and pressure water extinguishers should be hydrostated to a pressure equal to but not exceeding the pressure marked on the name plate. Pressure to be held for one minute. The test should include the hose. For safety it is recommended the test be conducted every three years. Hydrostatic test procedure can be found in N.B.F.U. Pamphlet #10.

GARDEN OR JIFFY HOSE

The Class "A" type of fire needs an extinguishing agent which will penetrate and cool the burning material. Of these agents water is the most plentiful and best known.

The garden hose with nozzle and adapter for home use is one of the easiest to handle and needs the least maintenance. You will have a continuous supply of water and by using the shutoff nozzle you are able to control the water damage. With good water pressure the nozzle on spray position can give an effective fog pattern. The reach of the average nozzle in directing a stream of water at a fire is from 25 to 40 feet depending on the water pressure.

2516

When recommending the use of garden hoses to others, be sure that you specify that they place coil in a place where it is readily available. It should be not less than 50 feet in length.

VAPORIZING LIQUID EXTINGUISHERS

The state fire service discourages the use of this type of extinguisher due to the toxicidity.

2517

CHARACTERISTICS OF APPROVED FIRE EXTINGUISHERS AND RECOMMENDED APPLICATION

	Carbon Dioxide	Dry Chemical	Foam	Pump Tank	Soda-Acid	Gas Cartridge Water-filled
Class "A" fires Wood, rubbish, paper, textiles	No But will control small fires	No But will control surface fires in textile fibers	No But will control small fires	Yes	Yes	Yes

Carbon Dioxide	6 or less lbs. of CO_2	B-2, C-2	1-B, C
	7-1/2 lbs. CO_2	B-2, C-1	2-B, C
	10-12 lbs. CO_2	B-2, C-1	4-B, C
	15-20 lbs. CO_2	B-1, C-1	4-B, C
	25 & 26 lbs. CO_2	B-1, C-1	6-B, C
	50 lbs. CO2	B-1, C-1	10-B, C
	75 lbs. CO_2	B-1, C-1	12-B, C
	100 lbs. CO_2	B, C	12-B, C

NOTE: Carbon dioxide extinguishers with metallic horns will not carry any Class "C" classification.

Dry Chemical	4 to 6-1/4 lbs.	B-2, C-2	4-B, C
	7-1/2 lbs.	B-2, C-1	6-B, C
	10 to 15 lbs.	B-1, C-1	8-B, C
	20 lbs.	B-1, C-1	16-B, C
	30 lbs.	B-1, C-1	20-B,CC
	75 to 350 lbs.	B, C	40-B, C

*NOTE: Portable fire extinguishers with fractional ratings are not considered as meeting the requirements of this section.

BE AN EFFECTIVE NOZZLEMAN

The most important firefighter on the fire scene is the nozzleman. This does not mean that the officers, laddermen and pump operators are not important because they are. Usually however every effort is given just to get the nozzlemen into action on the fire. We know that all other operations are just back-up for the nozzleman for if we didn't supply him with water through the pump the fire would not be extinguished. However in spite of all the good equipment, water system and leadership it is still the actions of the nozzleman in applying water to the fire that will determine how effective the tactics used will be.

It is important therefore that the firefighter has knowledge and skill if he is to be an effective nozzleman. This knowledge and skill can only be achieved through training and actual experience. His experience will however be limited to the number of fires that he works on, therefore training becomes the primary method to teach him the knowledge and skill that he will need if he is to become an EFFECTIVE NOZZLEMAN.

The nozzleman must have an understanding of fire behavior if he is to know the most effective methods for applying water to a fire situation. Besides this knowledge of fire behavior he must also have a knowledge and skill with the tools that he will use with the nozzle.

TYPES OF NOZZLES

As a nozzleman you should understand the many types of nozzles and how they operate. It is just as important to know what the nozzle can deliver and its effective reach, whether it is a solid stream type nozzle or an adjustable type nozzle. There are many variations of the adjustable type nozzle with many different ways of breaking up the water into small droplets of water.

The two basic types however are the nozzle that delivers water in a solid stream and the adjustable type nozzle that has the ability to be changed from a straight stream pattern to a wide fog type pattern.

SELECTING THE RIGHT TYPE NOZZLE

If you desire to apply water in a solid mass with enough kinetic energy to carry it through a strong thermal column and to also reach into a building, then you would select a nozzle capable of a solid stream.

A good solid stream nozzle will be capable of producing the following:

a. A stream that at the limit named has not lost continuity of stream by breaking into showers of spray.

2520

b. A stream that up to the limit named appeared to shoot nine-tenths of the whole volume of water inside a circle 15 inches in diameter and three quarters of it inside a 10 inch circle, as nearly as can be judged by the eye.

c. A stream that would probably be stiff enough to attain in fair condition the height of the distance named, even though a fresh breeze is blowing.

d. A stream that at the limit named, with no wind, would enter a room through a window opening and strike the ceiling with force enough to spatter well.

THE ADJUSTABLE TYPE NOZZLE

The nozzleman of today has more experience with the adjustable type nozzle than with the solid stream nozzle. This is because with its versatility the adjustable nozzle delivers patterns ranging from a wide angle stream with low velocity to a straight stream with high velocity.

As a nozzleman it is important that you know the mechanics of its operation. The newer type adjustable nozzles give constant flow at all positions. However, it is important that the department check the gallonage for each nozzle to determine that they are capable of the flow desired. The adjustable nozzle operates at about 100 pounds of nozzle pressure regardless of the pattern used. Most new nozzles have marks or notches which serve as a guide to indicate the degree or pattern of the stream. These marks are helpful, but when you are fighting a fire the important thing is not the mark you are on, but whether the fog pattern you are using is correct for the job.

THE NOZZLEMAN SHOULD UNDERSTAND FIRE BEHAVIOR

From your ventilation classes you know that fire usually goes through several stages from its beginning to total involvement. Most fires start with a small flame which may continue until complete involvement takes place.

FLASHOVER

As the fire continues to build up we have a condition called a "flashover" this occurs when all the light materials have reached their ignition point and have ignited. These materials are usually curtains, wallpaper, lamp shades and other easily ignited materials. After the flashover the fire starts to involve the heavier materials and assumes what is known as a "Steady state". That is, the fire has flashed over and has usually vented itself and is now burning quite rapidly. There will be an equal amount of oxygen entering the

0525 2621

building with heat, gases and smoke being ejected from the building. This steady state will only continue as long as there is this one to one ratio of air entering and smoke, gases and heat leaving. Most firefighters recognize a fire as being in the steady state by referring to it as being in the red. This type of fire will continue until it has burned into the walls and ceilings, thus exposing the structure itself to the fire. When fires reach this state the temperatures will usually run upwards to 1400 degrees. If the fire continues until it has burned through the roof and vented itself this temperature will then drop to about 900 degrees.

Regardless of the condition of the fire the nozzleman should protect himself from the heat. This can be accomplished by adjusting the nozzle to a wide spray pattern and advancing to the point of attack.

THE THREE METHODS OF ATTACK

The nozzleman should know the three methods of attack: Direct, indirect and combination attacks. He should know from the fire situation which method will be most effective.

Using the direct attack method

There are a number of situations that are best handled with the use of either a straight or solid stream attack. If the fire is small and the heat accumulation is low, you will more than likely make a direct attack at the seat of the fire. See figure #1. If the building has already vented itself and you desire reach to get into the fire area, then either the straight stream or the solid stream will be effective. There is one other instance where either the straight or the solid stream is effective and that is when you need either a mass of water or water with enough velocity to carry through the thermal column.

The direct attack water is applied using a straight or solid stream directly at the seat of the fire.

Figure I

2522

Using the indirect attack method.

An effective method of attack is by using the indirect method where you apply water only to the heated overhead in the involved area. The indirect attack method continues steam production over a longer period of time than either of the other methods.

To apply water by use of the indirect method direct the water into the heated overhead, moving the stream back and forth and changing the pattern as you cover the heated area. This method might be compared to that of painting a ceiling with the water nozzle. An important item to remember in using this method is to reach as far back into the building as possible varying the pattern and then work towards yourself. Figure #2 shows the correct method of applying the indirect attack.

The indirect attack water is applied into the heated overhead.

Figure 2

Do not confuse the indirect results with the indirect method. Fire may follow various channels in spreading from one room to another area. The steam generated by either method of attack may follow these channels and control the fire. This is known as an indirect result.

Combination method of attack.

The combination attack is a combination of the direct and indirect attack methods. This attack method has formerly been called the indirect method of attack. It requires that the nozzleman apply water into a heated area and revolve the nozzle in a clockwise method applying water into the heated overhead and also on the burning material. This method will create steam as well as cooling the burning material.

The combination attack is most effective in fires involving one or two rooms. If the attack is made from the outside towards the interior, care must be taken that the application is fast enough and with a large

8829523

enough volume of water to quickly control the fire and to prevent the spread of the fire by underapplication. Figure 3 illustrates the correct method of making this type of attack.

The combination attack water is applied into all parts of the fire area by varying the pattern and revolving the nozzle in a clockwise motion.

Figure #3

THE NOZZLEMAN NEEDS TO KNOW ABOUT THERMAL BALANCE.

As a nozzleman you will need to know something about thermal balance. What it is and how it can help you. Thermal inbalance will not occur too often but when it does occur you can be sure that the water being applied is not reaching the fire.

Thermal balance then is when an equal amount of air enters the building with an equal amount of gases, heat and smoke being vented out of the building. See Figure #4.

This room is in thermal balance. Air moves in at the bottom while products of combustion move out at the top in a one to one ratio.

Figure #4

2524

This thermal balance can be upset by the application of water into the fire area. See Figure #5. What you will see is a cutting off of visibility when the gases, smoke and steam swirl past the opening where water is being applied.

Figure 5

Improper application - use of wide fog at opening. Upsets thermal balance.

Figure 6

Effect of improper application--a mixture of smoke and steam rolls downward and toward fire. Doesn't actually rea fire which is burning at back of room.

See Figure #6. What caused this change to take place? The hot air gases and smoke are lighter than the cold air. If the products are left undisturbed the products of combustion will be evenly distributed at the top and the cooler air will be at the bottom. Then when you hit this atmosphere these products of combustion cool and cause a circulation of fire gases and steam which revolves from the top to the bottom of the area. This is caused because the application did not reach the fire area and it continued to burn, pulling additional amounts of air as was needed to keep it burning. If the nozzleman will note the direction the swirl is taking, and point the nozzle in a straight or solid stream pattern towards the area that the swirl is pointing to, he can apply water into that area causing the problem and restore thermal balance. See Figure #7.

Thermal balance - cloud is smoke. Oxygen is flowing toward fire from below.

Figure 7

2525

Thermal balance will not be upset in most fire situations if the proper nozzle pattern is used along with the right size nozzle. If you cool the room evenly, the resulting air currents will ventilate the area.

What is the result of over-applying?

Do not over apply the water. If you do you will cool the area down too much and kill the steam blanket. The time to shut down is when the fire has been blacked out. This will take from ten to thirty seconds of application dependent upon the gpm nozzle used. Move in as soon as possible to prevent the fire from building back up. You will have about four to five minutes before the heat will build up enough to restart the fire.

WHEN SHOULD YOU MOVE IN ON A FIRE?

If the officer determines that the building is safe it is important that you move into the building at once. If you can stand the heat on your face while standing then you should be able to move in by staying close to the floor where there will be less heat and smoke. You should use short bursts of water in a straight stream pattern on those small fires that you see. Using wider patterns might tend to create steam in the area you will be working, thus making the area uncomfortable for working. Care must also be taken not to block the doorway when entering in order to allow all the fresh air possible to enter the fire area.

Many times you can leave a small flame, that is not hurting anything and that cannot blossom into a larger fire, burning as you enter the area, thus using it to help draw air into the area you are working.

You should not spend so much time on small fires after entering. Get as far as possible into the fire area to knock down the larger fires and pick up the smaller fires when you overhaul.

Short bursts of water directed into the heated area can also be used to help reduce the temperature so that entry can be made.

Remember not to apply water into an area from the outside if nozzlemen are working the fire from the interior. Water with its intrained air has a tendency to move fire, heat, gases and smoke ahead of it, also there is a possibility that the steam that is created will either trap the interior nozzlemen or drive them out of the interior.

The effective nozzleman is the firefighter who has the knowledge and skill gained from training and experience and who can apply these efficiently to a fire situation in such a manner that he will get the best results. In the final analysis it is the nozzleman who is the key to the attack.

2526

HOSE PRACTICES: The techniques and methods used by firemen during drills and at fires consist of certain basic operations or practices which are applied according to the problems encountered. These basic operations have a three-fold objective:

1. Speedy and efficient extinguishment of the fire.
2. Safety to men and equipment.
3. Conservation of energy and manpower.

The Division of Vocational Education is presenting the following basic operations and practice procedures in the hope it will improve the hose work in your department and teach methods to lessen the work involved.

Emphasis is being stressed on "carrying hose"--loading it directly on the shoulder from the hose bed--instead of dumping it on the ground, then dragging or having to pick it up again.

DESCRIPTION OF EQUIPMENT:

FIRE HOSE: Most hose used by fire departments is double-jacketed cotton 2½" and 1½" hose with some 3" and 3½" diameter hose used for special purposes. Other types used by fire departments are:

2. Rubber lined with rubber cover such as chemical or booster hose.
3. Unlined linen hose.
4. Hard suction hoses of different sizes reinforced with steel coils for drafting water.

FITTINGS: Hose work will require the use of special fittings to get the desired layout, the same as a plumber will need fittings to distribute the water supply throughout a building.

Hose accessories most used are:

1. double male couplings
2. double female couplings
3. reducers and increasers
4. adapters for different hose threads
5. hydrant gates
6. gated wyes
7. siameses
8. wrenches and spanners

HOSE CLAMP: The hose clamp is one of the best tools a fireman has for the conservation of energy and manpower. It enables a fireman to get the hose line to the base of the fire without having to strain himself getting a charged line to the fire, instead, by carrying the dry hose on his shoulder, letting it flake off, and at the call for water, the clamp opened to give him water.

Several points to be remembered in the use of the hose clamp are:

1. When clamping line behind the apparatus, place the clamp 20' behind the apparatus.
2. Place the clamp near a coupling (about 3 feet) but not so near that you will have to lift the clamp and a charged line in order to attach the other hose.
3. Be sure the hose is in the center of the clamp before shutting down.
4. When opening the clamp on a charged line, open the clamp slowly so as not to cause water hammer in the hose or not to injure the firemen holding the hose and nozzle.

HOSE BELTS: The hose belt is a device made to assist in heeling hose lines, carrying up a fire escape or ladder, anchoring hose lines to a ladder, stair rail, etc. The type most commonly used consists of:

1. Leather straps; for the body loop and tail piece.
2. Metal parts; buckle, ring, spanner snaps; ladder hook and split link.

NOZZLES: The manufacturers have many types of nozzles being made today. The firemen should learn all they can about each different nozzle such as the best operating pressures, reach, gallons of water used per minute and the proper operation of the control valve.

The firemen must learn to select the proper nozzle for each fire; for instance, using too large a nozzle on a pre-connected 1½" line can empty the booster tank quickly, while at the same time with adequate water supply the nozzle should be adequate discharge to blacken out the fire. Manufacturer's equipment catalogs will give much information in regard to equipment and its use.

LADDER ANCHORS: Firemen working on ladders should be acquainted with the safety features provided by using ladder anchors. A properly anchored ladder will not slip if left unattended and should hose streams be operated from the ladder the anchor will counteract the reaction of the nozzle tending to push the ladder out from the building.

MAKING AND BREAKING COUPLINGS: Basically, all hose work consists of making and and breaking couplings, attaching nozzles, etc. Frequent drills and practice are essential so that this work will be a "natural". Firemen should instinctively know which way to face a coupling (female coupling wears a skirt), which way to turn (turn to right and push down) and whether gasket is in place.

To break a coupling, straddle the hose, facing the female coupling, lift up and hold between legs, grasp the hose beyond the coupling with the left hand and with the right hand turn the swivel to the right, using the thumb to engage the coupling lug for a grip.

To make up a coupling, straddle the hose facing the male coupling, lift up and hold it between the legs, grasp the hose beyond the male coupling, bring them together and with the right hand turn swivel to the right.

To put a nozzle on a section of hose, grasp nozzle with right hand and male coupling with the left hand, then lay barrel of nozzle across thigh (pointing down about 45°) bring them together and turn to the right. For nozzles with leather grips and ladder hooks, it may be advantageous to steady the left hand holding the male coupling against the left thigh and hold the nozzle in the right hand at about a 45° angle. Bring connections together and turn to right. If you want to make the nozzle tighter, place foot on hose just behind male coupling and twist the barrel.

To take off a nozzle place your foot behind the coupling and twist loose with the barrel of nozzle, then lift up nozzle and untwist nozzle same as you put it on.

DIVIDED HOSE BED

One of the most efficient methods of loading hose is to use a divided hose bed for the 2-1/2" hose, with one side being loaded for forward lays and the other side for reverse lays. This arrangement will practically eliminate the use of reverse couplings and prove very adaptable for extension of hose line, using the already flaked hose for "shoulder carrys."

Each side is loaded with the accordion load with the couplings started at the back of the hose bed. The right hose bed is started with the male coupling at the rear of the center dividing board and finished with the female coupling at the top of the load. This side is referred to as the forward load.

The left hose bed is started with the female coupling at the rear of the center dividing board and finished with the male coupling at the top. This side is referred to as the reverse load.

The split or divided hose bed has advantages in that two lines may be laid at one time and when the nozzle is carried attached to the male end of the reverse load, it speeds up laying lines from the fire to the hydrant. By attaching reverse couplings on the starting couplings at the bottom of each load, it is possible to attach the hose from the top of the other side for continuous lays (either forward or reverse lays) which would require the double load of hose.

When lines are laid from the hydrant to the fire and especially when the apparatus cannot get close to the fire, hose from the reverse side (nozzle attached) can be carried to the fire location without guessing how much hose is needed, as the men keep going until they reach the fire, then the man at the apparatus connects the forward and reverse hose lines together. Special couplings will not be needed.

Another advantage of the divided hose bed is apparent when it is necessary to change the hose on the apparatus. Hose can be removed from one compartment and new hose loaded and all during the process the apparatus is available for fire service with at least a half load of hose.

MARKER LOAD

This is simply the accordion load carefully loaded with regard to the location of the couplings. As the flakes of hose are arranged in the apparatus care is

0C 8529

taken to locate the couplings within two feet of the rear of the hose bed and placed so that the couplings will not have to turn around when the hose is being played off the moving apparatus. Every flake of hose (laid in the hose bed) that contains a coupling is made about four inches longer than the rest of the hose flakes.

These marked flakes of hose are definitely advantageous to the pump operator in estimating hose "laid in" from apparatus and is a definite help in taking off a specific amount of hose from the apparatus, as the fireman simply counts off the long loops, one for each section of hose desired, pulls the loop about two feet, breaks the coupling, then lifts the hose out of the bed. It is then free and clear and the fireman does not have to put down the hose, break it, then pick it up from the ground.

LAYING LINES WITH APPARATUS

Use of the divided hose bed provides many quick and easy methods of laying lines at a fire. The firemen's rule "never pass the hydrant and never pass the fire" can be used to greater advantage.

1. Single Line Forward: This lay consists of laying a line of hose from the hydrant to the fire. Where hydrant pressure and flow are adequate to produce good "gravity" streams, the straight lay has an advantage. The fire truck may then remain at the fire and the equipment carried thereon is available for immediate use.

2. Double Line Forward: Where hydrant pressure and flow are known to be good and the fire requires two lines, these can be laid at the same time from the divided hose bed. Use of the double female at the hydrant and double male for a nozzle will be required on the "reverse" hose lay.

3. Single Line Reverse: In situations where the company gets to the fire before a hydrant is reached or in areas where gravity lines are weak due to low flowing pressures, the pumper must be connected. The reverse lay is good practice because it places the pumper at the hydrant immediately after the line is laid.

4. Double Line Reverse: Should the fire require two lines, another nozzle and a double male coupling is attached to the top of the forward hose bed. It is then possible to lay two hose lines at the same time. This operation is especially good where hydrant flow pressure is low. As the pumper is connected to the hydrant, it is desirable to lay two lines in the first operation and thus save laying lines by hand.

5. Forward Lay and Reverse Overhaul: This lay is used when it is impossible to drive the apparatus close enough to the fire to complete a straight lay, or when the lay from the point the apparatus stops is difficult to estimate, such as with a lumber yard fire where the lay is around piled lumber or inside hallways and stairs.

If the apparatus has a double bed, the hose from the hydrant would be clamped and broken and the extension made with the hose from the reverse side of the hose bed which has nozzle attached. When enough hose has been removed, the

ESA530

hose would be broken and attached to the line from the hydrant. It will be noted that double male and female couplings are not needed.

HELPFUL SUGGESTIONS

1. It is good practice when making a reverse lay to send one man to the hydrant with the driver. This is especially true when the pump is to be used. Remove such equipment from the truck as will be needed before it leaves the fire for the hydrant.

2. In laying lines at a fire the hose should be laid close to the curb on the same side of the street as the hydrant which will permit other apparatus to lay to the fire without driving over the hose.

3. On forward lays the apparatus should be driven a short way (50') past the building before stopping, so as not to block other companies coming in.

4. When laying a line for a long overhaul into a lumber yard, dock or across lots, the driver should swing the front end hard away from the fire which will turn the back of the apparatus toward the fire. This will give a much better position for the hose to pull out and is helpful, especially when short of manpower.

5. When responding to alarms and there is a possibility that a line might be required, the line should be laid and charged to the hose clamp. This operation serves the purpose of moving the hydrant closer and makes the hydrant man available sooner. This operation is especially good to back up a fire even though it might be extinguished with a booster line from the truck tank.

MAKING A HYDRANT

Standing on the tailboard of the apparatus the hydrant man grasps the hydrant wrench in the hand closest to the hydrant. The end of the hose with the female coupling is grasped in the other hand.

As the rig approaches the hydrant and slows down, the hydrant man leaves the tailboard of the truck (be sure to face the direction the apparatus is traveling as you can't run backwards). Taking the hose and wrench with him, he proceeds around the outside of the hydrant, holding the hose low, making a snub around the hydrant. Step on the end of the hose that is snubbed around the hydrant and loosen cap on hydrant, facing the fire with the wrench and then place wrench on the operating nut. Finish removing cap, unwrap hose from around hydrant and attach to outlet. Straighten hose and turn on water. Be sure to open the hydrant fully, otherwise the drain valve may be partly open, undermining the hydrant.

For safety reasons, the driver must make sure the hydrant man has secured the hydrant before going ahead. The hydrant man should be trained never to stand in front of hose port caps when removing them nor when opening the hydrant. Remember, the hydrant may be "loaded" or the threads of other caps or the hose may be defective and blow off.

2531

HOSE CARRIES

The use of hose carries in extension of fire fighting lines will eliminate much confusion and needless work. When hose is to be carried to the fire, what is gained by pulling hose on the ground and then picking it up? Why not pull the hose off in such a manner that the flakes stay on the shoulder and still peel off the top when all the slack is drawn out?

When taking hose from the apparatus, put on nozzle (if not already carried attached on the reverse side) pull 50' of hose about half out of the hose bed. Then approaching the load from the open side of the hose bed, turn facing the rear, put shoulder under flaked hose and step away from apparatus. The second man on the load steps in and does the same thing. (This operation could be repeated as many times as there might be men available to carry hose.) When enough hose has been removed from bed, then all men will proceed to fire, the hose will play right off the top of the shoulder load as the line draws tight.

PICKING UP AND LOADING

After the fire is completely out the company shall be put back into service as soon as possible. As only a limited amount of 1½" hose is carried on the apparatus, this should be loaded first.

First one man goes down the hose line breaking all couplings and laying the ends toward the curb so the water will drain away from the hose. Then the hose is picked up and drained in one operation. If working on level ground, start at the coupling furthest from the apparatus, or if on a grade, start at the highest level. It will not make any difference whether the starting coupling is male or female.

Start by placing the coupling in front at about hip level. The fireman then flakes the hose up over his shoulder and down his back until he can touch it with his heel (about a foot above the ground). With about three or four folds on his shoulder, the fireman ends up with both couplings in front of him and proceeds to apparatus. He then determines which coupling is to go into the hose bed, then lays down the hose from either the right or left side so that the proper coupling is toward the apparatus.

Reloading while still at the fire is particularly advantageous for radio equipped apparatus as equipment can be ready for service while still standing by and overhauling. After returning to station, wet hose must be removed and replaced as soon as possible. Equipment will be in service quicker by reloading at the fire as lines are released. Time consumed in loading will be little more than if hose was drained and rolled and stacked on equipment for return to station.

REMOVING EXTRA HOSE FROM APPARATUS

Sometimes it is necessary to remove additional hose from apparatus, such as replacement of burst section, extension of existing hose lines, putting another line to the wye, etc. The following methods, if followed, cut down wear and tear on the hose, dragging couplings and save lifting hose from the ground.

1CSS 2532

Third man (if any) does the same thing.

If it is necessary to advance the hose line across the roof or down a hall after it has been carried up a ladder, proceed as follows:

As the first man reaches the top of the ladder, he steps over the hose, turns around, reaches down, pulls up slack and reloads on his left shoulder. As the second man reaches the top of the ladder, he feeds the hose to the first man, then he steps over the hose, turns around and pulls up slack, loading on his left shoulder.

Last man up the ladder feeds hose to the man ahead, then snaps the tail of his hose belt to the rung of the ladder and steps inside.

The men with hose on their shoulders turn around, dropping one-half of a flake, head toward fire, allow hose to peel off shoulder as slack is drawn up tight.

3. When a dry line is to be taken up a ladder without belts, the men carry sufficient flakes of hose to the bottom of ladder, then the first man picks up hose under right arm 4' from the nozzle, brings hose across chest, lays nozzle over his left shoulder so that nozzle hangs down back.

Second man picks up the hose 25' to 50' behind the first man, places the hose on his right shoulder and climbs the ladder with a loop of hose hanging in front of him and outside the right side of the ladder.

Third man (if any) carries hose in the same manner.

If hose is to be stretched across floor or roof, each man will step off the ladder over hose and reload in flakes on his left shoulder. The man with hose on his left shoulder turns around, drops a half flake and allows the hose to peel off his shoulder as the slack is drawn up tight.

OPERATION OF NOZZLES

The man at the nozzle is the director of the fire stream and the men assisting him should be holding or heeling the line in such a way that the nozzleman may devote all his efforts to directing the fire stream.

In operating hand lines the pipeman positions himself on the right side of the nozzle, picks it up, keeping the hose under his left arm and his right hand on the control valve. The backup man positions himself behind the pipeman, wraps his inside arm around the hose, passing his hand under the hose and grasps the wrist of the other arm. He then grasps the hose with his free hand.

Often too little attention is paid to the manner in which controlling nozzles are opened and closed. If a line of hose is under high pressure and the nozzle is opened too quickly, the line may whip away from the men and do damage. On the other hand, if a stream is flowing through a line and the nozzle is closed too quickly, the water hammer or ram, may burst the hose, blow off a coupling or do other damage.

DUTIES OF THE CREW MEMBERS

Whether a department is manned by volunteers or paid firemen, there is a certain amount of work which has to be done. Basing an engine company crew at four men, let's analyze the work and see what the duties of the crew would be.

First, there must be someone in charge, a boss; he might be the Chief, a Captain, a Lieutenant or a fireman acting as an officer. His duties upon arriving at the fire are to decide what is to be done. For this reason, he takes second place on hose lines so he can see where the line is being taken and also watch the hydrant man and driver to see if they are encountering difficulties. In the order of importance and for the purpose of identification let's call him No. 1.

The next man needed is a driver to drive and operate the apparatus. His duties after locating the apparatus are to put on the hose clamp, then any work or making and breaking of couplings that is to be done at or near the apparatus. For purpose of identification he is called No. 2.

The next man needed is a hydrant man. His primary duty is to get the hose on the hydrant and get water. For purpose of identification he is called No. 3.

Finally, a pipeman or nozzleman would be needed. He has one basic job; to get the nozzle into position to hit the fire. For the purpose of identification he is called No. 4.

Looking at a piece of apparatus the position of the men becomes obvious.

No. 2 The driver's spot is at the wheel.

No. 1 The officer is on the side where he can direct the driver and men on rear of apparatus.

No. 3 Hydrant man on right rear which is forward side of double bed.

No. 4 Pipeman is on left rear to take nozzle.

With a fixed or paid crew , the men could be assigned positions with duties accordingly.

With volunteers, the men taking the positions shown would automatically be expected to do the work assigned to these positions. If more men report, they could be used for hose extension, ladders, salvage work, etc. If fewer report, those present would have to advance work until completed or others arrive to help.

BOOSTER TANK OPERATIONS

The increased use of booster tanks, both in rural and city departments, has shown the need for better understanding of their capabilities and limitations.

1. When hydrants are available, even though the fire is to be fought with a booster line, it is good practice to lay a line from the hydrant to the pumper at the fire even though the line is not charged.

2. When the fire is located off the highway or road, making it impossible for more than one piece of apparatus to maneuver, lay a hose line from the highway to the fire with a hose clamp at the highway. Other apparatus with booster tanks can pump their water into the first booster tank without having to get off the road. By clamping the line the second apparatus is free to go after more water.

3. When more than one company (with booster tanks) responds in an area without hydrants, the first company should attack the fire with booster or 1½" line. Other companies arriving should concentrate on keeping the tank of the first apparatus full. Instead of tying up both pumpers with fire fighting lines, the second company should attach their fire lines to the first pumper. These second companies then either lay a hose line to a hydrant or other source of water or empty their booster into the first tanker and run a shuttle service for water supply.

It should be understood that the average rural apparatus has a 500 to 750 gpm pump while the average booster or 1½" hose stream needs from 15 to 80 gpm. It is apparent, therefore, that this first pumper could handle about 8 to 10 lines without any effort.

However, it must be remembered that in operations where flow of water to the pump is supplied from a tank that the pump discharge will be limited to the amount of water which will flow to the pump. This makes it desirable to have large connecting pipes from the tank to the pump.

4. Whenever one tanker is pumping to another, it is desirable to attach 2½" connecting hose to the intake of the pump supplying the fire lines, rather than to discharge the water into the booster tank. This will make all the flow of water from both tanks available for fire fighting. Should less water be required for fire lines, the water from the second tanker will refill the booster tank of the first pumper. Operators should be prepared to close the tank valve to prevent overflowing when tank is filled. When the second tanker is empty, the tank valve will be opened and the connecting line clamped. The second tanker can then go for more water.

5. It should be remembered that in any pumping operation the friction loss in the intake line is equal to the corresponding friction loss in the discharge lines. Therefore, when a long hose line is supplying water at an appreciable GPM, a second pumper must be connected into the line as close to the hydrant as possible to overcome this friction loss.

6. Remember to close the valve from the booster tank to the pump when operating directly from a hydrant or when drafting water.

2536

HOSE PRACTICES,

Drill No. 1 Four men flake 150 feet of 2½" line for inside stairway and then lay the line reverse to pump at hydrant.

Operation:

No. 2 Stops apparatus in front of building.

No. 1 Gives command: "Reverse lay through pump, 150 ft. of play hose and size nozzle."

No. 4 Pulls the pipe (which is attached) and 50' of hose half out of reverse bed, turns back to apparatus, pulls hose clear, keeps it on shoulder and steps away from apparatus.

No. 1 Then steps in and takes a 50' shoulder load in the same manner.

No. 3 Pulls 50' of hose on the ground and gets back on the apparatus.

No. 1 Turns and grasps hose coming out of bed, braces himself and kneeling on hose, gives order to proceed to hydrant.

No. 2 and No. 3 Proceed to hydrant where No. 3 connects soft suction to hydrant while

No. 2 breaks the line and connects it to discharge side of the pump.

No. 4 and No. 1 Proceed to building, stretching out slack hose as they proceed, letting each flake of hose peel off as they proceed through stairway.

(No. 4 keeps hose on shoulder until No. 1 has unloaded and stretched out).

No. 3 After assisting No. 2, proceeds to nozzle, straightening out kinks.

No. 2 Opens discharge valve at call for water.

2537 2538

Drill No. 2 Four men lay line forward from hydrant to building, then take 150' of 2½" line up a ladder and across a roof or through a building.

Operation:

No. 3 Takes the hydrant, gives water as soon as possible and advances to the hose clamp.

No. 2 Lays the line with apparatus just past the building, stops, puts on hose clamp.

No. 4 and No. 1 Remove ladder from apparatus, carry it to position on building and raise ladder (assisted by No. 2 if necessary).

No. 4 Takes nozzle and 50' of hose from reverse bed, carries it to base of ladder.

No. 1 Takes another 50' to the same place.

No. 2 Takes off 50' or enough to reach and carries to base of ladder.

No. 4 Picks up hose line under right arm, across his chest and lays the nozzle over his left shoulder and climbs ladder.

No. 1 Picks up hose just ahead of next coupling and climbs ladder with hose on right shoulder.

No. 3 Advances to ladder from hydrant and picks up hose the same way and follows No. 1 up ladder.

No. 4 When he reaches top of ladder, steps over the hose, turns around, reaches down, pulls up slack and reloads on his left shoulder.

No. 1 Feeds hose to No. 4 when he reaches top, then he steps over the hose, turns around and pulls up slack, reloading on his left shoulder.

No. 3 Feeds hose to No. 1, then he snaps tail of hose belt to rung of ladder and steps inside or on the roof.

No. 4 and No. 1 Proceed to fire, allowing flaked hose to peel off shoulder.

No. 3 Follows on to fire.

No. 2 Breaks forward and reverse lines, connects them together and at the call for water, opens the clamp.

2538 1237

Drill No. 3 Four men lay two lines with apparatus forward from hydrant to building.

Operation:

No. 1 Gives order to lay double header.

No. 2 Stops apparatus at hydrant.

No. 3 Takes the hydrant with the forward line,

while

No. 4 Removes the nozzle and takes the hydrant with the reverse line and a double female and gets back on truck.

No. 2 Lays the lines with apparatus to just past the fire and clamps and breaks forward line, throwing end back on hose load.

No. 1 Puts clamp on reverse line.

No. 4 Breaks the reverse line, puts a nozzle on the male end then lays hose and nozzle back in reverse bed to line up flakes. He then pulls 50' in flakes half out of the bed, then turns away from apparatus, puts the hose on his shoulder and pulls hose clear.

No. 1 Pulls the next 50' of hose in the same manner and steps clear.

No. 2 Assists No. 1 and No. 4 by giving enough slack to reach fire, then breaks the line coming out of the reverse side and connects it to the forward line that is charged and clamped.

No. 3 Has in the meantime, made the hydrant, has connected the lines and turned on the water and advanced to the clamps. Then if first line is ready, he opens the clamp on the forward laid line.

No. 4 Is left in charge of this line and No. 1 returns to apparatus.

No. 3 Puts another nozzle on the line in the reverse bed and loads 50' on his shoulder as before.

No. 1 Loads the next 50' of flaked hose on his shoulder as before and heads for the fire.

No. 2 Assists No. 3 and No. 1 by giving enough slack to reach fire, then he breaks hose coming out of reverse bed and connects it to the charge clamped line, using a double male. On the call for water, he opens clamp and proceeds to nozzle to assist No. 4 on the first line.

Note: If off-shift men or volunteers respond after arrival of apparatus, they could speed up putting the second line into operation.

2539

Drill No. 4 · Two companies (A & B) (3 men each) with booster tanks.

First company (A) lay 2½" supply line from the road to the fire, operate 1½" hose line from the booster tank.

Second company (B) carry their own 1½" hose and operate from the first pumper then use their booster tank to supply the first.

Operation:

No. 2-A Turns the apparatus off the highway as directed by No. 1-A and stops.

No. 3-A Removes the hose clamp and 25' of hose from the forward hose bed, heels the line and calls to lay in. When the supply line is stretched in, he places the hose clamp on the line, then proceeds to the apparatus.

No. 2-A Drives to the fire and stops.

No. 1-A (Assisted by No. 2-A) Overhauls the pre-connected 1½" hose and operate on the fire.

No. 2-A Operates the pump at the desired pressure.

No. 3-A Overhauls second 1½" line to fire or assists No. 1-A. No. 2-A would assist if necessary.

No. 2-A Breaks the 2½" supply line and connects it to the intake port.

Apparatus "B" arrives

No. 1-B and

No. 3-B Remove their own 1½" hose, carry it and connect it on apparatus "A" discharge port and lay to the fire.

No. 2-B Picks up the 2½" supply line left by company "A", connects it to his discharge port, operates pump at desired pressure, opens the hose clamp and pumps water from his tank to apparatus "A".

When the tank of apparatus "B" is empty, No. 2-B shuts down the pump, clamps the 2½" supply line, disconnects it from his discharge port, leaves it and drives off for more water.

2540 Texas

HOSE PRACTICES,

Drill No. 1 Four men make a forward lay, take 2½" line up stairway.

No. 3 Takes hydrant and gives water as soon as possible.
No. 2 Lays line with apparatus, stopping where directed by No. 1.
No. 2 Clamps line from hydrant.
No. 4 Shoulder loads 50' of 2½" hose from reverse bed with nozzle attached and steps away from apparatus.
No. 1 Shoulder loads another 50' of 2½" hose then pulls off an extra 50' for slack.
No. 4 and No. 1 Proceed to fire, keeping hose on shoulders until the extra 50' of slack is taken up, then they overhaul line up stairway to fire, flaking the hose off, being sure to keep line taut.
No. 2 Makes sure No. 4 and No. 1 have sufficient hose, then breaks hose line to fire from the reverse bed.
No. 2 Breaks the hydrant line, then couples the two hose lines.
No. 3 After making hydrant, advances to hose clamp, assists No. 2 if necessary, then gives water by opening clamp.
No. 2 and No. 3 Follow hose to pipe, taking out kinks as they go.

Drill No. 2 Three men make a forward lay, take 2½" line up stairway.

No. 3 Takes hydrant and gives water as soon as possible.
No. 2 Clamps the hydrant line.
No. 1 Shoulder loads 50' of hose and nozzle from the reverse bed, steps clear of apparatus.
No. 2 Shoulder loads another 50' of hose, then pulling off 50' for slack, steps away from the apparatus.
No. 1 and No. 2 Overhaul line up stairway to the fire.
No. 3 Advances to back of apparatus, breaks both lines coming out of the hose bed, connects the lines together, at call for water opens the hose clamp.
No. 3 Advances to the pipe.

Drill No. 3 Replace burst section.

No. 1 Stays at nozzle and designates 2 men to replace burst hose.
No. 3 Gets hose clamp and clamps line 3' from coupling of burst section. When water is shut off
No. 1 Closes nozzle, breaks coupling of burst hose nearest the pipe, then returns to the pipe.

meanwhile
No. 4 Pulls first marker, breaks coupling, shoulder loads 50' of hose (being careful to have female coupling on top) follows hose line toward the fire.

As No. 4 passes No. 3 at clamp, No. 3 grasps female coupling from No. 4 and
No. 4 stretches hose along side burst section, makes coupling nearest the pipe and calls for water.

Meanwhile
No. 3 Makes his connection and opens clamp and returns to nozzle.
No. 4 Ties overhead knot in burst section (as a reminder to other firemen that section is defective) and returns to nozzle.

2541

Drill No. 4 <u>Four men make a reverse lay, take a 2½" line up a stairway.</u>

No. 2 Stops as directed by No. 1.
No. 4 Shoulder loads 50' of hose and nozzle from reverse hose bed and steps away from apparatus.
No. 1 Shoulder loads another 50' of hose, steps clear of apparatus.
No. 3 Pulls off sufficient slack hose, puts it on the ground and gets back on the apparatus.
No. 1 Keeps the hose on his shoulder, drops to one knee snubbing the hose where it comes from the reverse hose bed, and orders No. 2 to go ahead.
No. 2 and No. 3 Ride apparatus to hydrant, give water using standard reverse pump hookup.
No. 2 Operates pump, opening discharge valve on call for water.
No. 3 Proceeds back to fire.

NOTE: Where pump is not hooked up the No. 3 man could remain at fire instead of riding to hydrant.

Drill No. 5 <u>Three men make a reverse lay, taking 2½" line up a stairway.</u>

No. 2 Stops apparatus as directed by No. 1.
No. 3 Shoulder loads 50' of hose and nozzle, steps clear of apparatus.
No. 1 Shoulder loads second 50' of hose, turns around, keeps hose on his shoulder, pulls to the ground sufficient slack, snubs the hose where it comes out of apparatus, orders No. 2 to go to hydrant.
No. 2 Proceeds to hydrant, breaks the hose line from apparatus, attaches it to a discharge port, then attaches soft suction to hydrant, turns on water and operates pump.
No. 1 and No. 3 Keep hose on shoulders, flaking it off as they proceed to the fire.

Drill No. 6 <u>Four men make a forward lay, hoisting line with a roof rope.</u>

No. 3 Takes the hydrant and gives water as soon as possible.
No. 2 Lays the line with apparatus and stops as directed by No. 1.
No. 2 Clamps the hydrant line.
No. 4 Takes roof rope and axe and goes to roof or designated floor and throws out the roof rope.
No. 1 Shoulder loads 50' of hose and nozzle from reverse bed and carries it to location where rope is to be dropped.
No. 2 Assist No. 1 by carrying over sufficient slack hose, then breaks hydrant and reverse hose lines and connects them together.
No. 1 Goes to assist No. 4.
No. 2 Goes to nozzle, makes hose knot, slides hose through knot about 8 feet.
No. 1 and No. 4 Using standard "Roof Rope Raise" pull up hose and carry hose to fire.
No. 1 Calls for water.
No. 3 Opens hose clamp.
No. 3 and No. 2 Advance to fire.

2542

Drill No. 7 <u>Four men make a forward lay, carry hose up a vertical fire escape</u>.

No. 3 Takes the hydrant and gives water as soon as possible.
No. 2 Lays the line with apparatus and stops as directed by No. 1.
No. 2 Clamps the hydrant line.
No. 2 Gets baby ladder and places it against bottom of fire escape.
No. 4 Shoulder loads nozzle and 50' of hose from reverse hose bed and steps clear of apparatus.
No. 1 Shoulder loads next 50' and steps clear.
No. 4 and No. 1 Carry hose to the base of fire escape and lay hose on ground.
No. 2 Assists by bringing sufficient slack, then breaking hydrant line and reverse hose line and connecting them together.
No. 4 Snaps belt behind valve of nozzle and climbs the ladder.
No. 1 Spaces out 25' to 50' behind No. 4 and climbs ladder, staying 10 to 15 feet behind No. 4 so as to steer nozzle through fire escape landing.
No. 2 Climbs 25 to 50 feet behind No. 1 and reaching top of fire escape anchors line to fire escape with tailpiece of hose belt.
No. 4 and No. 1 Carry line to fire and call for water.
No. 3 Opens clamp and advances to the fire.

Drill No. 8 <u>Four men make forward lay, with 2½ " hose and take 1½" hose to the fire</u>.

No. 3 Takes the hydrant and gives water as soon as possible.
No. 2 Lays the forward 2½" hose and stops as ordered by No. 1.
No. 4 Shoulder loads first half of 1½" hose and steps clear.
No. 1 Shoulder loads second half of 1½" hose.
No. 4 and No. 1 Proceed toward fire and set down wye outside building.
No. 2 Clamps the hydrant line, pulls off sufficient 2½" hose to reach wye, breaks the hydrant line and connects it to the 1½" wye.
No. 3 Advances to the clamp and at the call for water, opens the clamp.
No. 3 and No. 2 Proceed to the pipe.

In case second line of 1½" hose is called for, No. 3 and No. 2 would shoulder load hose and carry to wye.

2543

Drill No. 9 <u>Four men back up 1½" line with a 2½" line</u> (If 2½" x 1½" wye is used)

No. 1 Stays with 1½" nozzle operating on fire.
No. 2, No. 3, No. 4 Return to apparatus for 2½" hose.
No. 3 Steps up to reverse 2½" hose bed, pulls marker for required amount of hose and breaks coupling.
No. 4 Puts on nozzle if not attached and shoulder loads 50' of 2½" hose and steps away from apparatus.
No. 2 Gets the hose clamp and 2½" x 2½" wye.
No. 3 Shoulder loads second 50' of 2½" hose and steps clear of apparatus.
No. 2 Gives the hose clamp to No. 4 to carry and gives the 2½" wye to No. 3 to carry.
No. 2 Then shoulder loads third 50' of 2½" hose.
No. 4, No. 3, No. 2 Proceed toward fire.
No. 4 Sets down clamp at 1½" wye. No. 3 Sets down 2½" wye next to 1½" wye.
when No. 2 is 25 feet beyond the wye he drops his load and drags the female coupling back to the two wyes, and connects the back-up line to the 2½" wye.
No. 4 and No. 3 Continue overhauling toward fire, where No. 3 has stretched out his hose and returns to assist No. 2.
No. 2 Clamps 2½" charged line, then
No. 2 and No. 3 Disconnect 1½" wye, connect 1½" wye to 2½" wye, and 2½" wye to clamped 2½" line.
No. 4 Calls for water.
No. 2 Opens clamp.
No. 3 Returns to assist No. 4 at nozzle.
No. 2 Returns to pump, (if reverse lay) or to nozzle (if forward lay).

Drill No. 10 <u>Three men take charged 2½" line (laying on the ground) up a ladder and operate into window or on roof.</u>

No. 4 Snaps tailpiece of hose belt 12" behind the pipe and lets is hang down on his right side.
No. 3 Snaps his hose belt 8 feet behind No. 4 and lets it hang on his right side.
No. 1 Snaps his hose belt 10 feet behind No. 3 and lets it hang on his right side.
No. 4 In the lead, all advance to the ladder at a 45° angle from the left and all climb the ladder and
as No. 4 reaches the top, he grasps the rung with his left hand, reaches down with his right hand, pulls up the nozzle, slides it through the rung.
(While No. 3 below No. 4 lifts up the hose)
No. 4 Throws his right foot over the hose, straddling it, then hooks the tail of his belt on the rung above, then locks in with his left leg, throws one arm through the ladder and the other around the ladder and operates the nozzle.
No. 3 Hooks his line straight on the ladder, then climbs up behind No. 4, straddles the line, reaches around No. 4, grasps the beams to hold pipeman in position.
No. 1 Hooks his line straight on the ladder, then climbs down.

PUMPER OPERATION

CENTRIFUGAL TYPE PUMP. The most modern and latest type of fire pump that has been developed and is practically in universal use today is the centrifugal pump. It is perhaps the simplest and develops less trouble than other older types of pumps due to the simplicity of design and with just a few moving parts. Because this is the type that the majority of fire departments use today we will devote more time in describing it and all the accessories that are used in conjunction with it.

This type of pump may be a single stage with one impeller or a multiple stage with up to three impellers and actually could be built with an unlimited amount of impellers if needed. A centrifugal pump has impellers rotating within a metal housing with the outer edge of the impellers just barely clearing the housing. The impeller is circular in shape and hollowed out and divided into sections by curved vanes within this hollow area, the center or eye is large in size and is the inlet opening for water to enter the impeller where, as the impeller is rotated at fairly high speeds the centrifugal force throws the water outward and the vanes channel it out through the discharge vents on the perimeter of the impeller into the discharge chambers and out of the pump into attached hose lines. These impellers vary in size and some of the smaller capacity pumps might have larger impellers than pumps of a greater size. The amount of water being discharged depends on two factors:

1. The size of the impellers and
2. The speed of the impellers.

Thus a 9 inch impeller at 1,000 RPM would not discharge as much water as a 6 inch impeller at 2,500 RPM. So both size and speed of the impellers have a bearing on the discharge potential of any centrifugal pump.

Ordinarily the speed of the pump impellers is from 1½ to 2½ times the RPM of the engine motor. This increase is accomplished by the gear box of the pump transmission. A centrifugal pump is not a positive displacement type pump; in other words, if the pump were running and all discharge ports on the pumper were to be closed there would be a 100% slippage or churning of the water within the pump itself. The motor would not stall due to the slippage within the pump.

There are several methods of engaging pumps in gear depending upon whether the pump is a single stage, multiple stage, electro-matic type and electro-matic type with a failure in the electrical system to the controls, or type of

2545

priming device used.

First, let us discuss the single stage pump; this is generally a pump with a 500 GPM capacity or less. In all cases, read the manufacturer's operational book, as different manufacturers may vary as to the gear recommended for pumping.

Basically you have arrived at a fire and are going out to put the pump in operation. Take the pump transmission shift lever and change from road position to pump transmission, place the gear shift lever into direct gear. Here your manufacturer's book will tell you which is direct gear - it might be third gear or fourth gear depending upon the gear ratio of your particular apparatus. It also will depend on the type emergency brake as to which and how applied. Some apparatus have the hand emergency brake connected to the drive shaft and if the brake is applied and the pump is put in gear then the minute the clutch is released the motor will stall. Generally speaking, they have an automatic brake lock, either operated manually or by flipping an electric switch.

We will now assume that you have the proper brake applied, the pump transmission engaged and the gearshift lever in the proper gear, then, in this type the main pump is engaged and running. You are connected to a source of water supply and hose lines are attached. Then, all you have to do is advance the throttle to the desired operating pressure.

Next, let us discuss the fully electro-matic type pump. This pump is put into operation in the same manner as the single stage pump.

Next, let us discuss the multiple stage pump with a manually operated gear driven primer pump. In this type you perform the same operation in the cab as for the single stage pump but when you transfer the transmission it does not start the pump to operate but merely transfer the transmission from direct road into the transmission box of the pump unit. As you get out of the cab on the side of the apparatus just above the running board and below the pump operating panel you have another pump lever. This pump lever has three positions:

1. Road position which is where it will be at all times as you get out of the cab.

2. Prime pump position.

3. Main pump position. As you raise this shift lever slightly to clear the notches of each position it automatically depresses the clutch pedal and you move the lever to main pump position and as you lower this lever into the notch it releases the clutch and engages the pump in gear. All you have to do then is advance the throttle to the desired pressure.

Next, let us discuss the electro-matic that has an electrical failure in the wiring to the operating or control panel. Then you would have to operate manually the accessories that work different parts of the pump.

To make a pump and motor elastic in the operation of the pump there are a few accessory appliances incorporated with most pumps and these, if utilized right can give you great efficiency in the pump operation.

<u>TRANSFER VALVE</u>. This valve is found only on pumps that have two or more stages. There are many models and variations but all basically perform the same

2546

function. By the use of the valve you change the course of the water within the pump from parallel operation to series operation. In series operation you have doubled the potential pressure but halved the volume or quantity of water. Perhaps it might be well at this time to explain the assembly of a two stage pump.

In parallel (VOLUME) operation we have two impellers receiving water from a common intake and each pumping into a common discharge at pressures ranging up to 150#.

When the transfer valve is changed to series (PRESSURE) the water inside the pump is changed so that the water enters one impeller. It leaves the discharge side of this impeller and then enters the inlet of the second impeller which increases the pressure to double that of the first impeller but the capacity (VOLUME) has been decreased by one-half due to the fact that only one impeller is discharging water from the pump. Thus we have doubled the pressure but halved the quantity.

The transfer valve ordinarily should be changed only at pressures of 50# or less. When the transfer valve is changed, two clapper valves at or near the suction intakes on either side close or open. They are open when the valve is in Volume position and closed when the valve is in the Pressure position. This is done in order to direct flow of water into the proper waterways within the pump and is caused by the pressure of the water being discharged by the first stage impeller.

If this Transfer Valve is changed at high pressures, a noise takes place as the metal clappers are banged against the metal housing of the pump. The Transfer Valve (manual) generally requires three or more complete turns to change from one position to the other. Always make sure that the Transfer Valve has been fully opened or closed.

Fire pumps are put into two classes. Class A and Class B.

Class B pumps will pump their rated capacities at 120#. (This will apply to older model pumps.)

Class A pumps (this rating came into being about 10 years ago) will pump their rated capacities at 150# pressure. A flat statement of this type is erroneous because it applies only when pumping at draft, or from tank where the intake suction pressure is practically at zero. If, on the other hand, the pump is connected to a hydrant at 100# pressure then, in theory, you may add this 100# to the volume pressure of 150# and still be able to be in parallel operation and pump the rated capacity at 250# pressure, the only limiting factor being the horsepower of the engine of the fire truck.

Water has weight and it takes horsepower to move this weight and the smaller the horsepower the less water you can pump at given pressures and volumes.

PRIMING PUMPS OR PUMP PRIMERS. Here again we roughly have three different types of priming devices.

1. The gear type priming pump which can be operated by electric energy or engaged manually.

812547

2. The engine vacuum type where the vacuum created in the intake manifold is utilized as the priming agent.

3. The exhaust primer where the exhaust from the gasoline motor is used through a venturi type tube arrangement to act as the priming agent.

These priming devices must be used to prime a centrifugal pump if we are to draft as a centrifugal pump cannot create a vacuum within the pump itself. A pumper, in order to draft water, must be exhausted of air and completely filled with water. Then and only then can it draft water.

ELECTRIC PRIMER - OPERATION. The main pump discharge valves, drain valves and other pump openings must be closed and the suction hose connected to the suction intake, with the strainer and end of hose immersed in the source of supply. Make sure when the transmission lever is fully in main pump position that the gear shift lever is in the proper gear (direct). Then from the operating panel of the pump push in on the electric priming button and hold it in until the pump is primed. This is a gear type positive displacement priming pump and when you press in on the priming button it immediately starts the priming pump and the main pump, thereby allowing the air or air water mixture to be drawn into the priming pump and out its discharge pipe. It also allows the oil from the priming pump oil reservoir to be drawn into the priming pump and lubricates and seals all air leaks within the priming pump.

Allow the priming pump to run until it discharges a solid stream or perhaps we should say, a continuous stream, as sometimes the discharged water strikes a cross brace or rod under the apparatus and is broken up into a splattering stream. To start with, the air water mixture being discharged is intermittent but gradually becomes continuous if the pump and connections are tight.

If the priming pump does not prime the pump within 30 seconds, stop the priming operations and check for air leaks in the suction hose connections. Also, make sure the priming pump is being lubricated by the priming oil tank. Generally, with the new modern electro-matic pump units, the minute the main pump is primed there is a positive pressure reading on the discharge gauge. After the main pump has been primed it is only a question of using the throttle slightly, making sure there is pressure on the discharge gauge, and then opening the discharge ports to the attached hose lines; then advance the throttle until the correct pump discharge pressure is obtained for the particular hose layout into which you are pumping.

If the electric primer refuses to operate due to electrical trouble you will have to utilize the manual override lever and operate the priming pump by changing the pump transmission lever to the priming pump position and then from the operating panel you will have to pull out the priming valve lever manually.

The priming pump operates the same way as by the electric method.

PRIMING PUMP (Manual Operated Gear Pump). The majority of fire pumps (two-stage) prior to the advent of the electro-matic development of operation use a different system when equipped with a gear driven priming pump. In addition to the pump transmission lever in the cab of the apparatus, there is a pump transmission shift lever on the side of the apparatus at the operating panel. This is a three-position lever:

1. Road or neutral

2. Priming pump

3. Main pump

When drafting or starting to draft, close all discharge ports, drain valves and other pump openings, connect the suction hose to the pump and immerse the strainer and end of the section hose in water. You are then ready to draft.

The pump transmission lever in the cab is put in pump transmission and the gear shift lever in direct drive. Then from the operating panel you raise up on the pump transmission lever; as you raise it from the road or neutral position it activates the clutch and you move the lever to the prime pump position; as the lever drops into the prime pump position it engages the prime pump.

You then pull out on the priming valve (make sure it is fully opened) then advance the throttle to a maximum of about 30% of its peak speed. Then look under the apparatus and watch the discharge from the priming pump. It will act in the same way as described for electro-matic operation. When fully primed, push in on the priming valve lever, reduce the throttle speed and shift the pump transmission lever from priming pump into main pump position. Look at the discharge pressure gauge and at about 50# pressure open the discharge ports slowly (on some apparatus when the discharge ports are opened the pressure gauge will drop down momentarily). Then advance the throttle until the desired pressure and volume are obtained.

ENGINE VACUUM PRIMER. The engine vacuum primer is essentially an air valve designed to prime centrifugal pumps by utilizing the intake manifold vacuum of the truck engine. It consists mainly of a metal body with cover that contains a main float valve assembly, auxiliary float assembly with shut off valve, air vent piping and operating mechanism.

The maximum lift at which it will prime a pump is, therefore, directly dependent upon the available manifold vacuum. Most truck engines, running under "no load" conditions will develop from 18" to 22" HG at speeds ranging to about 35% of peak engine speed. A 20" HG vacuum corresponds to 22 ft. water lift which means that it would be possible to draft water up to this limit. However, if the condition of the motor is poor or ignition, carburetion or valves do not function properly, then the vacuum producing ability of the engine will be decreased.

The shortest priming time is at approximately 35% of peak engine speed. The engine will not produce a greater vacuum at this speed with the primer turned off; it will have a greater "breathing" capacity and will produce a higher vacuum with the primer in operation. The engine vacuum is a semi-automatic device which is put into operation manually at the beginning of the priming sequence and automatically shuts off when pump is primed.

When the engine primer is in the cocked position, the main float is at the bottom of the tank and the air vent to the manifold is open. As the water enters the tank the water causes the float to rise and when it reaches a certain level it closes the air vent, the air from the pump having been exhausted through the air vent. The float valve acts on the lock plate and release plate and moves them to the off position indicating to the operator that the pump is primed.

2549

If for any reason the primer does not complete the cycle, a further rise of water in the primer will cause the auxiliary float to rise, closing the air vent shut off valve, thus preventing water from entering the engine.

OPERATION. With the pump transmission lever in the cab in pump position and the gear shift lever in direct gear, from the operating panel close all main pump discharge valves, drain valves and other pump openings. Prior to this, of course, the suction hose would have been connected to the suction intake and the strainer and end of the suction hose immersed in the water.

Turn the priming valve to the "On" position, advance the throttle (engine speed) to about 35% of peak, pull the operating rod of the primer out to the limit of its travel, and allow it to return to the midway or "cocked" position. When the operating rod jumps to the "Off" position, immediately turn the priming valve to the "Off" position to prevent the pump from losing prime and to drain the primer. Engage the main pump and advance the throttle slightly. Open the discharge ports slowly and then advance the throttle until the desired pressure and volume are obtained.

EXHAUST PRIMER. The exhaust type primer utilizes the exhaust from the engine to create a vacuum. The primer consists of a metal body, exhaust valve ejector nozzle and body and the priming valve. During the priming operation, the exhaust valve is closed, which causes the exhaust gases to be diverted through the ejector creating a suction which evacuates the air from the pump. This air is evacuated from the pump to the primer when the priming valve is opened. The venturi tube principle of priming is where a small amount of air or water passing through a small orifice at high speed creates a vacuum and pulls a large amount of air and water with it. After the pump is primed, the priming valve is closed and the exhaust valve is opened which allows the exhaust gases to excape in their normal manner.

OPERATION. With the pump transmission lever in pump transmission and the gear shift lever in direct gear, first connect the suction hose to the intake and immerse the strainer and hose into the source of supply. Close all the main pump discharge valves, drain valves and other pump openings. Let the engine idle. Close primer exhaust valve and open the priming valve. Open the throttle to 1/2 to 2/3 of peak speed. When water is first exhausted it will be mixed with air; continue priming for a few seconds until a continuous flow of water appears from the primer exhaust. Close the priming valve, slow the engine to idling speed, engage the main pump, then open the exhaust valve. Advance the throttle until a discharge pressure of 50 to 75 pounds is reached Open the discharge ports slowly and advance the throttle until the desired discharge pressure and volume has been obtained.

PRIMING OIL TANK. The priming pump (gear type) is generally furnished with an oil tank connected by means of metal tubing. The size of the tank may vary from one quart up to a gallon in size. Whenever the priming pump is operated it is lubricated by oil from this tank being drawn from the tank through the metal tubing into the pump itself. This oil acts as a lubricant and also a seal for the pump.

The oil used is generally SAE 30; however, heavier weight oil, 40 or 50 may be used, especially in warm weather. An air vent located at the highest point in this oil line - generally at the top of the elbow on the tank - prevents the oil from being siphoned out of the tank when the priming pump is

shut off. This hole is made with a drill #60 which is .040 in diameter. Be sure that this vent does not get clogged or the oil could be siphoned out of the tank. Do not enlarge the hole or it might prevent the priming pump from drawing oil from the tank.

AUTOMATIC RELIEF VALVE. A relief valve is a device that relieves or governs the amount of pressure being produced on the discharge side of the pump. In the old days and on the gear or piston type pump the main purpose of the relief valve was to prevent the pressure build-up caused by shutting down the nozzles being put against the gears or piston and stalling the pump.

Different manufacturers use different types and sometimes slight variations in the principle of operation but the theory of these relief valves will fall into one of the two basic types. Some are called relief valves and some are called governors; they use entirely different principles in their method of controlling pressures. They are commonly called automatic but before they become automatic in their operation certain manual manipulations of control valves are required to adjust them to proper or desired pressures.

Either of these two types are generally effective at pressures of 100 lbs. or even when they are put into operation.

In the centrifugal pump the relief valve provides an entirely different function than that of the gear or piston type pump relief valve. As the centrifugal pump has the ability to have 100% slippage, shutting down all the lines would not stall the motor. The principle of the relief valve is to prevent pressure surges in one or more lines when other lines attached to the same pump are shut off.

Perhaps the best way to explain is to use an example. Two lines are attached to the pump discharging 500 GPM at a discharge pump pressure of 150 lbs. This requires a given amount of energy being produced from the engine of the pumper. We now shut one line down without the relief valve being used. The amount of energy from the motor is the same but it is now only being used to pump 250 GPM. This energy then immediately produces a sudden sharp increase in pressure on the one line and can knock the men handling the line off their feet. In theory, if we were to disregard friction loss in the hose line the pressure at the nozzle would be doubled.

RELIEF VALVE TYPE. This is a device containing certain valves, tension springs and is built into the pump where a by-pass line connects the discharge side of the pump with the suction or intake side of the pump.

There are several different types made by manufacturers but they all perform the same function and basically do the same things. They are put into operation automatically in some types when the pressure reaches the setting, and others require the opening of a valve before they will operate. They are all classified as spring loaded valves.

Let us take one type the Hale Ideal Relief Valve. Note--in this type the knurled adjusting knob should always be turned to the right as far as it will turn or above any operating pressures at which you will operate the pump. This merely puts the maximum amount of spring tension against the valve piston which is closing off the by-pass tube.

OPERATION. Connect the pump to a source of supply (it makes no difference whether from a hydrant or from draft) then having one or more lines connected, open and discharge water from the discharge ports. The pump is in gear. Advance the throttle until the desired pressure is obtained on the discharge gauge. Location of relief valve will govern method of setting.

If the entire valve assembly except the knurled knob and bleeder cock are within the body of the apparatus, only the following method can be used. Open the bleeder cock which is located just below the knurled knob. A little water may bleed out of it. Then turn the knurled knob to the left until water under pressure comes out of the bleeder cock. Turning the knurled knob too fast probably will cause the pressure to drop 5 to 10 lbs. below what is desired. Gently turn the knob to the right until the water from the bleeder cock loses its pressure. Close the bleeder cock and the valve is operating. You should have 150# of water pressure on one side of the valve and 150# spring tension holding it shut.

When one or more hose lines are shut off, the water pressure builds up and overrides the spring tension, opening the valve and allowing the water to be sent from the discharge side of the pump back into the intake side. When the lines that were shut down are reopened then the spring tension pushes the valve back into place and closes the by-pass. If the knurled knob was turned to the right as far as it would go (highest pressure setting) it would take at least 25 full turns to the left to reach the lowest pressure setting.

If the entire valve assembly is mounted outside the apparatus body, the previously described method can be used. About one-half of the threaded housing is cut away for visibility. On the side of this cut-away pipe you will see a V shaped notch on the left-hand side. The center of the piston head is also in the form of a V. Advance the throttle to the desired pressure, turn the knurled knob to the left and continue turning until the V of the piston plunger is even with the V of cut-away pipe, then the relief valve is set at that pressure.

WATEROUS TYPE. On this type the relief valve remains inoperative until the four way valve (labeled Relief Valve) is moved from the "off" to the "on" position. Than it is only necessary to turn the pilot valve handle to the left until the pressure gauge drops to the desired discharge pressure. Again always make sure the pilot valve is set above any normal working pressure when you shut down the pump.

PRINCIPLE OF OPERATION. All the relief valves are controlled by the pilot valve and are mechanically devised so that the pilot valve will actuate the main relief valve at the desired pressure when the pump operator has it properly adjusted. The Waterous Relief Valve is a spring-actuated device and operates on the same principle as does the Hale Relief Valve with the exception that the Waterous Four-Way Valve must be turned to "on" position to put the relief valve in operation.

OPERATION. After placing pumper at source of supply, connect necessary lines to the discharge ports, open and commence discharging water. The pump is in proper gear. Advance the throttle until you have reached the desired operating discharge pressure. Turn the four-way valve from "off" to "on" position. Turn the pilot valve handle to the left until there is a slight pressure drop on the discharge gauge. Then turn slowly to the right until the pressure is again at

LCCS 2552

the desired level.

THROTTLE ACTUATED GOVERNOR (Relief Valve). This operates on an entirely different principle than does the spring loaded relief valve. In the spring loaded type that was described previously, an increase of pressure over the setting of the relief valve merely opens a by-pass valve and relieves the increased pressure by discharging water back into the suction side of the pump and the motor speed tends to remain constant at all times. In the throttle actuated type there is no by-pass valve but through a mechanical arrangement consisting of a metal housing, rubber diaphragm, springs and necessary piping with valves, an increase of pressure closes down the throttle which slows down the motor and drops the pressure back to where the governor has been set.

Here again there are two different types but they perform the same basic fundamentals and operate practically the same.

TYPE 1. On this type there is a metal housing with a rubber diaphragm completely across the center, which divides it into two chambers. One of these chambers is connected to the discharge side of the pump and is full of water. On the other side is a piston which is held against the diaphragm by spring tension. The piston is connected to the carburetor by a shaft and the action of the piston being forced backward by the increase of water pressure on the rubber diaphragm then reduces the speed of the motor. When the increase of water pressure against the diaphragm has been reduced, then the spring tension against the piston forces the diaphragm back, which in turn accelerates the motor.

OPERATION. This type is generally mounted on the pump operation panel and is controlled by three valves. One is the governor drain valve, two is the valve which puts the governor in operation by allowing water under pressure to enter the housing of the governor. Three is the hand wheel which regulates the spring tension on the piston within the governor housing.

After placing the pumper at the source of water supply and placing in operation one or more lines, with the pump in proper gear, advance the throttle until the desired pressure is obtained. Then open the governor operating valve. Then momentarily open the drain valve and close it. Turn the Pressure Regulator Hand Wheel to the left or right (this depends on whether it is a left hand or right hand thread on the valve stem). We will assume that turning to the left is the way to reduce the spring tension. Then turn hand wheel to the left until there is a pressure drop on the discharge pressure gauge. The engine will slow down slightly. If you have turned the handle too far gradually turn to the right until the proper pressure is obtained. (Note: Sometimes the governor lags a little so when readjusting wait momentarily after each adjustment.) When it appears to be at the desired operating pressure, shut down and open a discharge port to make sure it is set where you want it. Pull the throttle all the way out.

TYPE 2. (Used generally on 500 GPM and is generally mounted under the hood and adjacent to the carburetor.) It operates on the same principle as Type 1 except it uses a gear train arrangement to control the speed of the motor. On this type the only valve on the operating panel is the valve wheel that puts the governor in operation. There is no drain valve and the Pressure Regulator Hand Wheel is small and built into the governor assembly under the hood. On

BOOK 2553

this type a shaft runs through a housing attached to the carburetor and continues on into the metal housing of the governor. There this shaft is connected to the piston that presses against the rubber diaphragm within the governor housing, the water is in the other chamber pressing against the diaphragm. This shaft where it passes through beneath the carburetor has a gear attached which meshes with a gear that is linked to the motor throttle. Thus as the piston moves back and forth, when pressure changes cause the carburetor to increase or decrease the flow of gasoline, the motor speed changes.

This type is put into operation in the same manner as the other type except it does not have a drain valve and you will have to depend on motor speed to tell when it has reached the proper setting.

RADIATOR COOLER. This is commonly known as a heat exchanger. The water from the radiator runs through a small tank that varies in size from 4" to 8" in diameter and from 10" to several feet in length. All of the water from the cooling system of the motor passes through this tank. Connected to the shell of the tank is small piping and it is coiled throughout the length of the tank. The piping runs from the main pump through the coils within the tank and is discharged to the ground. When the Radiator Cooler Valve is opened the cold water passing through the coils cools the water of the cooling system. It is well to remember that a gasoline motor develops its peak efficiency between 180 degrees and 200 degrees so do not overcool the water in the engine cooling system; when using the cooler valve, open the valve slightly and watch the radiator temperature gauge.

RADIATOR FILL. The radiator is connected to the pump by a small diameter piping and controlled by a valve labeled Radiator Fill. The purpose of this valve and piping is to allow cool water to be introduced into the radiator when the radiator or cooling system has become too hot and boils over and out the overflow tube. This is used where the apparatus is not equipped with a radiator cooler. When using the radiator fill valve just barely open it, the pump may be operating at high pressure and if the radiator fill valve were to be opened fully, the amount of water under pressure may be in excess of the overflow pipe capacity and this excess build-up of pressure would then split the seams of the radiator and you not only would have a costly and time-consuming repair bill but your pump would be out of service at the moment the seams split. Again, let me caution you abour over-cooling your motor.

Do not use Radiator Fill when drafting salt water.

BOOSTER COOLER. This is a piping arrangement whereby a small amount of water is circulated back into the booster tank from the discharge side of the pump when using the booster tank. On some apparatus that have a booster tank fill valve the piping is somewhat larger but it can be used for the same purpose by barely opening the control valve.

This valve is utilized to cool the water within the pump when the pump is merely churning. When a centrifugal pump is running and is not discharging water (this happens quite frequently in the latter stages of a fire) the 100% slippage within the pump allows the impellers to keep on turning; this friction gradually increases the water temperature within the pump, it dissipates to the metal of the pump and if allowed to continue, could damage packing glands and bearings. By using the water from the booster tank and circulating it through the pump and back into the booster tank the heat rise is kept to a minimum.

CCDS 9554

PUMP PACKING GLANDS. The pump packing glands should not be cinched up but should only be tight enough so that it does not drip when standing, but when pumping under pressure there will be a very slight drip; this allows the cold water to act as a cooling agent and keep the bearing cool.

PUMP STRAINERS. These are made of a metal mesh and are recess-mounted in all the section openings of the pump. They should be checked after each pumping operation. Their purpose is to prevent debris of any kind from entering the pump and either damaging or lodging in the working parts and causing damage to the pump or causing loss of part of the capacity of the pump.

In reference to losing part of the pump capacity, if a foreign object such as a small stick or piece of paper that is small enough to enter the eye of the centrifugal wheel is then thrown outward but is too large to go out of the discharge opening of the centrifugal wheel it will then lodge and a percentage of the discharge capacity will be lost. Paper, wood, leaves and other obstructive materials can and will be lodged against the strainer screens of the pump.

There is also a strainer on the end of the suction hose; when this is in place the effect is the same as two strainers protecting the working mechanism of the pump.

PUMP DRAINS. All fire pumps are provided with drains at the base and other low spots of the pump. There may be any number from a single drain up to as high as 8 drains. Some manufacturers manifold these drains so that one valve may open a number of drains at the same time. Other manufacturers have a valve for each drain. These drains are used for a number of purposes.

1. To help flush out the pump when salt or other corrosive water has been pumped by the engine.

2. To drain all parts of the pump in extremely cold weather and keep the pump and/or housing from being cracked by the expansion of water being changed into ice.

3. To drain the pump thoroughly prior to running the Underwriter's acceptance test or the yearly service test.

TIPS WHEN DRAFTING. The less the vertical lift, the less time it will take to prime the pump and the less the lift the more it will increase the pump capacity up to a certain point.

The transfer Valve should always be in volume (capacity) position when starting to draft. To find the most efficient point of operation when pumping either from draft or hydrant is to operate the pump at the slowest RPM for the desired discharge pressure. To do this, merely notice the RPM at the desired pressure, drop the pressure to 50#, change the Transfer Valve to the other position, then increase the throttle. If the desired pressure is reached at less RPM's, the position with the Transfer Valve is correct; if the same RPM is reached and the pressure is down, then change back to the original position of the Transfer Valve.

Always check the suction hose for foreign objects in the hose (rope, collapsible ladder, applicators, etc.) before connecting together and

attaching to the pump. Make sure the end of the suction hose is immersed into at least two feet of water. Use the rope from the strainer to support the end of the hose and keep the strain from the couplings.

Make sure that the pump intake is higher than any point in the suction line.

Keep the strainer well clear of the bottom.

When drafting, watch the strainer end of the suction if short of water coverage. Whirlpools may form and if air gets into the end of suction hose, the prime will be lost. Long boards, a ladder, etc., may be used to break up the whirlpool effect.

Pump operators should learn especially to do one thing - practice putting the pump in gear. It is true a number of manufacturers put locks in the cab so that the pump, in theory, can only be locked in the proper gear but many times it also can be locked in the improper gear. Take time to transfer transmissions and put in direct gear and then with the motor idling look at the speedometer. Compare the speed then for direct or pump gear. Doing this at the station or practice when not under strain will perfect technique, then under stress and strain conditions at a fire, a glance at the speedometer will show whether or not the speed is correct.

Remember also, never overcool the motor; 180 degrees to 200 degrees is ideal for pump operation.

Make sure all connections are tight with good gaskets when connecting to the pump.

ANNUAL TEST OF PUMPERS. Pumps are required to be tested annually if full credit is to be given by the Rating Bureau.

The purpose of the annual test is so that a comparison can be made from year ro year of the pump's capabilities. If there is a variance of the different items such as RPM, it gives indications that the pump or motor of the apparatus is losing its efficiency and is in need of maintenance work.

If the pump is not able to deliver its rated capacity and the RPM of the motor is not as high on a service test as it was on the acceptance test or on the previous year's test, the trouble lies in the motor. On the other hand, if the RPM were as high or higher than on the acceptance test or previous year's test, the trouble lies in the pump.

The difference between the acceptance test and the annual service test is the length of time that the pump is tested, plus the fact the intermediate pressure test is eliminated.

Service tests should be made annually and the results and records of these tests should be filed.

PUMPER CLASSIFICATIONS. Pumpers are rated in two classes by the National Board of Fire Underwriters; however, since 1957 the Class "B" specifications, they must be taken into consideration and tested under these conditions. However, if the apparatus has ample horsepower it might be well to determine if

they will meet Class "A" requirements. If they do pass the Class "A" requirements, then continue to test them as Class "B". The Class "A" requirements are more stringent upon the capabilities of the pump.

A Class "A" pump should deliver its rated capacity at 150# pressure: 70% of rated capacity at 200# pressure, and 50% of rated capacity at 250#.

Class "B" pumpers, on the other hand, are only required to pump their capacity at 120# pressure, 50% of capacity at 200# pressure and 33-1/3% of capacity at 250# pressure.

A little time is required in setting up the test.

Various size pumps require different hose layouts and size nozzle tips.

It is necessary to make adjustments between the throttle and the discharge ports in order to discharge the correct amount of water.

Refer to the Fire Engine Tests and Fire Stream Tests book as put out by the National Board of Fire Underwriters for the GPM tables and nozzle tip size.

PUTTING PUMP INTO OPERATION

The State Fire Training instructors have held many meetings to try to decide on a uniform method of operation for fire department pumper operators, knowing full well that any set of rules will have exceptions and that good pump operators may in some instances deviate from these rules in the operation of their individual pumpers. However, it was felt that a broad concept of operational procedure should be adopted. Therefore, the rules given here for putting fire pumpers into operation were designed for good pump operator habits; simple rules to avoid confusion, to bring about a better understanding of pumps and driver-operator responsibilities.

Operation Procedure for Booster Tank

1. Standard Operation Procedure for Pumping (SOP)
   a. Steps necessary before leaving cab
      1. Set emergency
      2. Shift into proper pump gear and lock
      3. Shift from road to pump and lock
      NOTE: On some pumpers it may be necessary to perform operation 3 before shifting into gear.

   b. Steps for operation outside cab
      1. Place wheel blocks in position
      2. Open valve from tank to pump
      3. Prime pump (explain forming of good habits)
      4. Engage pump (NOTE: This step not required for some pumpers)
      5. Setpump for series operation
      6. Advance throttle to desired pressure
      7. Open discharge lines
      8. Check water and pump coolers and shutters
      9. Set relief valve or motor governor (unless in high pressure operation)
      NOTE: Shut down as shown on shut down check sheet.

Operation Procedure for Hydrant

1. Standard Operation Procedure for Operating from Hydrant
   a. Steps necessary before leaving cab
      1. Set emergency
      2. Shift into proper pump gear and lock
      3. Shift from road to pump and lock
      NOTE: On some pumpers it may be necessary to perform operation 3 before shifting into gear.

   b. Steps necessary for operation outside cab
      1. Close all valves
      2. Connect to hydrant
      3. Open hydrant
      4. Check compound gauge for static pressure
      5. Prime pump
      6. Engage pump
      7. Open discharge gates
      8. Check compound gauge for flow pressure

2558

(a) Should gauge drop in pressure 10% from static reading you can take 3 times the amount of water you are now taking. Should pressure drop 20%, you can take 2 times the amount of water you are taking. Should pressure drop 30%, you can duplicate amount you are taking.

9. Set transfer valve for pressure or volume
10. Advance throttle to pressure desired
11. Set relief valve or motor governor
12. Check operation of pump and engine
    NOTE: Shut down as shown on the shut down check sheet.

Operation Procedure for Drafting

1. Standard Operation Procedure for Operating from Draft
   a. Stop and set emergency
   b. Steps for operation at draft
      1. Close all valves (Rotary gear open discharge)
      2. Connect suction and suction strainer as shown in hose manual
      3. Spot for drafting
      4. Reset emergency
      5. Shift into proper gear and lock
      6. Shift from road to pump
      7. Prime pump (watch compound gauge and pressure gauge)
      8. Engage pump (NOTE: This step not required on some pumps)
      9. Bring pressure up to 50 lbs.
      10. Open discharge gates slowly
      11. Set transfer valve to desired position
      12. Bring up to desired pressure--100 lbs. to start
      13. Set relief valve or motor governor
      14. Check list (make out check list, oil, etc.)
          Same as for all operations
          Plus compound gauge

NOTE: Shut down as shown on shut down check sheet.

2559

BOOSTER TANK OPERATION

American LaFrance Ford 750 GPM Two Stage Centrifugal Pump operates on high pressure at 500 PSI with 80 GPM.

Operating as a Booster

1. Place the pumper in position and set the hand brake.

2. Disengage the clutch, shift the road transmission to direct drive and engage the pump by moving the pump shift lever to the pumping position. Engage the clutch. Lock the road transmission and the pump transmission in these gears.

3. Open the "Tank Valve" in the line between the water tank and the pump suction.

4. Check the position of the change over valve. Some manufacturers recommend "Capacity" operation for pressures up to 210 PSI regardless of the volume of discharge. Other manufacturers state that the "Pressure" or series side of the pump should be used for deliveries of less than half the rated capacity of the unit.

   Since booster operation seldom requires a delivery of more than half the pump capacity, most departments use "Pressure" operation for Booster deliveries in order to obtain the benefit of both stages of the pump to develop pressure. In this latter operation the engine RPM is reduced with resulting less wear and tear on the motor.

5. Pull out the primer draft-hydrant valve and the primer control lever.

6. Turn the relief valve handwheel clockwise to the extent of its travel and lock it in this position.

7. Open the hand throttle until the engine speed is approximately 3800 RPM and hold this speed until the pump pressure gauge indicates a stabilized pressure of at least 40 PSI. Push in the primer controls, the draft-hydrant valve, and close the throttle.

8. Open the booster line discharge valve (hose reel valve) and open the throttle to obtain the desired discharge pressure.

9. It normally will not be necessary to set the relief valve during booster operation since the low flow through the booster hose can be shut off without serious pump pressure rise.

10. Always open the "booster line cooling valve" to prevent overheating the pump during this type of operation.

11. To shut down permanently, close the throttle, close the booster discharge valve and close the water tank valve.

Operation as a High Pressure Unit

1. Shift and lock the road transmission in "overdrive".

2. Close the relief valve hydraulic lock and proceed as outlined under "Operating as a Booster".

3. Before priming, turn the change-over valve to its "Pressure" position by turning it clockwise to the full extent of its travel.

4. Always open the "Booster Line Cooling Valve" when using a booster stream in order to prevent overheating the pump.

Comparative Engine Speeds When Operating in Pressure or Capacity
(Booster Operation)

	PSI (Pump)	RPM (Motor)
Pressure:	100 lbs.	1500
	150 lbs.	1800
	200 lbs.	2000
Capacity:	100 lbs.	2100
	150 lbs.	2500
	200 lbs.	3000

S2561

OPERATING PUMPERS FROM DRAFT

One of the chief difficulties of operating fire department pumpers is the operation of pumpers from draft. This is one of the prime responsibilities of the pump operator, as he must obtain water to his pump if he is to supply hose streams. The ability to supply these hose streams is dependent upon the knowledge that the operator has in regards to pumping water. This section will deal with the problem of supplying pumpers from draft and will give the operator information that will assist him to properly maintain water supplies for fire fighting operations.

The conditions that govern the supplying of water into the intake side of the pumper are dependent upon the type or source of water. There are three sources of water supply that are available to the pumper operator.

1. The water supply carried on the apparatus.
2. Water that is supplied under pressure from hydrant or standpipe.
3. Water that is supplied from a static source within reach of the suction hose.

The drafting of water from static sources, except for rural fire departments, is not done too frequently. However, there are problems that will arise that do not occur when taking water from the other sources. It is important that the operator of the pump become thoroughly familiar with the procedure for drafting with the particular model and type of pump which he is called upon to operate.

The ability to draft water and to deliver full performance from the pump is test of the pump itself and its operator. The drafting operation is more difficult than pumping water from a hydrant due to these factors.

1. Slight air leak may cause loss of prime.
2. Priming device is necessary as it can give trouble if not properly maintained.
3. Failure to follow a particular sequence for putting pump into operation.
4. Height of lift, the size and length of suction hose and atmospheric pressure.

Principles and Theory of Drafting

When pumping from draft we are concerned with both hydraulic and atmospheric problems. The entire operation, however, is dependent upon the 14.7 pounds of atmospheric pressure which elevates the water to our pumps after we have removed the air from inside our pumps and suction hose with our priming devices. Any fire pump, after it has been primed, is capable of supplying the desired discharge pressures, utilizing the horsepower of the motor to supply the pressures. The limiting factor of getting the water to the pump is the atmospheric pressure of 14.7 pounds. (See Fig. 18).

13[illegible]62

FIG. 18

Important to remember is the maximum distance that water can be drafted. If a priming pump could create a perfect vacuum in the pump and suction hose, a vertical lift of 33.9 ft. could be secured. However, this is impossible, and a fire pump that can "lift" water 25 ft. is considered of excellent design and condition. A more practical limiting factor is the fact that most pumpers are equipped with two 10 ft. lengths of hard suction so that 15 ft. is a more practical limitation of lift for the majority of our pumpers.

When pumping from draft -- we are aware of the fact that all pumpers that pass a Class A acceptance test are capable of providing rated capacity at 150 lbs., net pump pressure through 20 ft. of proper size suction hose at a 10 ft. lift from the surface of the water to the center of the pump. The pump can be expected to do better than this at a lower lift or, during a short spurt test, give rated capacity at 165 lbs., net pump pressure to demonstrate power reserve.

2563

Table Showing Minimum Discharge Which Should be Expected of a Pumper in Good Condition Operating at Draft at Various Lifts.

CONDITIONS: Operating at Net Pump Pressure of 150 psi; Altitude of 1000 feet; Water Temperature of 60°F; Barometric Pressure of 28.94" Hg (poor weather conditions).

Rated Capacity, Pump		500 gpm		750 gpm		1000 gpm		1250 gpm	1500 gpm		
Suction Hose Size		4"	4½"	4½"	5"	5"	6"	6"	6"	Dual 5"	Dual 6"
Lift in Feet											
4	20' Suction Hose (Two Sections)	590	660	870	945	1160	1345	1435	1735	1990	2250
6		560	630	830	905	1110	1290	1375	1660	1990	2150
8		530	595	790	860	1055	1230	1310	1575	1810	2040
10		500	560	750	820	1000	1170	1250	1500	1720	1935
12		465	520	700	770	935	1105	1175	1410	1615	1820
14		430	480	650	720	870	1045	1100	1325	1520	1710
16		390	430	585	655	790	960	1020	1225	1405	1585
18	30' Suction Hose (Three Sections)	325	370	495	560	670	835	900	1085	1240	1420
20		270	310	425	480	590	725	790	955	1110	1270
22		195	225	340	375	485	590	660	800	950	1085
24		65	70	205	235	340	400	495	590	730	835

NOTES: 1—Net pump pressure is 150 psi. Operation at a lower pressure will result in an increased discharge; operation at a higher pressure, a decreased discharge.

2—Data based on a pumper with ability to discharge rated capacity when drafting at not more than a 10-foot lift. Many pumpers will exceed this performance and therefore will discharge greater quantities than shown at all lifts.

FIG. 19

The ability of a pump to draft water decreases at higher altitudes and for all practical purposes it may be considered that the atmospheric pressure is approximately 1/2 pound less per 1,000 feet of elevation. In addition, the power generated by internal combustion engines decreases about 3.5% for each 1,000 feet elevation above sea level.

2564

If the operator can reach water with 20 feet of suction hose (properly immersed) there is usually no difficulty in pumping rated capacity, provided the pump and motor are in fairly good condition. If water cannot be reached with 20 feet of suction hose, either because of the vertical lift or horizontal distance, we have a different problem. First, we know that with a given flow we will have about 50% more friction loss through the 30 feet of suction hose of the same size. This can be observed by watching the suction gauge while drafting. The increase in friction loss may not be a major factor where the lift is below 8 or 10 feet because there will still be better than 10 pounds of atmospheric pressure left (near sea level) to overcome losses in the hose and the increased friction loss in the extra 10 feet of suction hose.

However, when the height of lift exceeds 10 feet, the amount of water that a pump can lift is cut drastically. Accordingly, if the lift is above 10 feet and it is necessary to use 30 feet of suction hose, it is best to conclude that the pump may not be able to deliver its rated capacity. As the lift increases, more of the atmospheric pressure is used to overcome the elevation, just as more pressure is required to pump water up hill. Less pressure is then available to overcome friction loss in the suction hose and the loss in strainers. The only way we have of reducing the pressure loss is to increase the diameter of the suction hose just as we reduce the friction loss between the pump discharge and the nozzle by using larger hose or using siamesed lines.

At a 10 foot lift 4.33 pounds of the atmospheric pressure are used which at sea level leaves a little over 10 pounds to overcome friction and other losses on the suction side of the pump. At a 20 foot lift 8.66 pounds are lost due to lift, leaving only 6 pounds to overcome other losses.

At this point it may be well to mention that water should reach the impellers at a satisfactory rate for efficient results. If a pump is operated so that it "runs away from water", that is, at an excessive speed considering the capabilities of the suction arrangement, damage may result due to cavitation. This is a turbulence or hammering effect resulting where air cavities are formed about the impellers, resulting in vibrations, loss of efficiency and damage to the pump. Obviously, sufficient pressure is needed at the pump inlet to provide the required velocity of flow for the required volume of discharge. In general, when drafting, it is desirable to have some reserve on the suction side although there may be times when it will be desirable to draft all the water the pump can handle without damage to the pump or engine.

002565

The 4-1/2 inch suction has 26% more waterway area than the 4 inch; the 5 inch has 54% more area than the 4 inch, and 23% more than the 4-1/2 inch. Atmospheric pressure is measured in pounds per square inch. Thus, other things being equal, at given atmospheric pressure, the 4-1/2 inch suction hose provides 26% more work area for the atmospheric pressure under a given vacuum condition than with the 4 inch suction hose. The 5 inch provides almost as much again. Thus while we cannot increase the atmospheric pressure it can be made to work over a larger area through a bigger conductor which also means that because the larger suction hose holds more water we have a lower velocity and reduce the friction loss with a given flow. Nevertheless, we cannot entirely overlook the fact that smaller suction hose is easier to handle where speed would be considered of prime importance.

The use of additional lengths of suction hose for horizontal distances would be limited by the amount of suction hose available, and the factor of added friction loss plus the longer time for extraction of air when first priming the pump.

The loss of pressure in drafting (due both to elevation of the water and friction loss) can be observed by watching the suction or compound gauge on the pump inlet. With an approximate 10 foot suction lift, with the pump primed, but with no hose stream operating, it will be noted that the gauge shows a suction or vacuum reading of about 9 inches of mercury. (The suction side of the gauge is graduated in inches of mercury equivalent to 0.491 pounds feet pressure head.) This shows the loss of atmospheric pressure due to difference in elevation between the surface of the water and the pump chamber. For field practices, an inch of mercury would indicate a capacity of lifting water one foot.

As the flow increases on the discharge side, so will the pressure loss on the suction side increase. This is due to the increase in friction loss in the suction hose and fittings on the suction side of the pump. If we have sufficient flow all of the available atmospheric pressure will be used or the point of maximum capability of the pump to maintain a vacuum will be reached. For a pump in reasonably good condition this may be a vacuum of 22 inches of mercury. If a pump is drafting with a lift of 20 feet it will use about 18 inches of mercury just in overcoming elevations and will have only 4 or 5 inches left on the compound gauge to overcome friction loss.

SHUTTING DOWN

After a pumper has served its purpose of providing pressure to satisfy the hose layout needed to control a fire, a start should be made promptly to get the pumper back in service for another fire call. This should be done as rapidly as is consistent with the need for standing by against possible additional pumping service at the fire. Often, the first practice is to reduce any 2½" lines by attaching the 1½" leader lines normally used for inside service. The engine of the pumper may be idling or the pump may be maintaining 80 to 100 lbs. pressure in the lines used for overhauling. When it is certain that nothing more than a watch line is needed, the hose may be transferred to a hydrant and the pump released.

The following suggestions and precautions apply to the procedure for shutting down:

1. Lower the pressure slowly by retarding the throttle as soon as there is no further need for pump pressure. Do not suddenly increase or decrease engine speed while pumping unless the pump is equipped with a quick action type of engine governor. Even the quick action throttle is intended for emergency protection of the hose crew. Engine and pump speeds should be raised or reduced moderately.

2. If the throttle control is of the screw-in type it should be turned at a moderate pace. If it is a lever working on a quadrant, the lever should be lifted so it does not drag across the teeth of the quadrant.

3. Close the throttle so that the engine is running at a fast idle before disengaging the pump.

4. Close the discharge gates slowly after pressure has been lowered.

5. As soon as the discharge gate is closed, open the bleeder cock to drain water from the hose line.

6. Water to the cooling system should be immediately shut off.

7. Release the pressure governor controls, or reset the relief valve to normal engine house setting.

8. Refill the booster tank with water.

9. Refill the gasoline tank as soon as practical. Replace oil in the priming pump if required.

10. After pumping from the water tank, close the tank valve unless the pump is to be carried full of water.

11. Drain all valves, pump chamber and gauges promptly in cold weather.

2567

SAFE DRIVING SUGGESTIONS FOR FIRE APPARATUS

1. Do not depend on your siren for right-of-way; other emergency vehicles may also respond to alarm.

2. Have apparatus under control at all times; the apparatus and men are dependent upon you.

3. Keep to your side of the road, if possible.

4. Turn corners at "safe speed".

5. "Feel" your brakes before you need them.

6. Do not lug motor--shift down to climb hills. Shift down to descend hills but be careful not to overspeed motor.

7. Do not "jump" truck when starting and don't crowd shifting up gears when starting; give the motor a chance to acquire its RPM.

8. Getting apparatus to the fire is the "first" responsibility. Speed is secondary.

9. Don't attempt to shift gears to reverse direction while apparatus is moving. Remember the weight.

10. Fire apparatus is an emergency vehicle only when responding to an alarm. When returning to station observe all traffic rules.

THINGS TO WATCH WHILE "OPERATING PUMP AT FIRES"

1. Temperatures--Engine, Pump, Transmission, Exhaust.
2. Gauges--Oil, Ammeter, Pressure, Vacuum, Tachometer, Fuel and Water.
3. Fuel--Oil. (Quantity)
4. Leaks--Water, Oil, Grease, Fuel, Exhaust, Suction.
5. Batteries--Keep water in Batteries; watch overheating.
6. Check water level in Booster Tank. (Replenish supply if possible)
7. Make sure "all" equipment is on apparatus and properly secured before leaving the fire.

APPARATUS CHECK ON "RETURN TO QUARTERS"

(Use Regular System of Checking)

VEHICLE

1. Replenish Fuel, Oil and Water
2. Battery (Recharge if under 1,250)
3. Lights and Switches
4. Fan Belt
5. Tires

EQUIPMENT

1. Fill booster tank and P can
2. Hose
3. First Aid Appliances
4. Service Respiratory Protective Devices
5. Salvage equipment and tools

PUMP

1. Primer Tank
2. Lubrication--Valves, Oil Level, Bearings, Packing
3. Drains (When used)

REMARKS:

Apparatus O.K. for service

SERVICE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	REMEDY
PUMP FAILS TO PRIME OR LOSES PRIME	Air Leaks	Clean and tighten all suction connnections. Make sure suction hoses and gaskets are in good condition. Use the following procedure to locate air leaks: 1. Connect suction hose to pump and attach suction cap to intake end of hose. 2. Close all pump openings. 3. Open priming valve and operate primer until vacuum gauge indicates 20 to 22 inches H. G. (If primer fails to draw specified vacuum, it may be defective or leaks are too large for primer to handle.) 4. Close priming valve and shut off primer. If vacuum drops to less than 12 inches H. G. in ten minutes, serious air leaks are indicated. With engine stopped, air leaks are frequently audible. 5. If leaks cannot be heard, apply engine oil to suspected points and watch for break in film or oil being drawn into pump. 6. Connect suction hose to hydrant or auxiliary pump. Open one discharge valve and run in water until pump is completely filled and all air expelled. Close discharge valves, apply pressure to system and wateh for leaks. A pressure of 100 PSI is sufficient. DO NOT EXCEED RECOMMENDED PRESSURES.
	Dirt on Suction Strainer	Remove all leaves, dirt, and other foreign material from suction strainer. When drafting from shallow water source with mud, sand, or gravel bottom, protect suction strainer in one of the following ways:

87 2569 0025

SERVICE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	REMEDY
PUMP FAILS TO PRIME OR LOSES PRIME (Contd)	Dirt on Suction Strainer (Contd)	1. Suspend suction strainer from a log or other floating object to keep it off bottom. Anchor float to prevent it from drifting into shallow water. 2. Remove top from a barrel. Sink barrel so open end is below water surface. Place suction strainer inside barrel. 3. Make a suction box, using fine-mesh screen. Place suction strainer inside box.
	No oil in priming tank	With rotary primer oil is required to maintain tight rotor seal. Check priming tank oil supply and replenish, if necessary.
	Defective Priming Gear Valve	A worn or damaged priming valve may leak and cause pump to lose prime. Consult primer instructions for priming valve repairs.
	Improper Clearance in Rotary Primer	After prolonged service, wear may increase primer clearance and reduce efficiency. Refer to primer instruction for adjusting primer clearance.
	Engine Speed Too Low	Refer to instructions supplied with primer for correct priming speeds. Speeds much higher than those recommended do not accelerate priming and may actually damage priming pump.
	Excess Carbon on Exhaust Primer Valve Seats	Refer to exhaust primer instructions for methods of carbon removal.

08570

SERVICE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	REMEDY
PUMP FAILS TO PRIME OR LOSES PRIME (Contd)	Suction Lifts Too High	Do not attempt lifts exceeding 22 feet except at low altitudes and with equipment in new condition.
	End of Suction Hose Not Deep Enough	Although suction hose might be immersed enough for priming, pumping large volumes of water may produce whirlpools, which will allow air to be drawn into suction hose. Whenever possible, place end of suction hose at least two feet below water surface.
	High Point in Suction Line	If possible, avoid placing any part of suction hose higher than pump suction inlet. If high point cannot be prevented, close discharge valve as soon as pressure drops, and reprime. This procedure will usually eliminate air pockets in suction line, but it may have to be repeated several times.
	Primer Not Operated Long Enough	Refer to instructions supplied with primer for required priming time. The maximum time for priming should not exceed one-half minute for lifts up to 10 feet.
ENGINE WILL NOT DELIVER CAPACITY A. Engine and Pump Speed Too Low at Full Throttle	Insufficient Engine Power	Engine requires maintenance. Check engine in accordance with manufacturer's instructions supplied with truck.
		Engine operated at high altitudes. Engine power decreases about 3% for every 1000 Ft. increase in altitude above sea level. Adjusting carburetor or changing carburetor jets may improve engine performance. Consult engine manufacturer's instructions.
	Relief Valve Set Improperly	If relief valve is set to relieve below desired operating pressure, water will by-pass and reduce capacity. Adjust relief valve in accordance with manufacturer's instructions.

2571

SERVICE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	REMEDY
ENGINE WILL NOT DELIVER CAPACITY (Contd) A. Contd.	Transfer Valve Set Improperly	Does not apply to single-stage pumps. Place transfer valve in VOLUME (Parallel) position when pumping more than 2/3 rated capacity. For high pressures, turn transfer valve to PRESSURE (Series) position.
		When shifting transfer valve, make sure it travels all the way into new position. Failure of transfer valve to move completely into new position will seriously impair pump efficiency.
	Truck Transmission in Too High a Gear	Consult vehicle instruction for correct pumping gear. Pump usually works best with transmission in direct drive. If truck is equipped with an automatic transmission, be sure to lock into pumping gear.
	Pump Wear Rings Badly Worn	Failure of pump to deliver rated capacity and pressure may be an indication that pump wear rings are badly worn. Excessive wear will allow severe internal leakage from the pressure side of the pump back to suction and reduce net pump capacity.
B. Engine and Pump Speed Higher than Necessary for Desired Pressure and Volume	Suction strainer, Suction Screens, or Impeller Vanes Fouled With Debris	Remove suction strainer and hose and clear away all debris. Pressure backwash will usually clear impeller vanes when pump is stopped.
	Suction Hose Defective	On old suction hoses, the inner liner sometimes becomes so rough it causes enough friction loss to prevent pump from drawing capacity. Sometimes the liner will separate from the outer wall and collapse when drafting. It is usually impossible to detect liner collapse, even with a light. Try drafting with a new suction hose; if pump then delivers capacity, it may be assumed that previous hose was defective.

85172 90 1425

SERVICE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	REMEDY
ENGINE WILL NOT DELIVER CAPACITY (Contd) B. Contd.	Suction Hose Too Small	When pumping at higher-than-normal lifts, or at high altitudes, use a larger suction hose.
	Truck Transmission in Too Low a Gear	Consult vehicle instructions for correct pumping gear. Pump usually works best with transmission in direct drive.
PUMP WILL NOT DEVELOP SUFFICIENT PRESSURE		In general the above remedies for low pump capacity will also correct low pump pressure. In addition, check the following possibilities.
	Pump Speed Too Low	Check pump speed with a tachometer. If pump speed is too low, refer to engine manufacturer's instructions for method of adjusting engine speed governor.
	Pump Capacity Limits Pump Pressure	Do not attempt to pump greater volume of water at the desired pressure than the pump is designed to handle. Exceeding pump capacity will reduce pressure in an inverse ratio. Exceeding maximum recommended pump speed will produce cavitation and seriously impair pump efficiency.

16 8573

WATER FLOW DIAGRAM

PARALLEL (Volume)

Each impeller pumps half of the total volume being delivered. Each impeller develops the same pressure. The transfer valve routes water from the first stage impeller directly to the pump discharge.

HIGH PRESSURE

INTERMEDIATE PRESSURE

SUCTION

SERIES (Pressure)

Each impeller pumps all of the total volume being delivered. Each impeller develops half of the total pump pressure. The transfer valve routes water from the first stage impeller to the second stage suction. Suction flap valves are closed by this pressure.

At a constant impeller shaft speed, where changing from parallel to series operation, pressure is doubled and volume halved.

2574

FIRE SERVICE LADDERS

Ground Ladders

One of the most important tools for fire department use is the ground ladder. By ground ladder we mean those ladders specially designed for use by the fire department and those not raised by mechanical means such as the aerial.

It is most important that firemen understand the purposes of ground ladders, their use and limitations.

Ladders, as other equipment used by the fireman, must be ready for use at a moment's notice. Therefore, it is important to the fireman that he examine his ladders thoroughly and often to see that all parts are in good working order and that they are safe for use. He must train often on them so that he will understand proper placement of the ladders to take full advantage of their construction features and to have confidence in their use both for fire fighting and rescue work.

Failure of the fireman to make the proper selection and placement of the ladder could result in additional danger to those being rescued or in their not being rescued at all.

As a fireman, you should know the best methods for using your ladders below ground level, as bridges for crossing from building to building, as a rescue tool and how to use them in fire fighting.

Through continued use and drills you will be able to overcome any fear of height that you might have.

American Insurance Association - Requirements

Fire departments, as you know, are graded by both the American Insurance Association and the Pacific Rating Bureau. These organizations have developed requirements for fire department ladders which are based upon the following:

> Where a ladder company is not required in cities having less than five buildings of three stories or higher, ladder equipment must be provided on other apparatus capable of reaching the roof of buildings.
>
> An aerial ladder must be provided in a district where five buildings are four stories or higher and one ladder truck in every five required shall be aerial.

As we are not concerned with aerial ladders for this class, we shall only list those ladders required for other fire apparatus.

2575

Ground ladders required for ladder truck:

A. 50 ft. extension
B. Two 35 ft. extensions
C. 20 ft. roofer
D. 16 ft. roofer
E. 28 ft. extensions
F. 14 ft. roofer
G. 10 ft. folding

Ground ladders required for pumpers:

A. 14 ft. roofer
B. 24 ft. extension unless otherwise specified by A.I.A. or Rating Bureau.

It is recommended that pumpers also carry the folding ladder for use inside buildings.

Ground ladders for tankers:

A. 12 ft. folding or straight ladder.

Grades of Ladders

There are many types and grades of ladders. All too often in writing fire apparatus specifications the type and grade of ladder is left undetermined and we do not get the type ladder most suited for our particular needs. The type and grade of ladder you wish should be spelled out through your ladder specifications. There are industrial ladders not suited for fire department use on many fire trucks. You should determine and order one of the two or more grades of fire department ladders. When writing specifications for fire apparatus, ladder catalogs may be obtained from all companies.

Construction of Ladders

The fireman should thoroughly understand the construction of fire department ladders. There are many various woods, metal and wood covered fiber glass ladders in use today. In order to determine the kind and type you wish to use we will cover some of the materials used.

Early fire department ladders were of carefully selected air-dried fir lumber in which consideration was given to ring count and grain texture. Rungs of these ladders were either hickory or white ash also carefully selected. Cost and lack of quality fir has allowed for a lesser quality of ladder construction in wooden ladders. Today's wooden ladders, however, are still built of a high grade carefully selected air-dried fir for beams and good grade hickory or white ash for the rungs. Some ladders today are also using high grades of spruce for their beams or rails.

The wooden ladder is fast being replaced with metal ladders of aluminum alloy and in many instances for aerial ladders of stainless steel or steel. The aluminum ladder is popular because of its light weight which allows for ease of handling and low cost of maintenance and repair.

Following is a list of some of the types of ladders in use by fire departments that are constructed either of wood, metal or wood covered fiber glass.

1. Folding or collapsible (See Figure 1)

Figure 1

2. Baby extension
3. Wall or straight (See Figures 2 and 3)

The wall or straight
trussed beam ladder.

Solid beam wall
or straight ladder.

Figure 2

Figure 3

2580

Nomenclature

All firemen should know the parts of a ladder so that they can understand ladder commands and so that they are better able to make visual as well as other inspection of the ladder.

Listed below are the parts found in most ladders using the proper terminology for each part:

1. Ladder beams
   These are sometimes referred to as side rails. However, the correct terminology is Beams. You will find two main types in wooden ladders--the solid and trussed beam as shown in Figures 5 and 8. In metal ladders this can vary somewhat, however, they too are also in the solid and trussed, the difference being in the individual manufacturers method of constructing the trussed beam of the ladder. (See Figures 9 and 10)

2. Rungs
   Rungs, of course, are self-explanatory and in most instances are spaced 14 inches apart.

3. Heel plates
   The heel plates are those metal plates upon which the bottom part of the bed ladder sits on when raised. (These are not known as spurs.)

4. Pawls or dogs
   In the fly section of extension ladders is a device which is spring actuated and comes out to hook over the rung of the ladder holding the fly in place so that it will not slide down the ladder. Thus we get the term "dogging the fly".

5. Halyard
   Any rope or line used to raise the fly.

6. Stops
   These are found at the bottom and top of bed ladders and second or third section fly which stop the fly ladders from coming out of the guides and prevents overextending ladders.

7. Guides
   These are found on bed ladders and allow the fly to ride in a groove within the bed ladder. (See Figure 11)

8. Truss blocks
   Used to separate the top and bottom beams.

9. Beam bolts
   Use to tie the top and bottom beams together usually through the truss block only found on wooden ladders.

10. Tie rods
    These also are usually only found on wooden ladders running from beam to beam beneath the rungs thus holding the ladder together.

2581

Figure 11

Shows the guides in which the fly ladders ride.

11. Braces
Sometimes small metal pieces are used to assist in supporting the rungs on the beams; they are always used on pompier ladders for supporting rungs.

12. Hooks
There are two types of hooks firemen are concerned with in regards to ladders--those found on pompiers and those on roof ladders. Those found on pompiers are used through the windows and rest upon the window sill. Those on roofers are used to hook over the peak of the roof to keep ladder from slipping off. There are, however, other uses for the hooks on roofers to allow a more versatile use of this type of ladder.

13. Tormenters
These are poles used on bangor ladders which will assist in raising the ladder and are set at right angles to prevent side sway. They should never be used as supports for the ladder itself.

14. Swivel
This is the connecting device to which the tormenter is attached to the beam of the bangor ladder.

38 OF 327

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

15. Spikes
These are the metal ends of the tormenter of the bangor ladder.

16. Pulleys
Are found on the bed ladders and are the devices through which the halyard runs.

17. Bed ladder
The main ladder upon which the fly ladder rests and which is always the bottom ladder when the complete ladder is raised.

18. Fly ladder
The fly ladder is that ladder which rests upon the bed ladder and is raised to make an extension of the ladder.

Inspecting the Ladder

All ladders regardless of use must be checked thoroughly after each time they are used and at least once each month. Careful records should be kept when they have been inspected and if any repairs are made and what they were. In checking wooden ladders look for the following:

1. Rungs
   a. looseness
   b. wear
   c. slivers
   d. checks or cracks
   e. dry rot
   f. paint and varnish

2. Beams
   a. slivers
   b. checks or cracks
   c. dry rot
   d. condition of varnish or paint
   e. warping
   f. tie rods and beam bolts

3. Heel plates
   a. defects in metal parts
   b. dullness
   c. cracked parts

4. Halyards
   a. dry rot
   b. weak spots
   c. frayed or worn spots

5. Pulleys and locks
   a. breakage
   b. wear
   c. lubrication
   d. check springs, etc.

2583

6. Bolts (tie and beam)
   a. tightness
   b. burns or sharp edges

7. Guides for fly
   a. condition (Does fly slide easily. If not, use paraffin on parts that rub together.)

Consider the following items after inspection: Does ladder need revarnishing? Has the top of the ladder been painted white or the bottom black? If not, they should be painted for identification during use.

Ladders must be kept clean and should be washed at least once a month with lukewarm water so that the moisture content of wooden ladders is maintained.

When replacing the halyard be sure to splice; do not tie knots in these lines.

Further inspection of metal ladders requires that you check the following:

1. Rungs
   a. welds
   b. damaged or weakness caused by overloading or banging against a building
   c. looseness
   d. cracks, etc.

2. Beams
   a. welds, rivets and bolts
   b. signs of strain or metal fatigue
   c. deformed from heat or overloading

3. Halyards
   a. same as for wood if rope
   b. cable halyards check for fraying or breaking

Ladder Commands

It is necessary that all crews handling ladders work together as a team. Failure to do so will only result in confusion with the possibility of members of the fire department becoming injured or killed.

Ladder commands must be obeyed; therefore, it is necessary that a level-headed officer or leading fireman take charge of the crews. This in most cases should be an officer well trained in the use of ground ladders.

Commands for operations should begin upon the removal of the ladder from the apparatus and continue until it is replaced.

It is important that all commands be loud and clear.

Remember the person in command will be responsible for choosing the ladder to be used and its placement on the scene.

He is also responsible for the safety of the crew working with him and should always give thought to watching for holes in the ground that crew members might step in, fences, wires, cornices, hose streams, condition of building, etc.

The following ladder commands should be used at all times either on the drill ground or at the fire or rescue scene:

1. Prepare to remove ladder from apparatus
   a. men should assume positions to remove ladder
   b. unlock ladder
   c. remove from rig

2. Prepare to carry
   a. ladder is placed in carrying position with all members ready to go in the same direction

3. Carry
   a. ladder is in carrying position and on way to place it is to be used

4. Lower ladder
   a. ladder is lowered in preparation for raising

Selecting the Proper Ladder

The selecting of the proper ladder for doing a particular job is the responsibility of all firemen. Only in paid departments is this responsibility handled by an officer. In the volunteer department all too often the selection of a ladder or ladders rests upon any available fireman. It is important, therefore, that during drill sessions all firemen have some responsibility for selecting the ladder for a particular job.

Therefore, in determining this selection of a ladder one should give consideration to what he is going to do with the ladder. Here are some uses that ladders may be put to:

2585

1. Bridging
   a. from one building to another
   b. across holes in floors
   c. to run hose lines over streets, etc.

2. As a battering ram

3. As a framework for a drafting basin

4. As a pry for lifting heavy objects

5. As a platform for a rescue on thin ice or mud

6. As a rack for placing hard suction in water to keep the strainer off the bottom

7. To extend hose line to upper floors

8. For making rescue on upper floors

9. For use inside buildings for reaching fires in hard-to-get places

10. For reaching persons in areas below ground level such as caveins, etc.

In selecting a ladder to reach upper floors it is well for the fireman to remember these simple suggestions or rules:

1. Average distance of one story in height is 12 ft.
   Example: A three-story building would be 36 ft. to the ceiling of the third floor.

2. Average distance from window ledge to floor is three feet.
   Example: Two-story building: to reach second floor window height of ladder needed would be 12 ft. for first floor plus 3 ft. to window ledge or 15 ft.

It is important, therefore, in selecting a ladder to reach a certain height that we are able to make a rapid estimate of the height and select the proper ladder to reach this height allowing for enough length so that the ladder will extend two rungs over the window sill or over the top of the cornice.

Ladder Loading

There is a simple rule for determining the allowable ladder load. Use the first number of the length of ladder and this will give you a rule of thumb.

For determining ladder load:

1.	14 ft.	1 man
2.	24 ft.	2 men
3.	35 ft.	3 men
4.	45 ft.	4 men

Figure 16

Shows how to determine selection of roof ladder.

2587

Ladder Loading, contd.

To maintain proper load when climbing a ladder it is recommended that the firemen space themselves at least 10 feet apart on the ladder.

Placing Ladders

The placing of the ground ladder must be given careful thought and consideration. The person in charge should have had many hours of drill and experience in using ladders so that he may determine the placement of the ladder giving consideration to what it is to be used for. He shall have to quickly estimate distances so that very little adjustment will be necessary once the ladder has been raised. He shall be responsible for placement of the heel of the ladder for proper climbing position. He must watch for overhanging wires, trees, cornices and any other obstacle that could interfere with the safety of the men raising or working from the ladder.

Many ladder placements can be pre-determined by the fire department's pre-plan.

Judging Distance for Placement of Ladder

One of the most important steps is the placement of the heel of the ladder if we are to have:

1. Proper climbing stance (See Figure 20)
2. Even distribution of weight when climbing
3. Speed and ease in raising

You must give consideration to these factors also in placement of the ladders:

1. Overhang of cornice and eaves
2. Length of ladder to be used

A simple formula for determining placement of the heel of the ladder is: Use 1/4 the length of the ladder for placing heel of ladder from the building adding any overhang such as cornice or eaves.
Example: Placing a 24 ft. extension ladder into a window 1/4 length of ladder is 6 ft. place heel 6 ft. from wall for proper placement. (See Figure 17 for proper angle of ladder)

You must, of course, give consideration to other factors in placement of your ladder. One is the terrain upon which the ladder is placed. Uneven sloping or soft ground must be allowed for. Some fire departments have ladders equipped with a ladder leveler; others must improvise to level the ladder by using blocks of wood. As this leveling of a ladder at its best is an unsafe practice, great care must be taken when it becomes necessary to block up a ladder so that it is level. In all cases a tie-in hook must be used to tie the top of the ladder in position.

It is recommended that whenever the terrain upon which the ladder is placed is not safe, constant heeling must be kept to prevent the ladder from slipping.

Use extreme care when placing the ladder on ice, asphalt, concrete and soft ground.

2588

Improper angle
Loads tend to deflect beams

Proper angle
Beams support load

1 to 4 or 75°

Figure 17

2589

Figure 18

Shows correct way to quickly determine if ladder is at the proper angle for climbing. Place toes against heel of ladder, stretch arms out standing perfectly straight and if you can touch beams with finger tips, the ladder is in proper position for climbing.

2590

Raising Ladders

It is important that firemen train often in the use of ladders in order that when they are used on the fire scene all members of the department are able to effectively work together as a team.

Some of the raises that are required for fire and rescue operation are:

1. Shooting of the ladder
2. The beam raise
3. The flat raise
4. The hotel raise
5. The auditorium raise
6. Bridging

In raising ladders after proper selection and placement of heel, the firemen who are to raise the ladder should face each other across from each other. Adjustments must be made if one fireman is taller than the other. Figure 19 shows this proper position. Picking of the ladder from the ground must be done with the back muscles and legs keeping the back straight. Lifting this way will prevent any injury to the back. The ladder must be heeled at all times during raising operation and great care should be given to see that proper position for the heeling of the ladder be maintained during raising operations.

Figure 19

2591

Climbing the Ladder

In climbing ladders the fireman should climb on the instep of his foot so that the heel of his boot comes in contact with the rung of the ladder. He should climb with his back straight and arms extended as shown in Figure 20.

Figure 20

Tieing In

To tie yourself in on a ladder you put one leg between the rungs allowing the leg to come into contact on the back of the knee then hook the toe of the boot either over the beam of the ladder or over the rung below that rung the inside of the knee rests on.

Use the leg to tie in with opposite the side you wish to work on.

Figure 21

Shows proper tieing in on a ladder.

FORCIBLE ENTRY WITH SMALL TOOLS

Introduction

Somehow it is the habit of fires to start in some out-of-the-way place in a building, and apparently in the most unsuspected places. Because of this fact, fires, when discovered in the early stage, nearly always are inaccessible and forcible means must be used to reach them.

If you just stop and think of some of the common fires, discovered in the first stage, you will realize the meaning of this fireman's term "Forcible Entry." Many fires occur in locked buildings and when the occupants are away from home. The attic fire, for instance, usually requires the roof to be opened up and this must be done by force.

Rescue work, in many instances, calls for forcible entry. Children have a habit of locking themselves in bathrooms, and people overcome by asphyxiation many times are in locked rooms.

The very purpose of locks and inside fasteners, that of the protection of property, becoms a hindrance to the purpose of the Fire Department, that of the protection of life and property, and the protection device must be overcome by forcible entry methods.

Forcible entry, to the fire service, means the opening of doors, windows, roofs, floors, skylights, partitions, walls, etc, by mechanical means. To make such operations possible, tools for this purpose have been devised. Such tools are peculiar to the fire service and are designed for emergency operations. In fact, firemen themselves have made many suggestions and have actually designed these tools to fit their particular need.

Take, for instance, the fire axe as we know it today. It is not the common everyday type of axe that is found for sale, and for use by the average individual. This most important tool is properly called the "fireman's best friend," the pick-headed axe. Its one great advantage over a common axe is the pick on the back of the head. This is used to pull up flooring and roof boards, to remove partitions, and even for pulling lath and plaster in places inaccessible to pike poles. If it were used exclusively for cutting wood free from materials harmful to the blade, a wood chopper's axe would be ideal. However, the many requirements and severe service expected of a fire axe, such as all kinds of prying as well as cutting, make it advisable to have a pick-headed axe. If its blade is extremely sharp and body is ground too thin, pieces of the blade will be broken out when cutting gravel roofs or striking nails and other materials in flooring. If the body is too thick, regardless of the sharpness of the blade, the axe cannot be driven through ordinary flooring. Medium thickness of the body is necessary, the thickness depending upon the grade of steel being used and the experience of the operator. The temper should be such that the blade will not bend easily or break off when nails, gravel, or other foreign matter is struck with the axe.

Thickness should be: 1/4" at 3/4" back from edge, 3/8" at 1-1/4" back from edge and 1/2" at 2" back from edge. (Measure at center of blade.)

The axe should weigh from 5 to 8 pounds. The handle of the axe is left rather thick to prevent breaking should the axe be driven through a floor unexpectedly.

GCCS

2594

The grip is thin to provide elasticity and should be smoothed to a polish. Paint or varnish should not be used, but a coat of boiled linseed oil may be used to exclude roughness and warping. The length of the handle is not necessary for the chopping action but is there primarily for leverage in prying.

When cutting with a fire axe, the axe should not be swung as a wood-cutter uses it, but it is used with short, quick strokes. Choke up a little on grip. Using this method, all danger of hitting the other men, catching the axe on overhead obstructions, etc., will be avoided, and the axe will be under complete control at all times.

When cutting flooring, roofing, or sheeting, the cut should be made at an angle to the grain of the wood, instead of straight across it. About a 60-degree angle is correct.

When cutting diagonal sheeting, it should be done, wherever possible, in the direction toward which the sheeting runs, so that the chips will have a tendency to split out as the cut is made.

Wherever possible, cutting should be done across the grain of the board instead of straight down. Also, cut as close to a joist or stud as possible.

FORCIBLE ENTRY METHODS

Suggested methods for opening the following, in respect to Forcible Entry:

Solid Core Door: A solid core door in a wood jamb, frame building, may be opened or forced inward by using a kelly tool, Hux bar, Halligan tool, door opener, an axe, etc., by spreading the door at the lock, away from the jamb and pushing inward.

Plate Glass Door: A plate glass door with wood stile and in a wood jamb, may be opened in the same manner as you would a solid core door if it is not fit too tightly in the jamb. If much forcing is necessary, it would be wise to break the glass for entry as there is a good possibility that it will be broken anyway with the forcing.

2 x 4 Bar Lock: This type of door is usually found to be of a double door type and swinging inward. It may be possible to put the blade of a saw between the two doors and cut or lift the 2 x 4 in the center, then either door should be free to swing open.

Door and Transom: A door and transom combination often affords entry by taking advantage of gaining entry thru the transom rather than forcing the door in cases that would warrant the time for such an operation. Glass in the transom may be broken, cleaned out around the frame, then lower a man down inside the room to open the door from the inside.

Padlock and Hasp: The pick head part of the firemen's axe is used to good advantage here to pop the staple free of the hasp by inserting it in back of the hasp or in the opening of the staple and forcing it outward. Other means of entry would be to turn the padlock over on the staple and strike it a sharp blow to break it or to use a bolt cutter on the staple itself.

Tumbler Lock: A tumbler lock presents a situation that is only met successfully with a special lock picking tool designed especially for such an occasion. It is inserted into the lock and the trigger is pulled. This is a universal tool that meets the occasion for all locks, causing the tumblers to line up in such a position that the tool may then be turned in the same manner as the key would be, thereby affording entry.

Crank Lock on Windows: Not much advantage, if any, is gained here in trying to force the window in a conventional manner, as extensive damage to the frame will be caused needlessly. Break the glass, clean out around the frame and reach through to turn crank for entry after lock has been freed.

Panic Hardware: Panic hardware presents a difficulty in that the normal means of fastening such a door is disregarded in favor of pawls in both the threshold and horizontal part of the door jamb. Unless glass may be broken in the door or other means of entry may be found, the only solution would be to bore or cut a hole in the door some 36" above the threshold, then reach into the opening and trip the panic bar.

Window with sash and twist lock: If this is a double run conventional type of window in a wooden frame, the blade of the axe should be inserted under the bottom sash, between it and the sill, and in direct line with the lock. Twisting the axe will force the window upward and spring the screws free of the lock.

10

Metal Overhead Rolling Door: This type of door presents perhaps the most difficult type of door to force open. It is usually found in storage warehouses and places that require that extra ounce of protection from outside entry. The key to opening such a door successfully lies in the release of a chain from its pawl on the jamb of the door, that drives an overhead gear mechanism for raising of the door. The normal position for securing such a chain is approximately 40" above the threshold or floor on the left or right door jamb. (Prefire survey should be most helpful here.) If there is a tell-tale mark or colon on this spot, then entry can be made by cutting through the door here with a cutting torch which will allow the fireman to reach into the area to release the chain, then a bar under the door may be used to force it upward without the mechanical advantage of the gear mechanism being used.

Crawford Type Door: The Crawford type door, usually found in private dwellings consists of may small panels or a panel and glass combination. It is locked by means of a bar or rod running from the lock mechanism to the nearest outside rail. The best and fastest method for entry would be to break a glass near the lock (panel nearest the lock if no glass appears) then reach through, trip the lock, turn handle to open door.

Cement Block Wall: Cement blocks are usually made in two or three-sectioned, hollow core style. In breaching this type of wall, knock out the center section of one block, then work to the outside in much the same manner as you would with a brick wall. Use a heavy mall or the round end of a battering ram for the initial block, then work on the others with the pointed or prong end of the ram or pick part of the axe or hammerhead pick to free succeeding blocks.

Tempered Glass Door: Other means of entry should be explored before using such a door as this for entry into a building, due to the cost of replacement of such a door and the sometimes difficult time in breaking through it. It may be broken by using a Carbon Dioxide fire extinguisher on it for a short period of time, discharging the extinguisher at one corner of the door, then striking it with the pick part of the axe. This type of door has no stile or header rails. It is locked at the threshold. It can never be forced in the usual manner.

2596

FORCIBLE ENTRY TOOLS

Axe: The number one tool for forcible entry. The pick head axe cuts almost as well as the flat head axe, and when the pick is used, it becomes a very good digging and prying tool. The blade may also be used for prying operations using the handle as a lever.

Battering Ram: Its use is for breaching walls and for forcing solid doors. When used on brick walls, the fork end of the ram is used and should be raised just before striking the wall so that a lifting motion is caused at the striking point. For forcing doors, the butt or round end is driven against the door just below the lock on the solid portion of the door (stile,) not against the panel.

Bolt Cutters: Their use is for cutting soft steel, iron bolts, padlocks that DO NOT have tempered steel, and cables of greater size than could fit into the jaws of a cable cutter.

Cable Cutter: A special tool designed for the express purpose of cutting cable. It should not be used for any other purpose. It is designed with a guide so that the material to be cut is held in square alignment with the cutting jaws and one of the cutting jaws is designed to give a shearing action across the cable being cut.

2597

Crow Bar: A long straight bar with a chisel-like point on one end, used for prying heavy planking and flooring; to open heavy or stongly bolted doors; and any other type of heavy requiring leverage.

Wrecking Bar: A bar with curved end for offset work, and a nearly straight, chisel-like reverse end, used for breaking locks, opening doors, forcing window, lifting iron shutters, prying up rolling doors, and other uses where a prying action is needed.

Door Opener: A special tool designed for forcing doors inward. It may also be used as an emergency hose clamp. It has an adjustable arm to fit various heights and is designed is such a way as to give great mechanical advantage to the user. It may also be used as a crowbar.

Sledge Mall: An extra heavy hammer-like tool commonly found in 8, 10, and 12 pound sizes, having a handle about the same length as the fireman's axe. It is used for breaking objects such as deadlights, concrete, tile, walls, floors, roofs, locks, and for bending iron bars or grating.

ccds

2598

Pick Mall: A tool that incorporates the advantage of both a light sledge and a pick. It may be used in various types of heavy prying and digging operations. The hammer head part of the tool makes it possible for a sledge to be used in combination with it.

Pike Pole: A wooden pole in lengths of 6', 8', 10', or longer lengths with a metal tip used for removing lath from plaster walls and ceilings; corrugated iron walls and roofs; and for pulling down metal ceilings. It may also be used in breaking windows or opening them in hard-to-reach places.

Floor Saw: A hand saw having a convex cutting edge, used for making starting cuts in flooring, walls, and the like.

Wire Cutters: A cutting tool shorter in length and size than a bolt cutter, yet similar in design. It is equipped with a guide for aligning wire into its jaws. It also has soft rubber insulation on the handles. Its jaws are of a softer material so it should never be used on any material other than copper wire.

The Halligan Tool: This tool is designed for use in opening doors, locks, floors, baseboards, trim windows and is desinged for use as a prying tool. A sledge hammer and the pick part can be used for opening walls, etc.

The Hux Bar: This tool may be used for opening doors and windows and is also designed for shutting off gas meters.

The Roof Cutter: A tool designed for opening metal roofs works much the same as a can opener; very effective for fast opening of metal roofs.

Chisel: Various types include the cold chisel, diamond point, and the punch. They are used in cases where it is necessary to cut metal, steel bolts, rivets or to open sidewalk elevators and the like.

Pliers: Pliers with pastic covered handles are very useful in cutting wires, and have many other uses.

2600

FORCIBLE ENTRY WITH POWER TOOLS

Introduction

Through the years whenever it has been necessary to force entry into a building, vehicle, or aircraft for the purpose of fire extinguishment or rescue, most of the work has been done manually with axes, bars, battering rams, or special tools that required a great deal of effort by the fireman. This type of work often results in a delay in starting extinguishment on the fire as well as reducing the strength reserve of the firemen at a critical time in the operation.

Just as modern streamlined apparatus has replaced old time pumpers, power tools are now being recognized and used by many of the best rated fire departments to gain entry by force. This is especially necessary when entry must be made to permanent type buildings or those that follow the modern trend of construction with a minimum of windows and doors. The use of power tools provides entry quickly with the least amount of effort and leaves more men available to lay lines or whatever other action is necessary to handle other phases of the emergency. Every fireman should be completely familiar with power equipment at his disposal in order to get full value from it.

Power Sources: All power tools used in the field of fire fighting should be powered by units provided by the fire department as often the source of electricity to the building is already cut or in jeopardy by the time the apparatus arrives. By providing power source there is no scurry under stress or smoke conditions in an effort to find power to operate the equipment. Whatever the source of electric power, sufficient extension cord must be carried to provide access under all anticipated emergencies.

Portable generators offer the best answer to the problem as they can be set off the apparatus and used individually leaving trucks free to lay lines, hook up for pumping, etc. There are a number of highly efficient gasoline powered generators available, most of them now designed for simplicity of operation.

Heavy duty generators can also be provided on the apparatus with plug in connections to be readily available for use with the power tools.

In the absence of generators provided by the department and with power cut off at the building involved, it may be possible to draw on power from neighboring buildings. This generally is not a satisfactory method as locked doors at night may present an additional entry problem.

Porto-Power: The Porto-Power, manually operated but producing terrific power in pushing, pulling or lifting is especially adapted for use in rescue work where injured victims are pinned by fallen timbers, in vehicles, etc. This unit can be purchased to handle from four to fifty tons load. It develops its greatest power in pushing but is easily operated by one man. With proper accessories, the Porto-Power can adapt to almost any position or angle to do its work. Caution must be used in placement for use, as a slip after pressure has been applied can endanger firemen or victims being rescued. Also, care must be taken not to attempt to lift more than the weight designed for the ram as overlifiting can seriously damage the unit.

Sabre-Saw: The Sabre-Saw, which is an electrically powered heavy duty hack saw, has a special variety of uses in the field of Forcible Entry. A wide selection of quick changing blades gives it great versatility in making entry through differing types of metal, wall boards or wood construction.

00as 2601

The saw works at extremely high speed and if properly operated can make entry even on flat surfaces where no starting hole is available. This is done by starting the blade parallel with the surface and gradually cutting into the surface until the full stroke cut is obtained.

Acetylene Torch: At times it may be necessary to remove heavy metal barriers to gain entry for either rescue work or fire extingushment. To cut out metal window bars, remove heavy locking devices, cut reinforcing steel, or to enter smashed vehicles it may be necessary to use the acetylene cutting torch. Great care must be used, however, to assure against burning trapped victims in rescue work or ignition of gases or gasoline in some types of emergencies. This can be accomplished by use of an asbestos blanket or water fog screen carefully used.

Under hazardous conditions the torch should never be used until fire protection equipment is in place and ready for instant use. When used to gain entry to a building one man should be delegated to make a special check against possible accidental fire start.

A special check should be made periodically to assure that supply bottles are full and the equipment is in instant readiness for use.

Chain Saws: The most versatile of power tools is undoubtedly the chain saw. Either electrically or gasoline powered, it provides ready access through all kinds of wood and wallboard. It is particularly useful in providing entry through heavy warehouse doors, laminated types of construction and removal of heavy timbers. The chain, or cutting edge, is readily removable and a new type of chain permits cutting through a limited number of small nails without seriously damaging the cutting teeth. Most of these saws operate with a centrifugal clutch so must be operated at full throttle.

Operators of a chain saw should gain all possible experience in order to become familiar with special operational problems, how to make the approach for the cut, etc.

At all times when these saws are in use extreme care should be observed in handling them. Other firemen should be instructed to stand clear and no hasty approach should be made near the operator. During the excitement of a fire a slip could result in very serious body injury.

Pre-connected Chain on Apparatus: Of small expense when considering its value in use is a heavy duty chain pre-connected to the frame or a heavy eye bolt at front of apparatus. Slack chain approximately twenty feet in length is stored on a spindle which can be located on the front running board or on a shelf between the front bumper and the truck body. In emergency use, the spindle is lifted off and the chain pays out readily.

It can be used at a moment's notice to remove objects blocking fire access routes, gates or heavy doors that have become jammed or are locked. It is also used to remove burning vehicles to a safer position from inside or outside of exposures, provided at the front of the truck it gives the operator an opportunity to see fully what is taking place. However, care should be taken to make sure no vehicle is pulled away on a down grade as brakes may slip and the vehicle become uncontrollable.

Pre-planning Heavy Equipment: Most small fire departments and fire districts may at some time be faced with emergency situations requiring the breaching of concrete walls or floors or some situation where heavy equipment is needed.

VENTILATION

The use of ventilation as we know it today has been brought about through a study of the control of fires.

The inability of firemen to get into buildings and the explosions that have taken place because of the lack of control through ventilation have caused firemen to give considerable study to this problem. These studies have given us certain facts concerning the effect of proper ventilation of buildings.

In the study of the problem of controlling fires through the use of ventilation it should be kept in mind that the fire that will require ventilation is the one where because of excessive HEAT, GAS and SMOKE the firemen are unable to make entry and extinguish the fire. All firemen will at some time come into contact with a fire of this type.

The usual fire department definition of ventilation is "the removal of dangerous and disagreeable smoke, gases and heat and the replacement with fresh air". The purpose of ventilation is: To clear the building of smoke, gases and heat through the use of directional control so that entrance can be made and hose lines can be advanced.

There will be times that ventilation will not be necessary because of existing conditions. Caution should be used when fire fighting strategy calls for ventilation so that indiscriminate opening does not take place. It is imperative that conditions which will require ventilation of buildings are fully understood.

This class is to help you understand the need for ventilation to control fires and to use ventilation properly so that there will be less fire and water damage, eliminate the life hazard to firemen, control the fire situation to prevent backdraft explosions, mushrooming or spread of fire and to control exposure hazards.

We should keep in mind that fires can and do start in fireproof buildings. Wherever there are people, there will be fires. Conditions exist in building construction over which we do not have control and which will at some time or other cause fires to get out of control with the resultant loss of life and property.

For proper means of ventilation the following methods of operation will be explained:

1. The use of water fog to ventilate
2. Cross ventilation
3. Vertical ventilation
4. Use of mechanical methods

It is well to remember that directional control of fires should be kept in mind at all times where ventilation is used.

VENTILATION WITH WATER FOG

One of the newest methods of attack and fast becoming one of the most popular methods is the "indirect method of attack" applying the principle of extinguishment by the use of water fog.

There have been many fine results from this method of attack; however, very little study has been given to its application where ventilation is desired. To ventilate a building using water fog certain requirements are desired; without these requirements ventilation with water fog will not be effective.

Heat. First, we must have heat in the building; a temperature of not less than 600° is desirable. Water will turn to steam if the temperature is 212° or above; however, because of the rapid cooling of the atmosphere, high temperatures are desired so that a large and continuous amount of steam is generated.

Confined Fire. To be effective the fire should be confined inside the building and not ventilated; however, effective application of water fog has been attained even though the fire has vented itself.

Correct Type Application. To have an effective application fog nozzles should have between a 30 degree and 45 degree pattern and of sufficient discharge to properly cover area of fire.

To have a clear understanding of what takes place inside a building that makes the application of water fog effective let us, step by step, go through this procedure.

We know we must have heat. Assuming that we have a fire confined inside a room or building and that the temperature is above the desired 600°, we will then apply water fog to the interior from the exterior preferably through a small opening such as a window directing the fog pattern into the superheated area near the ceiling of the room rotating the nozzle rapidly in a circular manner.

Water fog upon contact with the superheated area will then turn to steam at the rate of 200 cubic feet of steam for every gallon of water that is applied to the heated area. This steam will absorb heat causing the temperature to drop. However, for the purpose of ventilation what we are interested in is the quantity of steam that is generated. When more than enough steam has been generated so that there is more steam than the area will hold, an internal pressure is built up inside the room or building greater than the outside pressure. This pressure will try to equalize with the inside pressure causing the steam to be forced from the building carrying with it the heat, gases and smoke from inside the room or building thus allowing the firemen to enter and extinguish the remaining fire.

Application of water fog should cease when steam only is excluded from the room or building involved. Continuing of application will only result in water damage.

What to Watch for When Making the Indirect Attack

1. Turbulence caused by rapid expansion of steam carrying steam to all areas of building.

2605

2. Ejection of smoke from building.
3. Ejection of smoke and steam from building.
4. Ejection of steam from building.

When nothing but steam is being ejected from building or room, the fire has been sufficiently extinguished and ventilation process is complete, shut down lines and wait for atmosphere to clear. This clearing of atmosphere inside building may be hastened by the use of conventional methods of ventilation. Entry may be made soon after atmosphere has become clear.

CROSS VENTILATION

Cross ventilation is accomplished by opening windows or any other opening that will permit the horizontal escape of smokes and gases. Because of the fact that gases stopped from rising will spread outward, opening for escape should be on the leeward or downwind side of the building. This will take advantage of wind currents in getting the heated smoke to the outside.

Modern windowless buildings are a problem as to where to ventilate because of the lack of side wall openings. This leaves only top ventilation as a possibility. Another problem structure is one covering a large ground area such as a warehouse, factory, school, supermarket, barn or church. Each of these is an individual problem that can best be evaluated by a pre-fire inspection.

VERTICAL VENTILATION

Vertical ventilation is done by making an opening above the fire to allow the smokes and gases to escape. Any permanent structural features such as skylights, ventilators, elevator shafts, penthouses or air conditioning ducts can be used effectively for rapidly making an opening. These items are part of the building and may be used because they are usually connected to the interior of the building with no intervening floor or ceiling. In addition the repair afterward will be less costly than if a hole is chopped in the roof.

When an opening must be made in the roof, care should be given to the selection of the point at which the chopping will be done. It is self-evident that the opening should permit escape of the smokes and gases by a direct route. This is not always possible because of structural features or because the escaping heat would directly expose adjoining buildings. In this case the opening is made so the heat must pass through the least part of the involved structure.

In making an opening it is important to make the area large enough to allow passage of heat and gases with little hindrance. One opening 8 feet by 8 feet is the same area as four openings each 4 feet by 4 feet, yet the cost of repair will be little more for the one large opening than for either of the smaller ones. It is a common mistake to make the opening too small.

MECHANICAL METHODS OF VENTILATION

Smoke ejectors and water streams are classed as mechanical methods of ventilation.

Fire departments are finding the use of smoke ejectors very helpful in clearing atmospheres of heat, gases and smoke from buildings. Smoke ejectors should be

2606

used to force fresh air into smoke filled areas using conventional methods of ventilation to allow smoke, heat and gases to escape. This method is by far more efficient than trying to draw the smoke from these areas.

More efficient operation can be attained using smoke ejectors for cross ventilation by using two or more ejectors, placing one on the lee side drawing smoke to it and one on the windward side forcing fresh air into the area.

Water fog and straight streams can be used effectively to force smoke, heat and gases from buildings by making openings on the lee side and advancing hose lines into area from the windward side. This method should be used only when water damage is not a problem.

ADVANTAGES FROM VENTILATION

The principal results of proper ventilation are:

1. Aids rescue by permitting firemen to gain entrance.
2. Permits quicker location of the fire.
3. Reduces fire, smoke and water damage.
4. Aids salvage and overhauling.
5. Reduces the actual time of fire fighting and equipment out of service.

Additional results are:

1. Sells the fire department to the public by quicker and more efficient fire stops.
2. Reduces operating costs by conserving manpower and equipment.

By clearing the building of smoke, hot air and dangerous gases, ventilation accomplishes these results as follows:

1. Increases visibility permitting prompt and safe entry with rapid search and faster rescues.
2. Permits the fire to show making location quicker and easier.
3. Aids the attack at the seat of the fire thereby preventing spreading; less smoke loss; less water loss.
4. Reduces possibility of back draft; allows dangerous conditions to be seen with less chance for accident.
5. Increases speed and efficiency, fire out quicker, apparatus back in service quicker, lessens work and danger to men.

Smoke is a mixture of gases and fine particles of carbon resulting from incomplete combustion. It will be noticed that large quantities of smoke occur usually at fires that are confined where sufficient oxygen for complete combustion is not present. Basement fires are usually associated with large columns of smoke. Free burning fires result in very little smoke.

What are the conditions inside a building that require ventilation? The interior is filled with smoke. Heated air and unburned gases accumulate at the top and mushroom. The temperature may be upward of 1500 degrees. If the building is of reasonably tight construction, combustion will not be complete and this results in the formation of carbon monoxide.

3039

2607

What happens when a building is ventilated? Smoke, hot air and gases are removed, pressure of expanding gases is released and mushrooming is prevented. Free burning and rapid combustion follow.

What happens when a building is not ventilated? Eventually it will ventilate itself. The hazard of a back draft is increased. Fire fighting is hindered and the resultant loss will be much greater.

BACK DRAFT

What is a Back Draft? It is an explosion caused by the admission of ordinary air, bearing oxygen, to a fire that has not been burning freely. With such a fire there is usually a large accumulation of flammable gases and the temperature well above the ignition point of these gases. When the right mixture of oxygen and gases occurs, ignition is immediate and a violent explosion may further spread the fire and cause injury to the firemen.

When to suspect a Back Draft. When a fire has been smoldering a long time or where there is a grayish hot yellow smoke, or if the smoke pours out of an opening for a time and then sucks back in.

Protection against injury. If you suspect a back draft, keep low; the explosion may pass over you. When opening up, do not stand directly in an opening; if possible, use pike poles or a long straight ladder to force doors and windows.

When to ventilate? When entrance to the building is impossible due to heat, dense smoke or dangerous gases. Wait until sufficient lines are laid and charged so that you are prepared to fight the fire. After entrance has been made ventilate only as needed.

Where to ventilate? Directly above the fire, if possible. Open elevator shafts, skylights, scuttle holes; cut holes in roof, if necessary; open windows; make openings in walls, ceilings or floors. Do not draw the fire through unaffected parts of the building. Check your wind direction and exposures to adjoining buildings.

GENERAL RULES FOR VENTILATION

Roofs. When you go to a roof to ventilate, be careful to check your way of escape. Note the direction of the wind and work with your back into it. Feel for hot spots to locate travel of fire. Make roof openings good sized. Remove skylight covers and insert a pike pole to break the lower frame which is often found at ceiling level. Investigate for false ceilings below roof openings and, if necessary, punch through it. On dwelling roofs try to cut the first hole near the ridge but not through the ridge timber. A good workmanlike job on all axe work reflects to the credit and efficiency of the fire crew. Cut through the roof boards along the rafter lines.

Windows. Do not open windows indiscriminately on all sides. Note the direction of the wind and work accordingly. Top floor windows may be opened all the way down from the top. A long ladder may be dropped against the glass when entrance to the building is not possible. A pike pole worked from the roof can be used for top floor windows. Lower floor windows are usually opened two-thirds from the top and one-third from the bottom.

2608

Basement. Basement fires are probably the most difficult to ventilate. In some cases elevator shafts can be used if the elevator is in favorable position. All exterior openings to the basement can be opened including sidewalk scuttles and deadlights, grade level entrance doors and windows. When it is impossible to make sufficient openings at front or rear, a board can be stripped from the floor above the basement. This can be done the entire length of the floor and then windows or doors both front and rear of this floor should be opened. If holes are cut in this floor, they should be near a front or rear window so as to permit the smoke to pass outside. Sometimes it is possible to speed up ventilation by concentrating several lines at the front or rear and driving the heat and smoke in the direction of openings that have been provided.

Residences. Ventilation is desirable if the building is heavily charged with smoke and fire is not in evidence. Additional ventilation is often necessary after the fire is knocked down to facilitate salvage operation and overhauling.

The Necessary Requirements for a fire department to do a first-class job of ventilation are:

1. Some knowledge of the scientific facts concerning fire particularly the travel and expansion of heated gases.

2. Good fire department discipline. The firemen must be so trained that they can work together with a minimum of supervision. There must be good teamwork between the men who lay the lines and those who do the ventilating so that all necessary preparations are made to fight the fire when it shows.

3. A thorough training in all forcible entry tools so that the results will show a workmanlike job.

4. A thorough knowledge of building construction and personal knowledge of buildings that have been rebuilt or modernized. Knowledge of items such as penthouses, skylights and parapets; exterior walls with openings, attachments and offsets; party walls; interior walls; partitions; fire curtains; vertical openings such as stairs, elevator shafts, dumb waiters; air shafts; light wells, etc. Also horizontal openings such as doors, windows, chutes, belt holes, etc.

5. A general knowledge of the type of occupancy and the nature of the contents.

The Hazards Involved in ventilation are:

1. Opening below the fire too soon.
2. Life hazard to firemen.
3. Spreading of fire by improper methods of ventilation.
4. Involvement of exposed buildings.

The Warnings to be Stressed in connection with ventilation are:

1. The ventilation should not proceed beyond the preparation stage until lines are charged and ready.

8085 2609

2. Do not ventilate when it may involve exposed property until steps have been taken to protect such property.
3. Do not ventilate unnecessarily.
4. Size up the buildings in your district and plan ways and means of ventilating before the fire occurs.

TOXICOLOGY OF CARBON MONOXIDE

Carbon monoxide (CO) is the cause of more deaths than all other gases combined. Carbon monoxide, a colorless, almost odorless, tasteless, nonirritating gas, is produced by the incomplete combustion of fuels, such as coal, wood, gas, oil and gasoline.

Carbon monoxide is absorbed only through the lungs where it enters the blood stream in the same manner as oxygen. It exerts its harmful effects by displacing oxygen in the blood since it has approximately 210 times greater affinity for the hemoglobin in the blood than oxygen has. The resulting compound is carboxyhemoglobin which will not transport oxygen and also inhibits the remaining unbound hemoglobin from its normal function of oxygen transport. As a result, the patient is literally suffocating in the atmosphere containing ample oxygen. Some investigators hold the CO as an actual toxic action but this is not generally accepted.

As little as 0.07% (700 parts per million) of CO is capable over a period of time, of saturating 50% of the blood hemoglobin while a few breaths of 1.0% may cause 60% to 80% saturation and death.

It should be noted that shortness of breath and possibly a slight headache may occur after eight hours in a CO concentration of 100 parts of CO per million parts of air (ppm). This is the "threshold" limit recommended by many agencies for safe exposures eight hours a day, five days a week. Some authorities say that 100 ppm is safe for several hours. Some postwar investigators feel that the generally published "safe levels" may be too high. Again this is controversial. In any case the margin of safety is comparatively small if the working atmosphere is at the threshold limit of 100 ppm for eight hour periods.

Those more apt to be susceptible to CO poisoning are children and small individuals, persons putting forth more physical effort than others and persons with physical defects such as bronchitis, asthma, alcoholism, obesity and chronic heart or vascular disease.

CO asphyxia may occur in two ways. In case of prolonged exposure of high but not massive concentrations of CO, the symptoms are a sensation of tightness across the forehead, dilation of cutaneous blood vessels, frontal and basal headache, throbbing in the temples, weariness, weakness, dizziness, nausea and vomiting, loss of strength and muscular control, increased pulse and respiration, and finally, collapse and loss of consciousness. All of these effects are accelerated by exercise because of the need for additional oxygen. <u>All of the symptoms are seldom experienced by the same individual</u>. In cases where a victim is exposed to a sudden massive dose of CO or when the victim is at rest loss of consciousness may result without any of these warning symptoms. In the later stages of CO poisoning the blood pressure

2610

falls, muscular control is lost, reflexes are dulled and finally abolished, intermittent convulsions may occur, breathing becomes slow and shallow and finally ceases.

Since CO is not used or destroyed in the body it is eliminated through the lungs when air free of CO is inhaled. This is a slow process which may be hastened by administration of a mixture of 93% oxygen and 7% carbon dioxide (sometimes 95% - 5%).

0182 2611

FIG. 1

A closed building may be compared to an ordinary old fashioned "Pot-Bellied" stove, with all doors closed, the damper shut, and a coal fire burning inside. Unless the building is opened at the top first, the opening of a door or window at a lower point is about the same as putting on the draft of the stove without first opening the damper. The oxygen, thus permitted to reach the fire, will increase its intensity and the tendency to generate gases. With a stove shut down and coal gases building up pressure, sudden input of oxygen over hot coals can produce an explosive mixture and blast. Smoke explosions in buildings are generated much the same way.

2612

Basement fire in a 2-story and attic dwelling. Smoke and gases ascend via stairways and open doors and trap, to build up heat and explosive mixtures in attic.

FIG. 2

Fire is located on first floor in the kitchen. Smoke condition the same as in Fig. 2. Firemen should begin venting at peak of roof first. The next opening at spot marked "O". This will cause a cross venting of attic and will create a draft causing lower areas to be vented. Do not open below until vertical ventilation has been accomplished.

FIG. 3

2613

Where attic is sealed off, smoke from basement (or first floor fire) will tend to mushroom on second floor. In this case, natural horizontal (or lateral) ventilation is tried. First open window to leeward at top, then window to windward at bottom. Two circulators can be used to advantage, one pushing and the other pulling fresh air at vents.

FIG. 4

Fires occurring in basement might well travel through concealed areas to upper levels creating an explosive atmosphere. Care should be exercised in opening lower levels until upper areas have been vented.

FIG. 5

2614

FIG. 6

Rough diagram of typical "Taxpayer" occupying a full block front, six stores, construction as described on slide. Fire originating in basement (X) of food mart extends via basement stairs and unstopped partitions to cockloft - thence to exposures on each side. Fastest fire extension will be with the wind. Initial opening, skylight "A" with any sign of fire extending to real estate office, skip opening "B" and open at "C", with multi-purpose nozzle. Only after charged lines are in operation, open at "E" (Hatchway) and at "D". Another charged line should be positioned at "D". Check on all store basements. Breach food mart basement walls only as last resort to hit fire. Below street level ventilation not advisable. Pulling ceilings from below is often more satisfactory than cutting roofs.

FIG. 7

Water fog used in venting modern concrete and steel school. 500 g.p.m. Fog Nozzle on first line acted as a venturi after passing store room door, sucking heated smoke with it and pushing it ahead out the blocked-open main door. Second line (Fog) covers crew on first line.

SALVAGE

INTRODUCTION

It is difficult to describe salvage briefly and concisely. Webster defines it as "the act of saving, or that which is saved". Whether this saving is accomplished by using a hose stream on a fire or spreading a salvage cover, either constitutes salvage in the strict sense of the word.

Many persons believe the extent of salvage consists in spreading salvage covers over merchandise and removing water from buildings, but there is a great deal more to the subject than meets the eye of the casual observer.

A large portion of the fire waste in this country can be attributed to the operations of fire departments at fires. It is true, of course, that much of the loss from this cause is necessary but a large measure of the damage due to water, damage done in ventilating, overhauling and tracing fires and damage from the elements after a fire can be avoided.

There has been a growing tendency among fire department officers and men to extinguish fires in a systematic and scientific manner thus reducing to a minimum those losses incidental to the act of extinguishing fires.

Salvage needs no salesmen; its principles are sound and its practice pays a dividend in community good will which is an important fact in the welfare of every fire department, large or small.

In the following sections we will deal with only one phase of salvage which is the use of salvage covers in our battle against high losses.

If the officer decides that the water can be held on the floor below the fire, he then orders the floor covered with catchalls. In this procedure the stock and furnishings in the exposed area are always covered first. The floors are then completely covered and the edges of the covers rolled to hold water.

If the water threatens to run over the rolled edges, the covers can be raised by means of chairs, boxes or any other ready means of support. Boards, poles or rods can be used to excellent advantage if any are available in the immediate vicinity.

Officers and men working with salvage covers must be efficient and ingenious enough to make use of the material at hand and show initiative in adapting themselves to the diversified conditions which fires always present.

TYPES OF COVERS

Many different opinions exist among experts on the subject of salvage covers, or tarpaulins, as they are called. All agree, however, that a salvage cover should shed water and at the same time hold water under reasonable pressure when "bagged" or used as a catchall.

There are many types of materials used in salvage covers today. Included are the neoprene and rubber-covered canvas cover. Perhaps the most popular cover used by fire departments is the eight-to ten-ounce canvas cover treated so that it is water repellent. Many fire department salvage companies have also found that an inexpensive cover may be made from plastic or nylon. However, the treated canvas cover is still the most popular and widely used. Properly cared for, this cover material will give years of service.

The most generally accepted size for salvage covers is 12 feet x 18 feet. The cover should be made up of four 36-inch sections which are sewn together so that these sections will run the long way of the cover. Grommets should be spaced a maximum of 24 inches, center to center, along the edges with spacings of 12 inches to 18 inches being more desirable. A small piece of rope approximately 10 inches long can be placed in the corners forming a loop. The small loop will prove useful if pike poles are used in conjuction with the cover for covering vertical exposures.

SALVAGE COVER FOLDS

There are many types of salvage cover folds; each fold is designed for a specific job or for a specific reason. Popular folds used by fire departments are the accordion fold, the do-nut roll and the utility or one-man fold. Perhaps the most popular fold in use is the accordion fold; however, as each fold has its uses, consideration should be given to the value of carrying these other folds.

Accordion Fold: This fold is started with the cover spread out flat on the floor. All wrinkles are removed and the cover is checked to see if it is clean and free of holes. As time is not important in folding covers, take all the time needed to get a good neat fold.

The fold is made by two men grasping the corners in the long way of the cover and folding in a half section at a time to the center of the cover. This process is repeated on the other side until the cover has been folded into a long fold 36 inches wide. One operator on his knees facing down the long way folds the cover into small folds about 8 inches wide by grasping the cover about 8 inches from him and then pulling it toward himself. When completed, the fold should represent an accordion pleat.

To keep this fold in place, large rubber bands cut from a tire inner tube may be placed over each end of the folded cover.

There are many advantages in using the accordion fold but chief among them is the speed with which it may be unfolded. This may be done by the underhand or overhand throw.

The accordion fold is adapted to all cover problems. It may be used as a runner, made into a catchall and used as a cover on furniture or other goods. It should be remembered that when using this type fold for covering, it is a two-man operation.

Do-Nut Roll: The do-nut roll is started by spreading the cover out flat on the floor. Two men face each other, one at each end of the long way of the

cover, grasping the cover and using a slight pulling toward each other, roll the cover as tightly as possible to the center of the cover. Changing to the other side they repeat the process. When both sides have been rolled to the center of the cover, one man then rolls the cover from one end until he has the cover rolled--much the same as a section of hose is rolled.

The do-nut roll is best suited for making water chutes and, by grasping in center and shaking the cover out, it can be used for covering. Its chief use, however, is for removing water.

Utility Fold: The utility or one-man fold has many uses and has the advantage of needing less storage space on apparatus. This fold will not shake apart while apparatus is in motion. Perhaps the best use of the utility fold is in covering merchandise and using for other types of flat covering; it can be placed on object and unfolded by only one man.

Salvage Cover at Fires: The use of salvage covers at fires is one of the most important operations of the fire service. Following are some operations where salvage covers are used:

In mercantile and industrial establishments very little arranging of stock and furnishings can be done. Covers must, therefore, be placed over counters, shelves, cabinets, desks, machines and similar items that could be damaged by water.

In residence or offices the furniture can be gathered into a compact arrangement and then covered. Sometimes better protection can be achieved by placing a cover down and then moving the article onto the cover and covering it.

Covering of automobiles and sides of buildings, including plate glass windows, is sometimes necessary to protect the property from damage by heat and smoke.

Perhaps next to the covering of materials with salvage covers their use as water chutes is next in importance. The do-nut roll is best suited for this job. It might be necessary to use more than one cover to make a water chute from one area to another and to the outside. Be sure where two or more covers are used that water-tight connections are made.

Rural fire departments also use covers to assist in damming up creeks for water supply during pumping operations.

When using salvage covers to cover glass show cases or where salvage covers are covering material that may be broken by people standing on it or by rough handling in removing the covers, placing an object such as a piece of wood on the cover shall indicate to the persons removing the covers that the material underneath is fragile and care should be used in removal of cover.

There are many more uses for salvage covers which have not been covered here. However, good salvage cover work can be accomplished by any fire department. The principal requisite is that they use good judgement and do the things common sense dictates.

0585 2619

Care of Covers: Good salvage covers are expensive, approximately $40 to $45 each, and like any other type of investments, need certain definite care and handling.

They are subject to rough wear and tear and deterioration, but if properly inspected and kept in repair, their span of service will be many years.

The following rules should be followed to make sure covers give service for maximum number of years.

1. Officers should examine all covers, before folding and placing back in service, make certain the covers are dry and clean and do not contain holes.

2. Covers should not be thrown from roofs, windows or other openings above grade.

3. Folding should be done only where area is free from broken glass, debris or other objects which could cause damage to canvas.

4. Members should exercise care when removing covers from stock or machinery and avoid pulling them over sharp projections which might tear them.

5. Firemen should avoid walking on covers unnecessarily and should remove covers spread on stairways and floors as soon as possible. When it is necessary to fasten stock covers, nails should be placed through grommets only.

6. Covers carried on apparatus and not used for a period of thirty to sixty days should be removed, hung to air and refolded.

7. In covering roofs, men should be careful to remove all nails, sharp or jagged points of tin or anything that is likely to perforate or tear a cover.

8. Covers, after being wet and dirty from fires, should be washed and hung in towers to dry.

CIAS 2620

SALVAGE COVERS SPECIFICATIONS

RECOMMENDED MINIMUM SPECIFICATIONS FOR SALVAGE COVERS

1. Minimum weight of 10 oz. to square yard can be used, with a maximum weight of 18 oz. canvas.

2. Sections of canvas should be as nearly equal as possible. (Three sections.)

3. All seams to run long way of canvas, but not in center.

4. The size of the cover to be a standard of 12' X 18' (or 14' X 18' maximum.)

5. Seams to be double lapped with waterproof dressing and minimum of two rows of stitching.

6. Seams and edges of cover to be overlapped with minimum of 1½" width double material with at least two rows of heavy duty stitching, capable of withstanding pressure of water used in bagging operations without leakage with either side up.

7. Corners to be reinforced with maximum of layers of canvas and backed a distance of at least 4".

8. Metal grommets to be installed at least every 18" along outside seam with minimum interior opening of grommet to be at least ½".

9. Four corners of cover should have webbed loop sewn on to corner with at least 6" opening for use in hanging in tower for drying.

10. Covers to be treated with non-flammable waterproofing.

OVERHAUL PRACTICES

INTRODUCTION

Overhaul, by definition, is:

1. Search for and extinguishment of hidden or remaining fires;
2. Placing the building, contents, and fire area in safe condition;
3. Determining cause of the fire;
4. Recognizing and preserving any evidence or arson.

Location of Hidden Fires

Effective overhaul involves a thorough examination of building structure, contents, and debris to locate and extinguish hidden fires. Overhaul does not, in itself, guarantee that a fire will not rekindle. Its practice, however, enables firefighters to detect certain conditions where re-ignition is more likely than others. Where a possibility of rekindling exists, firefighters with adequate "watch lines" should be detailed to watch the property.

Placing Fire Scene in Safe Condition

Facts concerning the degree of safety of a fire damaged structure can be readily gathered during a proper system of overhaul. A number of unsafe and potentially dangerous conditions may be remedied during overhaul practices. The correction of such unsafe conditions such as hazardous processes, damaged utilities, structural defects,fire damaged contents, and unstable objects is of major concern to every fire department.

Determining the Cause

Proper overhaul will often disclose the cause of the fire. The ability of the firefighter to recognize the cause once it is exposed will depend on his training and the degree of care used in examining the fire scene. A fire cause involves the coming together of a "fuel supply" hazard and a "heat source" hazard. When the cause is determined, both the fuel involved and the source of heat which caused the ignition should be stated in the report. In addition to determining fire cause, a thorough practice of overhaul will usually pinpoint the locations and permit its removal to prevent any recurrence.

Recognizing and Preserving Evidence of Arson

Determining the cause of the fire goes hand-in-hand with recognizing and preserving evidence of arson. Among the items to look for in recognizing evidence are: separate fires, suspicious odors, deep wood charring and uneven burning, holes cut in walls and floors, inoperative fire protection devices, footprints, empty

containers, and residues of wax or paraffin. Careful overhaul procedures will permit some evidence to remain undisturbed and will permit the safeguarding of other evidence that cannot be left at the fire scene.

Overhaul Procedure

The extent of the overhauling necessary is determined by the size of the fire, the type of building or structure involved, its contents, and the degree of exposure to which nearby structures have been subjected. After a small, localized fire that has generated comparatively little heat, all that is necessary is to turn over the burned material to see that it does not contain any hidden fire and has cooled below the danger point. Special care in overhauling bedrooms and closet spaces is necessary to determine that no rekindling will occur in bedclothes, mattress stuffing, and wearing apparel.

Following an extensive fire, the procedure is more complicated. If the fire has broken through windows on a court or air shaft opposite another building, or if the fire building is flanked by a higher building exposed to heat and smoke, overhauling should include those additional structures. If sparks have been carried over a wide area, many buildings may need to be examined.

In addition to working over the debris after a fire, window frames should be opened up, ceilings pulled, and walls opened where there is possibility of fire having entered. Thorough inspection of the fire floor as well as floors above and below should be made to guard against rekindle due to concealed fire.

Combustible partitions should be opened at any point blackened by fire or where the surface is too hot to hold the hand. At such points, the fire is usually burning in the underlying woodwork. Such a fire may burn like charcoal, without flame.

A charged line should be readily available as a flare-up is likely to occur when the partition is opened.

Fire weakens a structure, so be careful where heavy materials are stored that a collapse of a floor or other part of the building does not occur. Paper, rags, cotton, excelsior and similar materials will absorb large amounts of water, the added weight of which may cause collapse. A thorough examination should be made before overhauling is begun. Accumulated water should be removed from the floor to relieve it of this weight.

Shut off gas and electricity before overhauling, if this has not been done. If holes have been cut in the floor for ventilating, to reach hidden fire, or to drain off water, or have been burned through by fire, close them or block them off so persons do not fall through. Chairs, desks, or doors are useful for this purpose.

Block entrances to burned out stairways. When articles must be thrown from windows, station a fireman below to keep people from walking into danger. Plan the work so that it will not be necessary to rehandle material.

BASIC FIREFIGHTING STRATEGY, TACTICS,

AND PRE-FIRE PLANNING

2624

FIRE FIGHTING STRATEGY

PREFACE

It is not the intention to cover the entire subject of fire fighting strategy. An attempt to do so in detail would be impossible. While it can be said that no two fires are alike, there are certain basic rules that can be applied to all fires and standard practices that can be used on certain types of fires. This discussion will be confined to the recommended technique of fighting common types of fires and to the general duties of officers at fires.

LEADERSHIP

It can be assumed that any job involving the use of a number of men can best be accomplished if one man is in charge and directing the operations. This principle holds true in volunteer as well as in the paid departments. It is impossible to organize a systematic coordinated attack without leadership. The selecting of leaders and the setting up of a schedule whereby an officer will answer to every alarm becomes a basic rule of fire fighting strategy.

FIRE PROCEDURE

There are certain rules governing the actions of the officer in charge of a fire. Application of each of these rules is essential to accomplish a successful and complete job on the fire. They are:

Size-Up
Calling for Help
Saving Life
Protection of Exposures
Extinguishment of Fire
Overhaul

1. SIZE-UP. The size-up of a fire is the first responsibility of the first officer arriving at a fire. His orders, given the first few seconds upon arrival, determine the general course to be followed. Attention to detail is necessary so that he is right the first time because a radical change in plans later results in confusion, delay and the necessity of reorganizing broken-up crews.

   Some of the items to be considered in size-up are:

   a. Geographical features of territory--roads, alleys, hills, ravines.
   b. Location of fire within building--probable extent.
   c. Construction of building--height, masonry, frame, mill, open stairways, elevators.
   d. Occupancy--factory, residency, hotel, rest home, hospital, heavy machinery, refrigeration systems, chemical storage, etc. Estimate effect water may have on contents as to expansion, chemical reaction, etc.
   e. Wind, weather, ice.
   f. Exposures--inside and outside means for fire to spread.
   g. Equipment available on building--fire escapes, standpipes, sprinkler systems.

h. Water available--location of hydrants and flowing pressures, creek, lake, river, booster tanks.
i. Life hazard.
j. Accessibility of fire.

Note: It is a fact that the first five minutes of a fire are more important than the next five hours.

2. CALLING FOR HELP. The first officer arriving at a fire should call for help immediately if this is going to be necessary. He should never underestimate a fire and he should have a full knowledge of equipment available not only from his own department but also from neighboring departments. This knowledge should consist of manpower, hose carried, capacity of water carries, pumps, ladders or special equipment.

The kind and amount of help wanted should be specified.

3. SAVING OF LIFE. Although listed third, saving life is the most important duty of a fireman. Size-up and calling for help are usually completed at the time of arrival or a moment thereafter and when life is involved, life-saving operations are commenced immediately although it may mean temporary suspension of fire fighting operations. Frequently, some lines must be brought into use as an aid to getting the occupants to safety or to confine the fire to a part of the structure as other portions are evacuated. Frequently it is necessary to use fire streams to clear a path for rescue operations.

4. COVERING EXPOSURES. The protection of exposures means to use all available methods to keep the fire confined to the area involved at the time the fire department arrives. Exposures may be either external or internal.

a. On external exposures, the officer must consider wind direction, type of buildings that may be involved and the placement of lines to protect the threatened exposure and at the same time lines to operate on the fire.

b. Internal exposures usually mean the protection of all vertical and horizontal openings that lead away from the fire area. These openings must be protected by charged lines.

c. The surest method of preventing spread of fire is a quick concentrated attack on the seat of the fire.

5. EXTINGUISHMENT. The main effort of extinguishment is directed at stopping the spread of fire from room to room, floor to floor, building to building and to confine the fire to as small an area as possible.

6. OVERHAUL. The officer in charge should never underestimate the importance of complete overhaul operations. Some of the objects to be attained are:

a. Make sure all fire is extinguished and thereby prevent re-kindling.

b. Observe evidence that might lead to the cause of the fire such as arson, overloaded wiring, defective heating installations, etc.

c. Aid salvage operations by systematic disposal of partially burned material and debris.

FIRE FIGHTING TACTICS

The term tactics means the deployment of men and equipment in such a manner as to make effective control of a fire situation possible.

This particular section on tactics has been developed to assist you in setting up tactical operations for combatting the residential type fire.

The information given here is to be used as a guide to assist you in determining which type attack line will be most effective.

Emphasis has been placed on the use of 1½" pre-connects and 2½" attack lines in the belief that only limited use of booster lines should be used in attacking fires in residential type buildings.

LIMITATION OF SMALL LINES - Residential Fires

The fire officer is faced with many command decisions when he arrives at a structure fire. One of his first commands must be the designation of the size line or lines to use on the first attack.

Standard operating procedure in most fire departments calls for a 1½ inch attack on a residential or similar sized building. Experience has shown while most dwelling fires can be brought quickly under control with 1½" lines all dwelling fires cannot be successfully fought with small lines and the wise fire officer will always be ready to back up the 1½" lines with a 2½" line.

In many instances the officer should order a 2½" for the first attack if there is any question that the fire power of the smaller lines will not be adequate to control the situation.

There are many variable factors in structure fires but two that should be considered, in relation to the size fire stream to use, are:

Confined Fire

Does the size-up indicate that the fire has been burning over a relatively long period involving the structure as well as the contents? Many firemen have had the experience of fighting a building fire where the attack will black out an area then the line is moved to another target and the flames flash up again. This is because the material has been heated well below the surface making it what we would call a deep-seated fire and combustible gases will continue to be released in the fire area and become reignited from unquenched flames. In comparison to a surface fire of shorter duration the deep-seated fire will require a much greater delivery that may be accomplished better with large attack lines.

Free Burning Fire

Is the fire confined or has it become an open fire? The experienced fireman will know that an 1½" attack has much greater potential in the confined type

of fires where the cooling value of the water can be more fully utilized. The open fire may not involve any more fuel or even heat but its very lack of confinement will require streams of greater capacity both as to gallons per minute and area that must be covered.

FIRE LOADING

In order to better realize the potential fire severity of building fires, including residential, we should take a look at the results of fire tests that have been conducted by the National Bureau of Standards. These tests have been of value in making it possible to express in terms of "fire loading" the severity of a fire hazard as represented by the weight of combustible material involved.

The term, "fire load", means the amount of combustible material in a building and includes both the contents and the combustible parts of the structure. The relationship between fire loading and fire severity in terms of hours duration can then be related to the amount of fire protection required.

Average Weight of Combustibles Per Square Foot (contents)	Hours Duration
5 lbs	1/2 hour
7½ lbs	3/4 hour
10 lbs	1 hour
15 lbs	1-1/2 hour
20 lbs	2 hours
30 lbs	3 hours
40 lbs	4-1/2 hours
50 lbs	6 hours
60 lbs	7-1/2 hours

The Bureau has also made a study of the <u>average</u> fire loading in various occupancies and these figures can be of assistance to pre-plan the size of the attack necessary for these conditions.

Residential	5 to 10 lbs
School	5 to 10 lbs
Institutional	5 to 10 lbs
Assembly	less than 10
Business	10 to 15 lbs
Mercantile	15 to 20 lbs
Industrial	25 plus or minus
Storage	30 plus or minus

All of these tests were conducted in buildings of non-combustible construction and, therefore, in buildings of ordinary construction the possible fire loading could be <u>twice</u> the figures given. In dwellings the fire loading will be greater due to interior finish, exposed wood trim, combustible structural members and storage in basements, attics and closets.

In the older type dwellings considerable fire loading can be added because of wood sheathed walls and ceilings together with felt and wallpaper finish. It can be seen that a totally involved large dwelling could easily approach the

fire severity or exceed that of an average mercantile or business building where a 2½" line would be a standard lay on the first attack.

In a hypothetical situation assume that fire has gained considerable headway in two rooms of an average residence. Experience has shown that heat production of 1,000,000 or more BTU's (British Thermal Units) is very possible. One gallon of water has the heat absorption capacity of 8,000 BTU and a single 1½" line with a discharge of 60 gpm would have a cooling capacity of 480,000 BTU. In this situation the heat is then building up at almost twice this figure. A second line of equal size would be needed for a quick extinguishment.

In another hypothetical situation involving a dwelling the fire area is twice this size. It is an older building and the fire loading is relatively high. Heat production could be in the neighborhood of 2,000,000 BTU or more per minute. The line or lines used on the first situation would have little initial effect.

Assume in the next situation that this older building is totally involved. Heat production is 4,000,000 BTU or more per minute. Here, two 1½" lines at 60 gpm would absorb 1,000,000 BTU per minute. It can be seen that with almost 3,000,000 BTU's in excess of the heat absorption rate the fire would continue to burn out of control. Therefore, fires of this size would require 2½" attack lines or combinations of 1½" with equal heat absorption ability.

While these are only hypothetical situations the points to remember are: (1) Standard operating procedures should recognize the value of the 2½" line with a discharge of 250 gpm or more as being appropriate for certain residential situations, (2) Standard operations should call for two 1½" lines working together on the same target area whenever there is doubt that a single small line will be effective, (3) Tanker or booster operations should be developed to utilize the fire power of the 2½" line.

TACTICS - Effective Use of Nozzles on Hand Lines

Each tactical operation on fires requires teamwork and the nozzleman plays a very important role in his team operation. Together with the anchorman the nozzleman must be quick to grasp the requirements of the situation and then employ the proper tactics to gain control of the fire.

2629

2630

BACK UP LINES FOR PERSONNEL PROTECTION

SMALLER LINE PROTECTING LARGER LINE

Figure 1

USING BACK UP LINES FOR PERSONNEL PROTECTION

In some fire situations radiated heat may prevent the attacking line from gaining a position of advantage or perhaps holding its position. A smaller second line, booster or 1½", can be used to provide a water curtain for protection of the men on the attacking line. This back up line may be in front, to one side or in the rear just so the spray protects the operator and the other nozzle crew.

As the main attacking line moves in and knocks down the body of the fire, the back up line can be converted to use on spot fires and overhaul.

OPENING UP FOR ATTACK

WRONG METHOD 2630 Figure 2 RIGHT METHOD

OPENING UP FOR THE ATTACK

Fire fighting is generally more effective at close range and the tendency to open the nozzle before getting into position where the stream is on its target wastes water as well as slows up the attack. A line may be quickly advanced to position before it is opened but it becomes difficult to maneuver and hard to keep on target if opened and still being advanced. In general the nozzleman and anchorman should get into a close-up position before opening up.

A nozzleman may wish to open up to clear air from the line as he makes the approach. He may also throw a burst or two in order to set his nozzle pattern before reaching position.

MOVING POSITION WITH CHARGED LINE

INCORRECT PROCEDURE

Figure 3

MOVING FROM ONE POINT OF ATTACK TO ANOTHER

It is good practice to shut down the nozzle when the line is to be moved. This is true with small lines as well as with the large hand lines. While there are exceptions where it is necessary to keep a line in operation it is seldom possible to maintain an effective stream on the target when moving from one point to another. Here, again, the nozzleman is in a position to conserve water when the supply is short and he will also speed up the attack at several points by shutting down when making the moves.

2631

INDICATIONS OF A SUCCESSFUL ATTACK

The nozzleman is in a position where his judgment and actions during the progress of an attack will improve theefficiency of the entire operation. He should shut down when his portion of the attack has been successful and he can be guided by one or more of the following indications:

a. Blackout of visible fire.
b. Smoke production ceases with water vapor predominating.
c. Both smoke and water vapor exhaust become "lazy" evidence that heat has been reduced to a nominal level.

While the nozzleman himself may not be in the best position to see these signs he can be aided by the anchorman who may be in a better position to observe.

If the reactions as described do not occur after a reasonable time, then he would know that an attack from this point is not effective and he would seek another point of vantage.

CHANGING PATTERN OF FOG STREAM

The nozzleman must be quick to recognize the need to cover as much of the fire area as possible in order to cool evenly and get the most value from his nozzle discharge. This may require him to alter the discharge pattern several times during an attack. Drill practice at handling all nozzles with wet lines will keep firemen familiar with the mechanical features of the combination fog and straight stream nozzles they will use at fires. During hose drills the wet line should always be used whenever possible.

USING HOSE LINE AS A GUIDE LINE FOR INTERIOR OPERATIONS

In interior fire fighting operations the nozzleman should be aware of the need to keep unnecessary slack or play out of the line after it is brought within the building. Confidence in the knowledge that the line furnishes an excellent guide to the outside should interior conditions require a retreat will result in greater aggressiveness at the nozzle end. This is also a fundamental safety requirement. Men who are backing up the nozzle should aid in this respect because they are in a much better position to control the play hose as it is brought in.

OPENING AND CLOSING NOZZLES

Always open a nozzle progressively in order to avoid sudden back pressure that will throw you off target and cause loss of control. Closing down smoothly is equally important since a sharp shut down will put an excessive strain on the hose. This is especially important when relatively large volumes flowing through 2½" hose are suddenly brought to rest. The back pressure may momentarily exceed the service test pressure of the hose.

Pre-Connected Hose Lines

With the universal scarcity of manpower for the first alarm response the pre-connected line is the greatest asset toward a fast attack that has been developed in recent years. Through the use of pre-connects firemen get water on the fire in seconds after arrival and most small building fires are brought under control with the water carried on the pumper. No experienced fire officer will, however, fail to back his attack with a supply line from either a hydrant or a tanker whenever possible.

THE RESIDENTIAL TYPE FIRE

Because most residential fires are handled easily with a minimum use of manpower and equipment it is easy to direct our tactical planning in other, seemingly more important, directions. From the viewpoint of life safety experienced fire officers never take a residential alarm for granted because they know that all too often rescue of trapped occupants is directly contingent upon the success of a fast, mobile and aggressive attack that permits firemen to get in and stay in and get at the people within.

What is the relative importance of residential fires in the total alarm response? For some fire departments serving areas primarily residential most of their alarms to structures are in dwellings or out-buildings and for fire departments as a whole throughout the United States about 70% of all fire fighting activity is directed toward the control of dwelling fires. These fires assume great significance when they are related to the annual fire loss of some $1,500,000,000 when it is realized that about one quarter of this loss is accounted for by residential fires. It follows then that in spite of modern building codes and improvements in construction there is still plenty of combustible material to burn and, of course, the contents in homes are as flammable as ever. We also have a good percentage of dwelling fires occurring in the older home where we have serious fire fighting problems due to antiquated construction and the unusually heavy fire loading that is commonly a characteristic of dwellings built when shiplap was so much cheaper for interior walls than plaster.

Another aspect worth considering is the susceptibility of residential areas to a conflagration hazard. A brief study of the history of major conflagrations will show a high percentage have involved residential districts. The two prime factors have been: (1) the closely built combustible construction characteristic of many residential areas and (2) the use of wooden shingles that literally breed "crown" fires through radiated heat, convection and the fallout of burning brands. Cities both large and small as well as unincorporated living areas may have potential conflagration breeders in residential sections that need only the right conditions of humidity, wind and a fast-burning exposure fire.

The Typical Residential "Target Hazard"

The average modern three bedroom, one story dwelling contains about 26,000 board feet of lumber and the interior will be either plasterboard or plaster on gypsum lath. The fire loading of this residential type will be as follows:

Movable Property	Floors	Exposed Woodwork (Other than floors)	Total
3.4 lbs./sq. ft.	2.6 lbs./sq.ft.	2.8 lbs./sq.ft.	8.8 lbs./sq.ft.

This total average fire load is relatively light and it represents a fire severity of from ½ to 1 hour duration. Because of the plastered (or plasterboard) walls and the small amount of exposed woodwork in the living areas other than floors a total involvement with a "flash-over" effect is seldom seen in this dwelling. All fires in this type of dwelling (Figure 1) will

not be easy to subdue but a pair of 1½" lines working together will do the job except in rare instances when the fire is completely out of control and exposures threatened.

Figure 1

In contrast let us look at the older, two-story residence (Figure 2) many of which have wood sheathing on the interior walls plus felt paper and wallpaper to support a flash-over through all open and interconnected rooms. In this building we will find approximately the same square foot fire loading of combustible contents plus a vastly increased combustible surface area to feed the fire. The exposed woodwork may amount to 13 lbs. or more per square foot bringing the total fire load to 19 lbs. per square foot--more than twice the figure of the newer residence. This is the typical "target hazard" dwelling where we can anticipate the use of a 2½" line to back up the 1½" lines or if the involvement is total, a 2½ for the first attack.

Figure 2

2633 2634

The potential fire loading in some of the older dwellings may be further illustrated by a comparison of board feet of lumber in the structure as compared to the average one-story ranch type dwelling containing from 18,000 to 25,000 board feet. The dwelling in Figure 3 contained 48,514 board feet of bone dry lumber with much of it exposed on the interior walls and ceilings. The night fire shown in Figure 4 was in a dwelling of this type. The attack was made with one 2½" line equipped with a 300 GPM combination nozzle and two 1½" lines equipped with 70 GPM combination nozzles. This situation was brought under control by the 2½" line with the 1½" lines being used for final extinguishment of spot fires onthe lower floor and the major fire areas on the second floor and attic. Approximately 1000 gallons of water was used in the major attack and 500 gallons to control the fire in the second floor and attic.

Figure 3

Figure 4

2635

The 2½" Pre-connect Line. Can two or more 1½" lines with the combined discharge of a single 2½" line equal the larger line in fire power? Theory says yes, but most fire officers have found that it is not an easy thing to keep multiple lines on the same target. Each nozzleman sees his particular target and acts automatically as an individual to fight the part of the fire closest to him. This results in a wider distribution of water and less concentration in the critical area where we want to achieve quick control. The single 2½" line for these conditions might well be a better choice. Another factor that diminishes the effect of several small lines working together on a single target is the effect of air currents in a fast-burning fire. These currents are strongly upward and away from the fire and their force may prevent a smaller line from reaching into the target area. This is not an infrequent occurrence in fires that have developed a strong thermal updraft the effect of which can be overcome by a 2½" line with its larger concentrated delivery--it punches through to the fuel area.

Another advantage of the 2½" pre-connect in residential fire fighting is that a single, quick, large delivery of water covering a span of 15 to 20 seconds will bring the fire down to a size that allows entry to the building and rapid follow-up with 1½" lines for interior operations. Fast entry is one of the key points in fire fighting and most surely the principal aim when rescue is indicated.

When thinking in terms of water delivery and the need to conserve it when supply is short, it is well to reflect that if a 250-300 GPM attack will do the main job in 60 seconds, you may well be using less water than if you fought the same fire with half the discharge for two or three minutes. This is especially true if the smaller attack does not black out its target and you would have to change to either a larger line or add an additional line following the original attack. In the meantime you could have gained considerable headway.

The advantage of the 2½" pre-connect in terms of the time saved is the same as with the 1½" pre-connect--a faster attack in the first few critical minutes when small crews have many things to do all at the same time. If time can be saved in making up a hose line, that time may be used for putting up a badly needed ladder or getting in a second line for a threatened exposure.

Finally, let us take a look at the relative extinguishing capacity of the 1½" line versus the 2½" line:

Size Line	GPM	Heat Absorbed (90% efficiency)
1½	70	560,000 BTUs
1½	100	800,000 BTUs
1½	125	1,000,000 BTUs
2½	200	1,600,000 BTUs
2½	250	2,000,000 BTUs
2½	300	2,400,000 BTUs

Disadvantage of Pre-Connect Lines

The inherent disadvantage of the pre-connect is its fixed length that may not be sufficient for some fire situations. In general it can be said that when longer lines are needed it is quicker to make them up from the free hose in the hose bed rather than run out a pre-connect and then extend it. Of course, hose arrangements will vary from rig to rig and between fire departments and some may prefer to extend the pre-connects.

BASEMENT FIRES

This type of fire, while not spectacular, is usually the worst type of fire you will have to fight. The basement is usually the storage place for quantities of highly flammable material which may, and usually does, produce excessive heat, toxic and explosive gases.

1. First line should be taken in on the floor above the basement and used to cover the opening from the basement to this floor. The line should not leave position at the head of the basement stairway unless it can be used to better advantage on other vertical openings up which fire is spreading. A simultaneous effort to ventilate this floor may be necessary in order for the line to hold its position.

2. Another line should be stretched to the exterior opening to the basement and fought in to the seat of the fire.

3. When the seat of fire cannot be reached, cellar pipes or distributor nozzles should be ordered immediately.

4. Ventilate all floors as quickly as possible to check for vertical extension of fire through partitions, furring strips, vent ducts, etc.

ASSUME THIS FIRE HAS EXTENDED AND INVOLVED STAIRHALL OF MULTIPLE-STORY BUILDING

1. First line stretched to position in entrance hall, direct streams upward to prevent loss of stairway on the upper floors.

2. At same time order roof opened up above stairway to prevent mushroom effect on upper floors.

3. Cover the basement stairway through which fire has extended with the first line if this can be done without leaving the upper part of the stairway unprotected.

4. Stretch in another line to work down the basement stairs or if first line can cover basement opening, stretch second line to basement via an exterior basement stairway.

Note: Remember to order breathing equipment to be used when making an attack on a smoldering basement fire that cannot be quickly ventilated. If you cannot see "live" fire in the burning area, it may be that the oxygen content is too low for firemen to work without self-contained masks.

2637

CHIMNEY FIRES

1. Determine if the chimney is on a bracket or built to the ground.

2. Send one man to the attic to determine the condition of the chimney and to check for any evidence of a wall fire. If his report is favorable, send the same man back for a final look before leaving.

3. If necessary to extinguish the fire in the chimney, use a pump can or booster line. Application of water at the top of the chimney is usually best although flue holes may be used if the top is not accessible. Unusually hot chimneys may require a rather large amount of water. A small stream of water in a very hot chimney will have little cooling effect.

4. Minor chimney fires may be controlled by the use of salt, soda, dry powder, or even tetrachloride. Application should be at a point where the extinguishing agent can be applied directly on the fire; drafts should then be closed to obtain a smothering effect.

5. Fireplaces should be covered to avoid smoke and soot loss.

6. Check for unused flue openings as these are weak points and may be responsible for a wall fire.

7. Use the same precautions against water damage that you would use on any other fire.

8. Spray roof and gutters for sparks.

9. Leave chimney and pipes clean.

GREASE DUCT FIRES

1. Use same precautions against extension of fire as for chimneys.

2. Extinguishment by the use of water fog is best and the application should be made at a level with or below the fire. Usually a clean-out opening is present--if not, an opening into the duct may be made with the pick end of an axe.

3. Application of CO^2 is seldom effective unless it may be applied in large quantity; otherwise a "flash-back" will occur.

4. Take proper salvage precautions.

ELECTRIC MOTOR FIRES

1. Cut off the current.

2. For minor fires, tetrachloride, dry chemical or CO^2 is effective.

3. Do not use chemical foam.

4. If the wiring is burned out and motor is extremely hot, use a pump can or booster line.

2637 2638

Note: Caution must be taken to cool the motor cage slowly and avoid sudden contraction that may cause the cage to crack.

PARTITION FIRES

1. Open wall between studs using a tarp to catch debris.
2. Direct line upward and downward.
3. Check wall and floor above the fire.
4. Check attic through ceiling scuttle.

Note: Indications of a wall fire are: blistered paint, live smoke issuing from baseboards on floor above, sound cf fire in wall by placing ear against surface.

ATTIC FIRES

1. An attic fire should be fought from below; that is, by taking a line into the attic through an interior opening such as a ceiling scuttle or a hole cut in the ceiling.
2. As complete overhaul of the attic will be needed, it MAY be necessary to open the roof for ventilation or to stop the fire from mushrooming.
3. Salvage operations should be simultaneous on the floor below.
4. In a few instances it will be practical to make an entrance to the attic through a hole cut in the roof just above the eaves.
5. The main electrical switch should be pulled before men are sent into the attic.
6. Beware of a deficiency of oxygen or accumulated toxic gases and order respiratory equipment used when required.

ROOF FIRES

1. The basic rule is to make a quick check of the attic to see if fire burned through.
2. Surface fire may be quickly knocked down with ground lines or with ladder lines where height is a factor.
3. Protect lee side exposures.
4. Roof ladders must be placed and the burned surface thoroughly overhauled.
5. Salvage operation on the floor below the attic or in the attic itself should be simultaneous with attack on the fire.

FRAME DWELLING HOUSE FIRES

1. The average fire in this type of structure may be handled by two 1½" lines. One line is used to operate directly upon the seat of the fire; the other line to maneuver as needed to protect interior or exterior exposures.

2. Ventilate that part of the building not directly involved to learn if the fire has spread through vertical or horizontal openings in the structure.

3. On night alarms use the first lines to cut off the fire from the sleeping quarters and keep lines of exit open.

4. Observe the direction fire is traveling and open walls and ceilings ahead of the fire to prevent extension.

5. Get above the fire immediately; locate the ceiling scuttle and check the attic space.

6. Begin salvage operations immediately.

7. If fire has involved the structure of the building, cut off the main electric switch.

BUILDING CONSTRUCTED IN ATTACHED ROWS AND MULTIPLE OCCUPANCIES

1. In this type of structure there is a cockloft or open space between the top floor ceiling and the roof. This space may not be fire stopped horizontally.

2. Open up the ceilings on each side of the fire and use lines to stop extension.

3. Make a simultaneous attack on the seat of the fire.

4. Ventilate to prevent fire from mushrooming through the unprotected cockloft space.

5. Begin salvage operations immediately.

FIRE IN FURNISHINGS OF A SINGLE ROOM

1. Use only enough water to knock fire down and remove large pieces of furniture for final overhaul.

2. Ventilate simultaneously with attack on fire.

3. Check immediately for burn into structure of building.

4. Begin salvage operations immediately.

2640

GENERAL RULES OF FIREFIGHTING

1. There is no substitute for complete knowledge of buildings, contents, water supply, etc., to insure a good job of fire extinguishment.
2. Fit your fire stream to the fire. On certain fires several small streams may be ineffective while a large stream, using the same total delivery, will progressively black out each area of fire within range.
3. Fog lines permit a rapid advancement on a fire when radiated heat is a problem.
4. A fire stream can be 100 per cent effective when directed from a point just within a doorway; two feet back from the doorway may mean a 75 per cent loss in effective reach.
5. Discharging water into smoke when the fire cannot be seen is seldom good practice.
6. A line should always be shut down when the portion of the fire it can reach has been knocked down.
7. When an operating fire stream is moved to another point of vantage, it should be shut off during the transfer.
8. Attic fires should be fought from the inside through a ceiling scuttle or from a hole made in the ceiling.
9. Water fog should be used to cover vertical openings if extension of the fire through these openings is anticipated.
10. Water fog should be used to prevent the rise of heated gases and toxic fumes up vertical openings in multiple storied buildings having a life hazard occupancy.
11. Grease, oil and similar fires should be extinguished with water fog except where water damage is a factor.
12. Water fog is used to reduce heavy concentrations of ammonia fumes.
13. The best angle of penetration for an exterior fire stream is 32°.
14. Ground operated fire streams have very little penetration when used on fires above the second floor.
15. Chemical foam should not be used on charged electrical equipment.
16. Pole fires require the assistance of the power company as a general rule.
17. The first line at a basement fire should be stretched to protect the upper part of the building.
18. Always restore an automatic sprinkler system to full operation before leaving the premises.

2641

19. When salvage operations are indicated, they should start immediately.

20. Self-contained breathing apparatus should be used on all unventilated fires below the ground level.

21. Fires involving buildings of public assembly, schools, hospitals, hotels, etc., require immediate attention to evacuation proceedings.

22. Deep seated fires in class "A" materials--wood, paper, textiles--require solid streams for complete extinguishment.

23. Rapid extinguishment requires:

    Speed of action
    Operation on the fire at close range
    Quick maneuvering of fire streams

24. Buildings equipped with sprinkler systems--lay two lines immediately to the sprinkler, siamese and keep sprinkler going at top efficiency.

25. For fires in upper stories, work line up inside to obtain a toehold on the floor involved.

2641
2642

PRE - FIRE PLANNING

Pre-Fire Planning is a standard operation in a number of our departments in this state and across the nation.

The fire departments who have taken advantage of the opportunity available to do a better job of Fire Prevention and Fire Fighting for their communities or cities have been very outspoken in their praise for the advantages and benefits they have received due to their efforts.

This talk is directed to the departments of city, town, or fire district who have not yet tried Pre-Fire Planning or adopted such a program.

Your departments who have not are missing one of the golden opportunities to receive some of the benefits which have come to every department which has made the effort at little or no cost in dollars and cents to the department or others.

Many of you have heard or read of the Nation-wide or State-wide efforts which are being made by the Chiefs' and Firemen's Associations. Millions of words have been written or spoken, with many methods of conducting the program suggested.

We cannot give all the suggestions which have been made or advice which would cover all situations which may be encountered, so will give an overall outline we hope will be of assistance to you in setting up your own program and procedures. You may wish to add to or subtract from to fit your city, town or fire district conditions.

The use of the National Fire Protection Association "Inspection Manual" will give you very good information on what to look for, how to prepare for inspection and make drawings of buildings and surroundings, etc. and will be helpful in answering questions on problems run into in the ordinary line of duty or fires. References are made to other material which may be used to secure information on specific problems.

It is recommended that the inspection for Pre-Fire Planning should be for that specific purpose rather than as a part of, or incident to, the regular fire hazard inspection. The reason for this is that they are conducted for different purposes. One is a Fire Prevention function, while the other is a Fire Protection one. They are two different types of inspections for two different purposes and do not tend to accomplish their specific purposes through a single inspection in areas with larger department and Fire Prevention Divisions.

In smaller departments and districts, Pre-Fire and inspections can be combined if properly applied and handled.

Fire hazard inspections are conducted under special laws designed to eliminate hazardous conditions as causes of fires. They are conducted for the purpose of trying to eliminate the possibility of fire. While on the other hand, a Pre-Fire Inspection is conducted as part of the fire protection program to better enable the Fire Department to combat the fire if it occurs.

PRE-FIRE PLANNING (contd.)

Outstanding benefits to your department available through Pre-Fire Planning are:

1. Better Life Saving and Fire Fighting is possible due to knowledge of building and contents.

2. You will build up good "Public Relations" due to your showing interest in the property of the people you protect.

3. Will bring about better building and content conditions by educating the public in fire prevention in their own homes or buildings.

4. Bring about better personal safety to members of department due to knowledge secured while going through buildings.

5. May help in detection of Arson or prevent Arson attempts.

PREPARATION FOR PRE-FIRE PLANNING:

There is no finer way to bring about good public relations between your department and the people you serve than through personal contact in their homes or places of business. You have the chance to tell them about ways to prevent fires and loss of life or property, right on the spot where the fire may occur.

When the pre-fire inspection is made, it should be with the owner's permission. The purpose for which the inspection is being made should be explained to him. If this is conducted properly, the owner can be made to feel that he is receiving personal consideration; and in effect, he is, because his building represents a specific problem which you are studying to meet. He should learn that you are planning on the best means of meeting his specific problem if it should occur. He learns that as a result of the inspection you are making, that you are preparing yourself to render him prompt and efficient service if he has a fire.

Experience has proven that making advance arrangements or appointments for pre-fire planning visits work out very well.

It has been found that where a business is contacted and arrangements made ahead of time, that the average business owner does not want the firemen to see his premises in poor condition and will make a special effort to have things neat and clean for your visit. If nothing else is accomplished, you have caused housekeeping to improve and trash removed which may have been in place for months or years prior to the visit and have been definite fire hazards.

Arrangements are made in various ways. Some use leaflets, letters or newspaper and radio mediums to reach the home owners, letting them know that companies of firemen will contact them at their homes for check. Home owners are asked to call in for inspections, or members of the fire department will stop at their door and ask if they wish inspection. These methods and others will have to be determined to fit your local conditions.

2644

PRE-FIRE PLANNING (contd.)

For visits to business or industrial property the approach will have to be different from home inspections with procedures along the following lines being very successful.

The officer who is to be in charge of the Pre-Fire visit makes contact with the owner or occupant of the property and makes an appointment for trip which will be convenient for both parties.

Care must be taken to see that you do not disrupt the normal business any more than necessary during visit.

Written material such as the following is sometimes used to good advantage:

TO WHOM IT MAY CONCERN:

We would like to acquaint you with the purpose of the Pre-Fire Survey conducted by the officers and men of the fire fighting companies of your fire department.

This is not intended as an inspection to find defects but a survey to acquaint all members of the department with the type of building structure, floor plan, stairways, exits, roof openings, electrical switches and equipment, amount and type of merchandise and many other such features.

A knowledge of these facts help the firemen greatly in the saving of life and property and all phases of fire fighting procedure.

These surveys are definitely recommended by both the National Board of Fire Underwriters and the National Fire Protection Association and are carried on by practically all progressive fire departments in the United States.

If there is any special desired time for these surveys, we will be glad to co-operate. END.

Samll properties such as dwellings, one-story stores, service stations and the like may not require much preparation before making inspections. But, any property of any size must be reviewed at least in the inspecting officer's mind before inspection is started. A blueprint of property and processes may be obtained from management of property, prior to inspection and reference books may be consulted.

INTRODUCTION:

Extra effort to create a favorable impression will aid the department in securing courteous recognition and treatment.

Men making the inspection should be neatly dressed with shoes shined and hair in place To secure favorable impression from public, a uniform appearance will be very helpful with men dressed in dress uniform, department coveralls and uniform caps, or whatever your department has as uniform dress.

If these are not available, turnout coats and helmets will be better than ordinary street or work clothes as a uniform appearance will mark you as being a fireman rather then any person they would be apt to see on the street.

PRE-FIRE PLANNING (contd.)

The men should be introduced to the person showing them around the premises and as a group goes through the property, they should stay together and not handle merchandise or make individual side trips.

The officer in charge should be the one to do the talking, with other men speaking or making comments only when necessary. Many men talking at once will create confusion and give poor impression. Listen to all instructions or information the management may give and pay particular attention to any hazardous conditions, processes or storage which may be in or around the building.

You may find it helpful in many cases to go to the top of the tallest building in the area to start the inspection in order to visualize the property as a whole

In each building, it is recommended that you start at the top, but in any case the routing should be systematic, not missing any areas. Every room, closet, attic, concealed space, basement or other out of the way place where fire might start should be inspected. All vertical openings or openings in walls or ceilings should be noted. The group should not take the story about the room with the closed door not having anything in it. That room or closet is usually the one that is loaded with combustible material.

Electrical wiring, heating systems, open flame devices, combustible or hazardous material storage, explosive materials or chemicals, compressed gases, acetylene generators, paint storage, etc., should all come in for careful scrutiny and attention.

One or two men should be assigned to sketch property and buildings with notations made on the sketches for doors, windows, stairs, fire walls, standpipes, sprinklers and control valves or siamese, and any of previously mentioned hazards or other items of special interest. The NFPA "Inspection Manual" will be of much assistance to you in handling this item. These drawings should then be kept in the files at your station for use on Pre-Fire Planning sessions which you have at the fire stations.

EXTERIOR FACTORS TO BE CONSIDERED:

1. A. Distance to nearest hydrants or water supply - Number of feet of hose necessary to reach each building in area - First and second lines.
   B. Number of lines which can be supplied - Gallons per minute available.
   C. Size mains - Hydrants - Flow Pressure-Loop or Dead End systems, etc.

2. Exposures - Buildings on all sides of target building - How fire in target building would affect surrounding buildings - Would it cause a conflagration?

3. Roads and means of access to building and areas - Streets - Alleys - Vacant lots, etc.

4. Where building may be laddered and what length ladders necessary for life saving or fire streams.

5. Nearest Fire Alarm Box or Telephone.

6. Exterior sprinkler - Standpipe - Water Curtain - [illegible] or Siamese.

CPOS 2646

PRE-FIRE PLANNING (contd.)

INTERIOR FACTORS TO BE CONSIDERED:

1. Type of Building Construction:

   A. All masonry
   B. Masonry and Wood
   C. Heavy Timber (Mill Type)
   D. Frame (Wood)
   E. Frame (Metal) with wood or metal covering

2. Life Hazard:

   A. Number of persons working or living in building in daytime.
   B. Number of persons working or living in building during night.
   C. Crippled or bedridden persons on premises.
   D. Places of public assembly - Number of persons building will hold and hours occupied.

3. Means of Entrance or Egress:

   A. Doors - Fire Escapes - Stairways, etc., which would be utilized for life saving.
   B. Do corridors or aisles lead directly to means of egress and are they clear of obstructions.

4. Vertical Openings:

   A. Stairs - Open or enclosed - with or without fire doors - Door open inward or outward - Stairs turn right or left - Are fire doors equipped to close automatically.
   B. Elevator shafts - Dumb Waiter shafts - Incinerator and Trash chutes.
      1. Are they enclosed with fire resistive material and equipped with self-closing metal clad doors?
      2. Condition of shaft - Is trash condition present at bottom?
      3. Do tops of shafts stop or open into attic or do they extend through roof?
   C. Vents and Ducts - See if they are enclosed with fire resistive material and pass through attic or upper floors and through roof. If they stop in attic or upper floors, make special notice for fire spread in these areas.
   D. Distances from Entrances or Building Openings to hazard spots. Estimates or measurements should be made of number of feet of hose needed to reach spots most likely to be involved in fire or to points whereholding lines would be needed for life saving.

5. Attics - Check wiring - Chimneys - Type walls (Fire-stopped or balloon) (Open) - Trash or storage of combustible materials - Check for holes in walls between buildings - Vents - Ducts - Shafts which terminate in attic.

6. Ventilation Possibilities: Skylights - Air Shafts - Elevator and other shafts - Ducts - Stairways - Windows - etc., should be noted for speed and efficiency in ventilation. What properties around target building would be exposed under certain ventilating conditions.

2647

PRE-FIRE PLANNING (contd.)

7. Salvage Possibilities: Is stock off floors on risers or skids - Are floor drains or scuppers marked with overhead markers - Is stock stored with good aisle space and space between walls and stock which will swell from water. Are sprinkler heads clear and stock at proper level below heads. Type of stock which would be most likely to be affected by water and damage easily - Which to be covered with salvage covers first, second, etc.

8. Types of Posts Supporting upper floors: If post of metal - Are they covered with fire resistive material? What kinds of loads are they supporting? If post involved in fire will loads on upper floors cause early collapse?

9. Location of: Main switch boxes - Fuse Box - Gas shutoffs - Water Shutoffs - Oil Shutoffs - Main switches for furnace, air conditioning, blower systems - Furnace room - Hazardous Processes of conditions - Flammable Liquids, etc.

10. Sprinkler systems - Interior and Exterior Standpipes - Interior fire hose, Extinguishers.

11. General Housekeeping: Storage of combustibles - Gases - Flammable Liquids - Chemicals - Acids - Concealed spaces in walls or ceilings - Wall Finishes (Fast burning or fire resistant) Combustible dusts - Materials subject to spontaneous heating - Explosive materials - Oxidizing agents and others.

12. Check principal sources of Ignition Hazards:
    A. Open flames and heaters: Smoking, torches, gas jets, lamps, furnaces, ovens, heaters.
    B. Friction: Hot bearings, rubbing belts, grinding, shredding, picking, polishing, cutting, drilling.
    C. Electricity: Arcs and sparks, including lightning and static, heated resistances.
    D. Chemical reactions, exothermic, endothermic.

FINAL INTERVIEW:

Before leaving the property and the persons who have gone over the buildings or premises with you, be sure and extend the thanks of the men and the department for courtesies shown and for them taking the time to show you around.

Any discussions or suggestions you have made should be reviewed and plans made if another trip is necessary to complete the picture.

We hope that you will try Pre-Fire Planning in your Department and city, town or fire district and know that if tried it will bring you new friends, much knowledge of local conditions and better conditions over a period of time.

PREFACE

The Flight Standards Service of the Federal Aviation Administration has issued this *Airplane Flight Instructor Written Test Guide* to provide information to prospective airplane flight instructors and other persons interested in Federal Aviation Administration certification of flight instructors.

The guide contains information about certification requirements, application procedures, and the required Written test. Its purpose is to guide prospective applicants toward a clear understanding of the requirements, reference material, and tests, and the application and testing procedures. A sample test is presented and explanations of the correct answers are given.

Superseding the *Airplane Flight Instructor Examination Guide* dated 1965, the guide is issued as Advisory Circular No. 61–11A.

AIRPLANE FLIGHT INSTRUCTOR WRITTEN TEST GUIDE

Introduction

This study guide was prepared by the Flight Standards Service of the Federal Aviation Administration to assist applicants who are preparing for the Airplane Flight Instructor Written Test. It was prepared by the same personnel who were responsible for developing the airplane flight instructor written test currently in use.

This guide is not offered as a quick and easy way to obtain the necessary knowledge for passing the written test. There is no quick and easy way to obtain the background of experience, knowledge, and skill that the professional flight instructor should acquire in order to provide the high quality of training necessary to transform today's student into tomorrow's proficient pilot. Rather, the intent of this guide is to define and narrow the field of study, insofar as possible, to the basic knowledge requisite to obtaining a flight instructor certificate.

Certificate Requirements

The general qualifications for an airplane flight instructor certificate require of the applicant a combination of experience, knowledge, and skill. An applicant for a flight instructor certificate with an airplane rating should carefully review the applicable sections of Federal Aviation Regulations Part 61 for detailed information pertaining to this subject.

Type of Written Test

The Airplane Flight Instructor Written Test is necessarily comprehensive because the flight instructor should be knowledgeable in many areas. He should know not only "what" to do and "how" to do it; he should know also "why" a maneuver is performed in a certain order and what the results may be if the maneuver or procedure is not performed properly. It is generally accepted that a pilot with much knowledge but little skill is not adequately equipped for day-to-day flying, but neither is the pilot who is skillful in only the manipulative techniques of flying and lacking in aviation knowledge.

In addition to his aviation qualifications, the flight instructor should be capable and well versed in one highly important area that is not required for any other pilot certificate. The flight instructor should be a teacher. He should have an understanding of the learning processes, the basic teaching principles, and the general application of these principles to teach his students effectively. There is much truth in the saying, "If there is no learning, there is no teaching."

The airplane flight instructor written test is divided into two sections: Section I "Fundamentals of Flight Instruction" and Section II "Performance and Analysis of Flight Training Maneuvers." A detailed outline of the subject areas covered in each section appears later in this guide.

The time required for the test is approximately 4 hours. Test items are of the objective, multiple-choice type, and each can be answered by the selection of a single item as the correct choice. This method conserves the applicant's time, the scorer's time, and eliminates any element of individual judgment in determining grades.

Taking the Written Test

In addition to being an exercise in the application and use of aeronautical knowledge, a test is also an exercise in communication since it involves the use of written language. Communication between individuals through the use of such abstract symbols as words is indeed a complicated process; so complicated, in fact, that at times communication may

either break down or mislead if care is not exercised. The same word often means different things to different people. Carefully read the information and instructions.

Always bear in mind the following facts when you are taking the test:

1. The test items are not trick questions. Each statement means exactly what it says. Read each question and possible answer carefully, but do not look for hidden meanings. The statement does not concern exceptions to the rule; it refers to the general rule.

2. First, carefully read the test item before you look at the answers listed below it. Be sure that you understand what the question asks. Then decide what the correct answer should be or work out the problem to obtain the answer. Finally, look through the list of alternate answers or phrases and select the one that says the same thing as your answer. Be sure that the one you select answers the question completely.

3. Only one of the alternate answers given is completely correct. The others may be answers that result from incorrect procedure (in a problem, for example) or from lack of knowledge pertaining to the test item, or from popular misconceptions. Understand the question and then select the answer you consider to be the best.

4. If you find that you have considerable difficulty with a particular test item, do not spend too much time on it, but continue with the test and answer those questions which are less difficult. Then go back and reconsider the test items you have passed over. This procedure will enable you to use the total time available to maximum advantage in demonstrating your knowledge and understanding of the subject.

RECOMMENDED STUDY MATERIALS

The applicant for the Airplane Flight Instructor rating will find the publications listed below helpful to him in his preparation for the written test.

The list identifies source material essential to preparing for the test, but does not include all available material on the subjects. Other excellent textbooks, audiovisual training aids, and instruction materials useful in preparing for the test are available at bookstores and libraries.

It is the responsibility of each applicant to obtain the study materials appropriate to his needs.

Airman's Information Manual. This publication has been designed as a pilot's operational manual for use primarily within the conterminous United States. It is divided into three basic parts, each of which may be purchased separately.

PART 1—BASIC FLIGHT MANUAL AND ATC PROCEDURES. (Annual Subscription: $2.00 domestic; $2.50 foreign.) This part is issued quarterly and contains basic fundamentals required to fly in the National Airspace System; adverse factors affecting Safety of Flight; Health and Medical Facts of interest to pilots; Emergency Procedures, and other topics.

PART 2—AIRPORT DIRECTORY. (Annual Subscription: $2.00 domestic; $2.50 foreign.) This part is issued semiannually and contains a Directory of all Airports, Seaplane Bases, and Heliports in the conterminous United States, Puerto Rico, and the Virgin Islands which are available for transient civil use. It includes all of their facilities and services, except communcations, in codified form.

PARTS 3 and 3A—OPERATIONAL DATA AND NOTICES TO AIRMEN. (Annual Subscription: $9.00 domestic; $11.25 foreign.) Part 3 is issued every 28 days and includes an Airport/Facility Directory listing all major airports with communications; a tabulation of Air Navagation Radio Aids and their assigned frequencies, a Sectional Chart Bulletin, which updates sectional charts cumulatively; and other information. Part 3A is issued every 14 days and contains Notices to Airmen considered essential to the safety of flight.

Private Pilot's Handbook of Aeronautical Knowledge, AC 61–23 ($2.75). This text on basic aeronautical knowledge was designed to meet the needs of the private pilot. However, it should be useful as a basic text for reference and for review of most aviation fundamentals, many of which are directly related to questions on the Airplane Flight Instructor Written Test.

Aviation Weather, AC 00–6 ($2.25). Issued jointly by the U.S. Weather Bureau and the Federal Aviation Administration, this publication explains, in nontechnical language, the fundamentals of weather behavior in relation to flying, using many illustrations. It explains the aviation weather services offered to the pilot for his safety in flying and gives information on many other phases of meteorology.

Flight Instructor's Handbook, AC 61–16 (60¢). This revised handbook is one of the primary sources of information and guidance for pilots preparing for the flight instructor certificate and is also valuable as a reference text for certificated flight instructors. It is basically a book which deals with accepted theories and practices applicable to teaching and the learning process. As such, it is the primary reference text when preparing for the "Fundamentals of Instruction" section of the Flight Instructor's Written Test. It also deals with selected topics of aerodynamics which will be useful to the flight instructor, gives a comprehensive outline of flight training maneuvers currently in use, and includes a sample Private Pilot Flight Syllabus.

8285 2657

Flight Training Handbook, AC 61–21 (70¢). This text deals with basic flight information such as load factor principles, weight and balance, and related aerodynamic aspects of flight, as well as principles of safe flight. The balance of the book provides information and direction in the introduction and performance of training maneuvers. Thus it serves as a text for student pilots, pilots improving their qualifications or preparing for additional ratings, and flight instructors who are teaching.

Federal Aviation Regulations

PART 1—DEFINITIONS AND ABBREVIATIONS (25¢). This Part contains all needed definitions, abbreviations, symbols, and rules of construction which apply to all Parts of the Federal Aviation Regulations.

PART 61—CERTIFICATION: PILOTS AND FLIGHT INSTRUCTORS (60¢). The applicant is responsible for the items in this Part which fall within the scope of knowledge required for his certification as a flight instructor.

PART 91—GENERAL OPERATING AND FLIGHT RULES (70¢). It is imperative that the applicant be familiar with all the information in this Part except that which pertains to instrument flight.

PART 23—AIRWORTHINESS STANDARDS-NORMAL, UTILITY, AND ACROBATIC CATEGORY AIRPLANES (65¢). Certain sections of this Part will prove most useful as a source of detailed information on the requirements pertaining to aircraft characteristics, performance, and operation.

National Transportation Safety Board, Safety Investigation Regulations, Part 430 (5¢). This NTSB publication deals with procedures required in dealing with accidents and lost or overdue aircraft in the United States and outlying areas.

Airplane Flight Manuals and Owners Manuals. Aircraft manufacturers issue manuals for each aircraft model. These may be obtained from individual aircraft manufacturing companies or from local dealers and distributors.

Plane Sense, AC 20–5A (Free). This booklet helps to acquaint the prospective airplane owner with some fundamentals of owning and operating an airplane. Upon request, it is free from the Federal Aviation Administration Washington, D.C. 20590.

Facts of Flight, AC 00–4 (50¢). This publication explains in nontechnical language why an airplane flies; the effect of the controls; stalls and spins; facts about airplane structure and engine operation; and proper technique in takeoff, cruising, and landing.

Path of Flight, AC 00–5 (70¢). An illustrated publication for the student and novice pilots, it contains practical information about navigation of aircraft, radio communication, radio aids, and flight planning.

Realm of Flight, AC 00–3 (75¢). Written for the private pilot, this is a condensed elementary text on weather characteristics affecting flying. Many color pictures are included to illustrate atmospheric pressure, clouds, winds, fronts, and other weather phenomena.

VFR Pilot Exam-O-Grams. Dealing with selected topics of particular importance to safety in flight operations, these précis provide concise information on the specific subjects which pilot tests have indicated need clarification to correct common mistakes, misconceptions, and lack of information. A list of the currently available Exam-O-Grams appears in the Appendix. They are available free of charge from:

FAA Aeronautical Center
Flight Standards Technical Division
Operations Branch, AC–240
Post Office Box 25082
Oklahoma City, Okla. 73125

How To Obtain Study Materials

All study materials listed above except *Airplane Flight Manuals or Owner's Manuals, Plane Sense,* and *VFR Pilot Exam-O-Grams* may be obtained by remitting check or money order to:

Superintendent of Documents
U.S. Government Printing Office
Washington, D.C. 20402

In many instances, these publications may also be obtained at airports or bookstores.

NOTE: The items listed were available at the time this publication went to press.

2658

STUDY OUTLINE FOR THE AIRPLANE FLIGHT INSTRUCTOR WRITTEN TEST

SECTION I. FUNDAMENTALS OF FLIGHT INSTRUCTION

A. PRINCIPLES OF TEACHING AND LEARNING

1. *How People Learn.*

a. Perception—Understand its role in relation to learning and the important factors which affect a student's perception, such as—

(1) Individual mental, emotional, and physiological characteristics.

(2) Needs and requirements.

(3) Goals and values.

(4) Self-concept.

(5) Time and opportunity to perceive.

(6) The element of threat.

b. Insight—Understand its relationship to perception and the instructor's role in—

(1) Cultivating receptiveness to new experiences.

(2) Organizing demonstrations, explanations, and directed student practice.

(3) Pointing out related perceptions as they occur.

(4) Supervising the "trial and error" process.

(5) Assisting the student to group associated perceptions into meaningful wholes or "blocks" of learning.

c. Motivation—Understand its dominant role in relation to student progress and ability to learn

(1) Types of motivation.

(a) Negative motivation.

(b) Positive motivation.

(c) Tangible motivation.

(d) Intangible motivation.

(2) Use of factors which affect motivation.

(a) Gain or reward.

(b) Comfort and security.

(c) Favorable self-image.

(d) Group approval.

(e) Short and long-range goals.

(f) Praise.

(g) Criticism.

d. Obstacles to learning—Understand the effect of each of the following on the learning process and how they may be modified or eliminated

(1) Self-consciousness.

(2) Antagonism or feeling of unfair treatment.

(3) Impatience.

(4) Worry or lack of interest.

(5) Physical discomfort, fatigue, and illness.

(6) Apathy fostered by poor instruction.

(7) Fear, anxiety, and timidity.

(8) Lack of confidence.

(9) Airsickness.

e. Habits and transfer—Understand the influence of perceptions and insight on the development of performance habits and the influence of such habits in subsequent learning and transfer of learning.

(1) The importance of the formation of correct habit patterns.

(2) The importance of habit patterns in aircraft control.

(3) The promotion of transfer of learning through use of the flight syllabus.
(4) Positive transfer.
(5) Negative transfer.
(6) The influence of the "building block" technique of instruction in habit development.

2. *Levels of Learning.* Understand the progressive levels of learning as exemplified by the "building block" concept.
   a. Rote performance.
   b. True understanding.
   c. Correlation of previous learning, understanding, and skill with new tasks, problems, techniques, and procedures.
3. *Rates of Learning.*
   Have a knowledge and understanding of—
   a. The characteristics of a typical learning curve.
      (1) Initial learning rate.
      (2) Slumps or plateaus and their causes.
      (3) Reversals and their causes.
   b. The role of memory and the effect of forgetting in the achievement of satisfactory student progress.
      (1) Relationship between memory and habit patterns.
      (2) Usefulness of drill, recitation, and quizzing.
      (3) Continued usage, practice, and application.
   c. Significant principles which reinforce memory.
      (1) Praise.
      (2) Association.
      (3) Favorable attitude.
      (4) Learning with all the senses.
      (5) Meaningful repetition.
4. *Common Misconceptions About Learning.*
   a. Fear is the best motivator.
   b. Making it easy to learn is contrary to the principles of sound teaching.
   c. Pictures, illustrations, and diagrams are, per se, more effective than written or verbal presentations of information.
   d. The greater the experience, the better the performance.
   e. The impersonal approach is more effective than the friendly attitude in teaching.
   f. Competition is the key to successful learning.
   g. Frustration and failure are essential to learning.

B. HOW TO GUIDE THE LEARNING PROCESS

1. *Plan the Instructional Activity.*
   a. Establish clear objectives or goals.
   b. Identify the block of learning.
   c. Provide for student participation.
   d. Diagnose student ability.
   e. Use a teaching sequence that "makes sense."
   f. Work from the known to the unknown.
   g. Work from the easy to the difficult.
   h. Plan so the student will see the necessity and logic of each succeeding step.
2. *The Flight Training Syllabus.*
   a. Arrange for efficient sequence in "blocks" of training.
   b. Use syllabus as a guide.
   c. Keep flexibility in teaching procedures.
3. *The Lesson Plan.*
   a. Lesson planning is essential to teaching success.
   b. Items to include in lesson plan—
      (1) Lesson objectives.
      (2) Elements involved in satisfactory fulfillment of lesson objectives.
      (3) Allocation of time available.
      (4) Equipment needed.
      (5) Activity required of the instructor.
      (6) Activity required of the student.
      (7) Evaluation of student performance.
4. *The Flight Instruction Breakdown.*
   a. Useful in preparing meaningful lesson plans.

2659

2660

b. Useful for guidance in offering effective instruction.
c. Requires personal analysis of maneuver.
d. Requires personal analysis of proposed procedure for teaching maneuver.

5. *Presentation of the Instruction Material.*
a. Establish atmosphere of cooperation.
b. Explain, demonstrate, and direct.
c. Require student participation.
d. Keep goal in sight.
e. Be brief, clear, and to the point in explanations.
f. Use analogies as link between known and unknown.
g. Question technique: use and importance.
h. Deal with the individual needs of both poor students and apt students.
i. Use training aids.

6. *Performance.*
a. Usually integrated with presentation.
b. Require discipline.
c. Make it realistic.
d. Guide student efforts.
e. Progress from easy to difficult.
f. Relate to previous explanations and practice.
g. Provide adequate practice but control blind "trial and error."
h. Understand factors relating to length and frequency of practices.
i. Use of briefings and critiques.
j. Skill versus knowledge.
k. Role of repetition in learning and retention.

7. *Evaluate the Performance.*
a. An integral part of each lesson.
b. Establishes need for selective reteaching or review.
c. Acquaints student with his progress.
d. Should include evaluation of things previously learned.
e. Should be based on standards established by the training syllabus.

C. ANALYSIS OF EFFECTIVE TEACHING METHODS AND TECHNIQUES

1. *The Four Basic Steps in the Teaching Process.*
a. Preparation (See Section IB, "How to Guide the Learning Process").
b. Presentation.
(1) Telling or explaining—the lecture method
(a) Does not permit student participation.
(b) Can be combined with other methods for greater effectiveness.
(2) Techniques of discussion
(a) Develop cooperative spirit.
(b) Clarify problems.
(c) Encourage participation.
(d) Avoid dominating discussion.
(e) Summarize frequently.
(3) Demonstration or showing
(a) Usually combined with explanations.
(b) Makes explanations concrete.
(c) Aids student understanding.
(d) Saves learning time.
(e) Effective with both large and small groups.
(f) Gives student overall perspective.
(g) Appeals to several senses.
(h) Has dramatic appeal.
c. Doing—trial and practice
(1) Essential to the learning process.
(2) Constitutes student's activity based on instructor's preparation and presentation.
(3) Requires careful guidance and correction.
(4) Requires student and instructor evaluation.
(5) Concentrate on strengthening weak points of performance.
d. Review and evaluation
(1) Review organizes thinking.
(2) Review develops understanding of basic principles.

2661

(3) Help the student to see relationships.
(4) Evaluations are measures of the success of a teaching program.
(5) Test for both understanding and performance.
(6) Characteristics of good evaluation.
  (a) Validity—does it measure what it is supposed to measure?
  (b) Reliability—are the results consistent?
  (c) Objectivity—does it limit the undesirable errors introduced by personal judgment in grading?
  (d) Differentiation or discrimination—does it identify small but significant differences in achievement?
  (e) Comprehensiveness—does it provide adequate sampling of the skill or proficiency being graded?
(7) Common techniques of evaluation
  (a) Oral and written quizzes.
  (b) Demonstrations of ability.
  (c) Examination and tests.

D. HELPING STUDENTS TO LEARN—THE FLIGHT INSTRUCTOR'S ROLE

1. *Be a Professional*
  a. Train and prepare.
  b. Follow a program of self-improvement.
  c. Adhere to ethical standards.
  d. Be of real service.
  e. Believe in your work.
  f. Maintain a positive attitude—be sincere, enthusiastic, friendly, and patient.
  g. Be proficient as a pilot.
  h. Be proficient as a teacher.
2. *The Instructor-Student Relationship*
  a. Gain the student's confidence.
  b. Appreciate the student's problems.
  c. Assess the student's personality, thinking, and ability.
  d. Allow for individual differences.
  e. Keep student aware of progress.
3. *Safety Practices*
  a. Practice what you preach
    (1) Use the checklists.
    (2) Observe established safety practices.
    (3) Observe regulations.
    (4) Teach respect for limitations of self and equipment.
4. *Use of Training Aids*
  Choose with care—
  a. Models.
  b. Charts, diagrams, and performance tables.
  c. Audiovisual courses.
  d. Programmed instruction.
  e. "Handees" (gestures and improvisations).

E. MAINTAIN STUDENT INTEREST AND MOTIVATION

1. *Motivation—Basic to All Learning*
  a. Utilize interests noted during analysis of the student.
  b. Direct and control student's attention.
  c. Appeal to all the student's senses.
  d. Contrive interesting experiences.
  e. Teach from the known to the unknown.
  f. "Watch your language"—explain technical terms.
  g. Emphasize the positive.
  h. Utilize the incentive provided by rewards.

F. IMPORTANT AEROMEDICAL INFORMATION

1. *The General Health Factor.*
2. *Specific Aeromedical Factors—Their Symptoms and Control*
  a. Fatigue, boredom, inattention.
  b. Hypoxia.
  c. Alcohol.
  d. Drugs.
  e. Vertigo.
  f. Carbon monoxide.
  g. Vision.
  h. Middle ear discomfort.
3. *Scuba Diving*—"Airman's Bends."
4. *Psychological Factors in Flying*

2662

a. Anxiety.
b. Normal and abnormal reactions to stress.
c. The "difficult" student.
d. The seriously abnormal student.

G. FLIGHT INSTRUCTOR RESPONSIBILITIES

1. *Foster Student Learning*
   a. Know the objective.
   b. Devise a plan of action.
   c. Create a positive instructor-student relationship.
   d. Present information and guidance effectively.
   e. Transfer responsibility to the student as he learns.
   f. Evaluate teaching effectiveness through evaluation of student's learning and proficiency.
2. *Instruction of Student Pilots*
   a. Provide adequate instruction.
   b. Require an adequate standard of performance.
   c. Give adequate supervision.
   d. Endorse student pilot certificates.
   e. Endcrse student logbooks.
   f. Maintain adequate records.
3. *Flight Test Recommendations.*
4. *Aircraft Checkouts*
   a. Use appropriate guides.
   b. Be fully qualified.
5. *Refresher Training*
   a. Know the objectives.
   b. Know the standards.
6. *The Flight Instructor Image*
   a. Be sincere.
   b. Accept the student as he is.
   c. Maintain professional appearance and habits.
   d. Avoid objectionable language.
   e. Develop and maintain a calm, thoughtful, and disciplined demeanor.

SECTION II. THE PERFORMANCE AND ANALYSIS OF FLIGHT TRAINING MANEUVERS

A. AERODYNAMICS. Have a knowledge and understanding of—

1. *Aerodynamic terms and definitions.*
2. *Airplane loading*
   a. Weight and balance and flight performance.
   b. Effects of load on airplane structure.
   c. Effects of loading on stability and controllability.
   d. Load factor principles.
      (1) Load factors and stalling speeds.
      (2) Load factors and flight maneuvers.
3. *Forces Acting on an Airplane in Flight.*
4. *The Airplane's Axes of Rotation.*
5. *Functions of the Control Surfaces and Trim Tabs.*
6. *Use of Flaps*
   a. Effects on flight performance.
   b. Effects on stability.
7. *Angle of Attack*
   a. In stalls.
   b. As an index of performance.
8. *Airspeed*
   a. Control effectiveness.
   b. Maximum performance speeds.
      (1) Slow flight.
      (2) Cruise.
      (3) Best rate-of-climb (V_y).
      (4) Best angle-of-climb (V_x).
      (5) Relationship between speed, angle of bank, and rate of turn.
9. *Turns*
   a. Forces acting on an aircraft in a normal turn.
   b. Changes of lift in a turn.
   c. Increase of drag in a turn.
10. *Ground Effect*
    a. As a factor in takeoffs.
    b. As a factor in landings.
    c. Its use in emergencies.
11. *Torque and "P" Factor*
    a. Aircraft rigging.
    b. Asymmetrical loading of the propeller.
    c. Action of the spiral slipstream.
    d. Gyroscopic action of the propeller.
    e. Torque reaction.
12. *Controllable Propellers*
    a. How a propeller works.
    b. Purpose of controllable propellers.
    c. Operation of controllable propellers —The relationship between mani-

2663

fold pressure, RPM, and Brake Mean Effective Pressure (BMEP).

B. FLIGHT TRAINING MANEUVERS AND PROCEDURES

1. *Know How and When to Introduce Maneuvers and Procedures* (Item 5 below).
2. *Know the Correct Technique for the Maneuvers and Procedures.*
3. *Be Able to Recognize and Analyze Common Student Errors.*
4. *Be Familiar with Effective Methods of Correcting Student Errors.*
5. *Know the Required Maneuvers and Procedures*
   a. Preflight (including check of airplane documents and records), starting, warm-up, taxi, before takeoff, inflight, and postflight checks and procedures.
   b. Use of radio for voice communication.
   c. Straight-and-level flight, turns (including slips and skids), and confidence maneuvers.
   d. Climbs and glides (including powered descents).
   e. Ground track maneuvers
      (1) "S" turns across a road.
      (2) Turns about a point, including 720° steep turns.
      (3) Rectangular courses.
      (4) Traffic patterns.
   f. Stalls, stall recoveries, and flight at minimum controllable speeds.
   g. Takeoffs and landings
      (1) Normal.
      (2) Crosswind.
      (3) Short, soft and rough-field.
      (4) Slips, and slips to a landing.
      (5) Downwind landings.
      (6) Power approaches.
      (7) Touch and go landings.
      (8) Wheel landings (tail-wheel type airplanes), stall landings (nosewheel-type airplanes).
      (9) Go-arounds.
      (10) Emergencies, including those applicable to multiengine aircraft.
      (11) Solo flight.
   h. Eights on pylons (shallow and steep).
   i. Chandelles and lazy 8's.
   j. Steep turns (including 720° power turns).
   k. Constant radius power-off spirals.
   l. Spins.
   m. Post solo emergencies.
6. *Cross-country Flying*
   a. Planning.
   b. Pilotage.
   c. Dead reckoning.
   d. Use of radio aids. (See Section E, "Use of Radio.")
   e. Cross-country emergencies.
      (1) Lost.
      (2) Engine failure.
      (3) Adverse or marginal weather.
      (4) Icing.
      (5) Loss of or restriction to visual references.
      (6) Imminent fuel exhaustion.

C. THE INTEGRATION OF INSTRUCTION IN VISUAL AND INSTRUMENT FLYING.

1. *Flight Instructor Qualifications.*
2. *Objectives.*
   a. Development of habit patterns.
   b. Accuracy of flight control.
   c. Operating efficiency.
   d. Emergency capability.
3. *Procedures.*
4. *Safety Precautions.*

D. FUNDAMENTALS OF INSTRUMENT FLIGHT

1. *The Three Major Components of Attitude Instrument Flight*
   a. Instrument coverage (cross-check).
   b. Instrument interpretation.
   c. Aircraft control.
2. *Instrument Characteristics*
   a. Attitude indicator (artificial or gyro horizon).
   b. Heading indicator (directional gyro or gyro compass).
   c. Vertical speed indicator.
   d. Turn-and-slip indicator.
   e. Airspeed indicator.
   f. Altimeter.
   g. Magnetic compass.

2664

3. *How to determine Attitude by Instrument Indications.*
4. *How to Recognize Incorrect Use of Controls by Flight Instrument References.*
5. *The Relationship Between Rate of Turn, Radius of Turn, True Airspeed, and Angle of Bank.*
6. *Standard Rate Turns.*
7. *Physiological Reactions and Sensory Illusions.*
8. *Required Maneuvers*
   a. Straight and level.
   b. Normal turns of at least 180°, left and right, to within 20° of a preselected heading.
   c. Shallow climbing turns to a predetermined altitude.
   d. Shallow descending turns at reduced power to a predetermined heading.
   e. Recovery from the approach to a climbing stall.
   f. Recovery from the start of a power-on spiral.

E. USE OF RADIO—Understand the basic characteristics, operations, frequency spectrum, advantages, and limitations of—

1. *VHF Communications Equipment*
   a. The "line-of-sight" range of transmissions.
   b. Understand how to utilize VHF/DF (direction finding) service and radar assistance from ground stations.

2. *VOR Equipment*
   a. Understand the meaning of the radio class designations of "H", "L", and "T" for VOR/VORTAC/TACAN stations.
   b. Know the components of the VOR receiver.
   c. Understand a radial as a line of magnetic bearing extending from a VOR station.
   d. Understand how to determine your approximate position relative to the station by interpreting the setting of the bearing selector, the position of the LEFT-RIGHT Needle, and the indication of the TO-FROM indicator.
   e. Understand the use of VOR for time and distance checks and for off-course navigation.
   f. Understand the methods of checking VOR receiver accuracy.
3. *L/MF Range and ADF Equipment*
   Understand—
   a. How to determine the magnetic directions of the four legs of L/MF radio ranges and the relative positions of the "A" and "N" quadrants.
   b. How to interpret bi-signals and on-course and off-course signals.
   c. The importance of the station identification signal in quadrant identification and orientation problems.
   d. How to interpret bearing information when using ADF.
   e. The use of ADF in checking time and distance to radio stations.
   f. Tracking outbound and inbound on ADF.
   g. Operational characteristics and precautions to observe in use of L/F radio equipment.

F. USE OF PILOT INFORMATION PUBLICATIONS

1. *Airman's Information Manual*—Know how to use and interpret the data contained in this important publication, such as—
   a. Air navigation radio aids (NAVAIDS).
   b. Airport and air navigation lighting and marking aids.
   c. Altimetry.
   d. Good operating practices.
   e. Radar.
   f. Radiotelephone phraseology and techniques.
   g. Safety of flight.
   h. Weather.
   i. ATC operations and procedures.
   j. Flight data and special operations.
   k. Notice to Airmen (NOTAMS).

l. Airport directory.
m. Airport/Facility Directory.

2. *Airplane Flight Manual and Owner's Manual*—As applicable to the airplane(s) in the instruction program, understand the material in these manuals and how to use it.
   a. Know how to consult the weight and balance data to determine that the aircraft is properly loaded. Know how to compute empty weight, useful load, and gross weight. Know how to compute moments from weights and center of gravity arms.
   b. Know the grade and quantity of fuel and oil required.
   c. Know flight load factor limitations and airspeed limitations.
   d. Be able to use performance charts as required for:
      (1) Takeoff data.
      (2) Climb data.
      (3) Landing distance data.
      (4) Cruise performance data (cruise power settings, approximate true airspeeds, fuel consumption rate).
   e. Be able to use tables such as:
      (1) Stall speed versus angle-of-bank table.
      (2) Airspeed calibration table.

3. *Federal Regulations Governing Aviation*
   The Airplane Flight Instructor should be familiar with the following National Transportation Safety Board Regulations and Federal Aviation Regulations:
   a. National Transportation Safety Board, Safety Investigation Regulations, Part 430.
   b. Federal Aviation Regulations
      (1) Part 1, "Definition and Abbreviations."
      (2) Part 61, "Certification: Pilots and Flight Instructors."
      (3) Part 91, "General Operating and Flight Rules."

G. AIRFRAME AND POWERPLANT—Have a working knowledge of—

1. Aircraft structures.
2. Airframe components and control surfaces.
3. Fuel and fuel systems.
4. Oil and oil systems.
5. Electrical system fundamentals.
6. Reciprocating engine principles and components.
7. Carburetion and fuel injection.
8. Ignition.
9. Propellers.
10. Engine instruments.

H. OTHER AREAS OF IMPORTANCE

1. *The Altimeter*
   a. Know the effect of nonstandard temperature and pressure on the indications of the altimeter.
   b. Understand how to apply altimeter settings to the Kollsman window of the altimeter.
   c. Understand how to obtain the pressure altitude.
   d. Be able to interpret the indications of the altimeter at all altitudes (including altitudes above 10,000 feet).

2. *The Airspeed Indicator*
   a. Know the eight airspeed ranges and limitations that are reflected by the standard marking system on the face of the airspeed indicator (white, green, and yellow arcs, and the red line).
      (1) Flap operating range.
      (2) Normal operating range.
      (3) Caution range.
      (4) Power-off stalling speed with the wing flaps and the landing gear in the landing position (V_{SO}).
      (5) Power-off stalling speed. "Clean"—wing flaps and landing gear retracted (V_{S_1}), if retractable-gear type.
      (6) Maximum flap extended speed (V_{FE}).
      (7) Maximum structural cruising speed (V_{NO}).
      (8) Never-exceed speed (V_{NE}).
   b. Know and understand the reason for other pertinent airspeed limitations such as the design maneuvering speed (V_A).

2666

3. *Aircraft Stability*—Understand both static and dynamic stability.

4. *Meaning of Colored Lights at an Airport.*
   a. Runway.
   b. Taxiway.
   c. Threshold.
   d. Beacon.
   e. Visual approach slope indicator.
   f. Nonstandard traffic light (controlled airports).
   g. Obstruction.

5. *Special Procedures for Multiengine Instruction.* Understand the importance of—
   a. Minimum control speed (V_{MC}) for single-engine operation.
   b. Proper use of single-engine best angle of climb speed and best rate of climb speed (single-engine V_X and V_Y).
   c. Maneuvers and standards stipulated in *Multiengine Airplane Class or Type Rating Flight Test Guide,* AC No. 61–4A.

6. *Understand the Special Procedures for Seaplane Instruction.*

7. *Understand and Be Able to Use Pertinent Charts,* such as—
   a. Density altitude charts.
   b. Load factor chart.
   c. Oxygen duration charts.

8. *Safe Flying Practices.* Have a thorough understanding of
   a. Density altitude and its effects on aircraft performance
      (1) Understand that density altitude INCREASES with a decrease in pressure, increase in temperature, or an increase in relative humidity.
      (2) Understand that if density altitude increases, aircraft performance DECREASES.
   b. Carburetor icing
      (1) Symptoms in aircraft with fixed-pitch propellers and with constant-speed propellers.
      (2) Use of carburetor heat.
   c. Know the effects of snow, ice, and frost on an airfoil, and realize the importance of their removal prior to flight.
   d. Dangers associated with aircraft wake turbulence, i.e., wing-tip vortices; propeller, jet engine, and helicopter rotor wash—
      (1) Conditions and circumstances most conducive to such turbulence.
      (2) How to avoid these dangers.
      (3) Procedure to use if inadvertently encountered.
   e. Fuel contamination
      (1) Causes.
      (2) Precautions to take.

SAMPLE TEST

The following test items are only samples to indicate the general form of those used in the actual test. They are included for one purpose—to familiarize you with the type of test items you may expect to find on the FAA tests. Ability to answer these sample items *does not* indicate that you are fully prepared to take the test since all topics on which you will be tested are not included.

You should concentrate on the section of this study guide entitled "Study Outline for the Airplane Flight Instructor Written Test." A knowledge of all the topics mentioned in this outline—not just the mastery of the sample test items—should be used as the criterion for determining that you are properly prepared to take the FAA written test. Proper preparation requires considerable time, effort, and the guidance of a competent instructor.

Correct answers to the sample test items, along with an explanation of each test item, are on pages 20 through 25. In some sample test items reference will be made to certain illustrations. These illustrations will be found in the Appendix of this guide. These are representative of illustrations which may be found in the written test and with which the applicant should be familiar.

SECTION I. FUNDAMENTALS OF FLIGHT INSTRUCTION

1. In a good flight curriculum, the presentation of maneuvers should be arranged—
   1—In the order in which they are used in normal flight.
   2—In groups or stages to systematize flight instruction.
   3—So that each successive maneuver is less difficult than the last.
   4—So that each teaches an extension of the principles of previous ones.

2. On which of the following is the teaching success of a flight instructor considered to be most dependent?
   1—Personality of the instructor.
   2—Presentation by the instructor.
   3—Flying ability and flight experience.
   4—Proper planning of lessons.

3. Motivation is a key factor in learning. In properly motivating students, a flight instructor should remember that—
   1—Students are innately able to evaluate their proficiency and rate of progress and will instinctively tend to arrive at correct self-concepts if properly motivated.
   2—It is best to emphasize long range goals more than short range goals.
   3—Positive motivations are characteristically more effective than negative motivations.
   4—All of the above statements are considered true.

4. Worry and emotional difficulties which are sometimes associated with flight training are usually a result of—
   1—Personality problems of the student affected.
   2—Inadequacies in the training course or flight instructor.
   3—Personality conflicts between student and instructor.
   4—The type of maneuvers, or the phase of training with which the student is concerned at the time the difficulties arise.

5. The flight instructor's first step in teaching is to—
   1—Gain the student's confidence.
   2—Determine whether the student really wants to learn to fly.

2668

3—Teach the student to fly straight and level.

4—Require the student to complete a short verbal or written quiz to test his ability to assimilate instruction.

6. If a student shows slow progress in learning to perform normal landings because of lack of confidence, his flight instructor should—

1—Continue the instruction on the landings but in a more energetic manner so that the student will apply himself with greater diligence.

2—Use praise to a greater extent after each landing attempt.

3—Assign him goals that are less difficult.

4—Point out the student's errors by exaggerated demonstrations of the errors.

7. A student who has been very quick to absorb instruction and has made few mistakes, suddenly begins to perform poorly during his dual instruction flights. The instructor correctly analyzes this poor performance to be a result of student overconfidence. The proper corrective action by the instructor would be to—

1—Lower the standard of performance expected by the student.

2—Demand greater effort from the student by raising the standard of performance on each lesson.

3—Praise the student only when he deserves it.

4—Do nothing, as this phase in learning is normal for this type of student and will correct itself in time.

8. The integration of instruction in aircraft control, through the use of outside visual references and through use of flight instruments only—

1—Tends to inhibit student progress if introduced prior to solo flight.

2—Is best accomplished during dual cross-country flights.

3—Will improve a student's precision, efficiency, and safety in flight.

4—Prepares a student pilot for extended operations in difficult weather situations.

9. The most effective level of communication (teaching) normally occurs when an instructor provides the student with—

1—All facts and knowledge pertaining to a learning problem.

2—Appropriate facts and knowledge in a manner which assures that the student receives it accurately.

3—Appropriate facts and knowledge in a manner which assures student understanding.

4—Facts and knowledge in such a way that his behavior is properly affected.

10. In what way is a negative self-concept likely to affect a student? A negative self-concept may introduce psychological factors which—

1—Can affect unfavorably a student's ability to receive perceptions and inhibit his ability to perform after perceiving.

2—Can affect unfavorably a student's ability to receive perceptions but, once he perceives, will have no effect on his ability to do or perform.

3—Will have negligible effect on a student's ability to receive perceptions or on his ability to perform.

4—Will result in a student being less "on the defensive."

11. The use of training films, slides, charts, models, mockups, etc. is—

1—Generally considered good teaching practice because their use lightens the load on the flight instructor.

2—Justified only if the students feel that they are useful and the instructor has time to include them in the course.

3—Justified when they are used as aids to teaching and are utilized in a meaningful manner along with other teaching methods.

4—Justified if they have been approved by the Federal Aviation Administration.

12. Criticism of a poor or unsatisfactory flight performance—

1—Is the most dependable method of forcing flight students to apply themselves more diligently.

2669

2—Has no place in a good flight instruction program.
3—May completely subdue and destroy the initiative of a timid student.
4—Will cause reactions which the good instructor can utilize to determine if the student is highly motivated.

13. Lesson plans or course syllabuses should be—
1—Followed exactly if maximum benefit is to be derived from their use.
2—Adapted to the learning situation and changed when necessary.
3—Used primarily by inexperienced instructors.
4—Used primarily by those instructors who must teach students who have already received part of their flight training from another instructor.

14. The responsibilities of today's flight instructor are very real and very complex. The instructor can best live up to these responsibilities by—
1—Requiring a high standard of proficiency in his students.
2—Establishing his effectiveness as an instructor on the basis of an objective evaluation of his own flying proficiency.
3—Discouraging from further instruction those students who do not have a natural physical and mental capacity to fly.
4—A keen analysis of his students and a deep personal interest in their welfare.

15. The four basic steps in effective instruction are—
1—Straight and level, climbs, glides, and turns.
2—Preflight, air work, traffic patterns, and emergencies.
3—Preparation, explanation and demonstration, trial and practice, and review and evaluation.
4—Analysis, explanation, performance, and practice.

SECTION II. PERFORMANCE AND ANALYSIS OF FLIGHT TRAINING MANEUVERS

16. Prior to takeoff, a pilot sets his sensitive altimeter to the current altimeter setting at the airport from which the takeoff is being made. His altimeter then reads the same as the one illustrated in Figure 3 in the appendix. Assume that the terrain along the route which the pilot will be flying has the same elevation as the airport. Which of the following altitudes would satisfy FARs for VFR operations if the route of flight has a magnetic course of 135°?
A. 4,500 feet MSL.
B. 5,000 feet MSL.
C. 7,500 feet MSL.
1—A only.
2—B only.
3—B and C only.
4—A, B, and C.

17. A pilot is involved in a landing accident due to the inflight failure of an engine component of a *light airplane* (12,500 pounds or less). Following the accident, he wishes to check the appropriate Regulation to determine the procedure he should follow. Which of the following correctly gives the Regulation he should check and the complete procedure he should follow if the damage is considered as substantial?
1—National Transportation Safety Board, Safety Investigation Regulations, Part 430. He must notify the NTSB immediately and within 10 days file a report of the accident with NTSB.
2—Federal Aviation Regulations, Part 61. He must report the accident immediately to the NTSB.
3—Federal Aviation Regulations, Part 91. He has 7 days in which to report the accident to the Federal Aviation Administration if the damage to the engine is more than $100.
4—National Transportation Safety Board, Safety Investigation Regulations, Part 430. He must notify either the FAA or the NTSB of the accident within 2 weeks of the occurence.

18. Referring to the excerpt from the *Airman's Information Manual* (see Figures 32 through 35 in the Appendix), you examine information for the following airports:
A. Tulsa International Airport, Tulsa, Okla.

2670

B. Will Rogers World Airport, Oklahoma City, Okla.

C. Wiley Post Airport, Oklahoma City, Okla.

You find that a Visual Approach Slope Indicator (VASI), an FAA-operated control tower, UNICOM facilities, and ground control are all available at—

1—Airport A only.

2—Airport B only.

3—Airports A and B only.

4—Airports A, B, and C.

19. A correct performance of "S" turns across a road and turns about a point requires that the bank must be steepest when—

1—Flying directly downwind.

2—Flying directly crosswind on the downwind side.

3—Entering the turn on the upwind side.

4—Flying directly crosswind on the upwind side.

20. Because of various factors which can cause a tailwheel-type airplane to deviate from the desired direction on the takeoff roll, many beginner students experience considerable difficulty on takeoff in such airplanes. To help the student overcome this difficulty, it would be best for the instructor to—

1—Thoroughly explain "P" factor (asymmetrical thrust).

2—Make certain that the student understands the relationship between control effectiveness and speed.

3—Give repeated demonstrations of the correct technique.

4—Demonstrate how crosswinds influence directional control on the ground.

21. Which of the following statements pertaining to angle of attack is correct?

1—If a constant airspeed can be maintained, the angle of attack will increase as the pitch is increased.

2—It is possible for the wing of an airplane to pass through the air at a high angle of attack even though a constant altitude is maintained.

3—An airplane in a power-off descent will normally have a negative angle of attack.

4—Regardless of the angle of attack, stalls will occur only at low or comparatively low airspeeds.

22. When performing the maneuver "eights on pylons" at a constant throttle setting during a strong wind, the pivotal altitude will—

1—Remain constant.

2—Decrease slightly when flying into the wind in the turns.

3—Increase slightly when flying into the wind in the turns.

4—Decrease slightly when flying downwind in the turns.

23. Although spins are not required on flight tests for private or commercial pilot certificates, airplane flight instructors should be familiar with the principles of spins and with spin performance and recovery procedures. A spin can be entered—

1—Only if the airplane first enters a stall.

2—Without first stalling the airplane if the pilot wishes to force it into the spin.

3—Only from a stall encountered at a high pitch attitude.

4—Without first stalling the airplane only when the entry is made from a tight diving spiral.

24. After scanning the instrument group which appears in Figure 25 in the Appendix, a pilot normally should interpret these indications to mean that the airplane is—

1—Descending, but because the primary instrument and supporting instruments for the turn do not agree, it is impossible to determine the direction without cross-checking the directional gyro or the compass.

2—Descending in a standard rate turn to the right.

3—Descending at 1,200 feet per minute with a bank of approximately 23° to the left.

4—Descending in a slipping turn to the left.

2671

25. In order to impress students with the importance of the performance charts in the *Airplane Flight Manual,* a flight instructor requires his students to compute the take-off distance at two separate airports. The conditions at these two airports are assumed to be as follows:

	Airport "A"	*Airport "B"*
Elevation of Airport	30 feet	6,250 feet.
Temperature	84° F	36.5° F.
Windspeed (headwind component).	15 m.p.h	Calm.
Runway	Hard surface	Hard surface.
Gross weight	1,900 pounds	2,200 pounds

Assuming normal engine operation and normal pilot technique, the distance that the airplane travels from the beginning of the takeoff roll until it reaches an altitude of 50 feet (above the runway) is approximately (refer to Figure 4 in the Appendix)—

1—370 feet for takeoff at Airport "A" and 1,300 feet for takeoff at Airport "B."
2—One and one-half times as long for takeoff at Airport "B" as for takeoff at Airport "A."
3—Twice as long for takeoff at Airport "B" as for takeoff at Airport "A."
4—Three times as long for takeoff at Airport "B" as for takeoff at Airport "A."

On the student's first cross-country flight, you wish to demonstrate the peculiarities of the magnetic compass while maneuvering on different headings. In order to stress the importance of maintaining straight-and-level, unaccelerated flight while reading the magnetic compass, you accomplish the demonstrations that follow: On the outbound leg which is on a northerly heading, you make shallow banked turns to the left and right and have the student observe the reaction of the magnetic compass; you repeat the same demonstration on the return flight which is on a southerly heading.

26. As the *entry into a left turn* is made on each of the above demonstrations, the student would most likely observe an indication on the magnetic compass as illustrated in (refer to Figure 9 in the Appendix).

1—MC–1 when on a north heading; MC–3 when on a south heading.
2—MC–1 when on a north heading; MC–4 when on a south heading.
3—MC–2 when on a north heading; MC–4 when on a south heading.
4—MC–2 when on a north heading; MC–3 when on a south heading.

27. Referring to Figure 7 in the Appendix, assume that the sets of instruments labelled A, B, and C are located in three different airplanes. Each airplane is flying at the same altitude and in the same atmospheric conditions. Match each set of instruments (airspeed and attitude indicator) with the turn-and-slip indicator which most nearly represents its rate of turn. The correct combination is—

1—(A, N–2), (B, N–2), (C, N–2).
2—(A, N–3), (B, N–1), C, N–1).
3—(A, N–3), (B, N–2), (C, N–1).
4—(A, N–1), (B, N–2), (C, N–3).

28. Assume that the Airplane Flight Manual lists the following airspeeds for a light twin-engine airplane:

	Both engines operating (mph)	*One engine out (mph)*
Best rate-of-climb speed	150	100
Best angle-of-climb speed	80	95
V_{mc} (minimum control speed)	—	87

If one engine of this light twin becomes inoperative during flight, the pilot will lose altitude at the slowest rate, or gain altitude as quickly as possible if he establishes an airspeed of—

1—87 mph.
2—95 mph.
3—100 mph.
4—150 mph.

29. On a cross-country flight, you are demonstrating the use of the VOR as an aid to navigation to your student who is working toward a commercial pilot certificate. You are approaching the VOR station from the east, and are north of the 090° radial; the course (omnibearing) selector is set to 270°; and your omnireceiver indications are as depicted in illustration "OR–3" (Figure 8 in the Appendix). You make a 180° turn to the right to an easterly heading. The

2674

ANALYSIS OF ANSWERS TO SAMPLE TEST ITEMS

Item	Answer	
1	4	The *Flight Instructor's Handbook*, AC 61–16, states, "The procedure and elements mastered in each step should be identified in demonstrating the performance of the subsequent step . . . each lesson should also require the student to recall and apply previous learning . . . a maneuver which incorporates the elements used in the preceding maneuver and extends their application or associates them with other flight elements, provides much more effective training than does a maneuver which is completely foreign to the preceding maneuvers."
2	4	The *Flight Instructor's Handbook*, AC 61–16, states, "Teaching success depends more upon lesson planning than it does on presentation, personality, flying ability, or experience."
3	3	The *Flight Instructor's Handbook*, AC 61–16, states, "Negative motivations . . . are not characteristically as effective in promoting efficient learning as are positive motivations."
4	2	The *Flight Instructor's Handbook*, AC 61–16, states, "Worries and emotional upsets which result from the course at hand can be remedied. Such occurrences are usually evidence of inadequacies on the part of the course or of the instructor concerned."
5	1	The *Flight Instructor's Handbook*, AC 61–16, states, "The flight instructor's first step in teaching is to gain the student's confidence."
6	3	The *Flight Instructor's Handbook*, AC 61–16, states, "A student whose slow progress is found to be due to lack of confidence should be assigned subgoals which can be achieved easily."
7	2	The *Flight Instructor's Handbook*, AC 61–16, states, "For such a student the good instructor will continually raise the standard of performance for each lesson, demanding a greater effort from the student."
8	3	The *Flight Instructor's Handbook*, AC 61–16, states, ". . . it was soon recognized that students trained in this manner are more precise in their flight maneuvers and operations . . . the performance he obtains from an airplane increases noticeably . . . integrated flight instruction provides the student with the ability to control an airplane in flight for limited periods under favorable circumstances . . . this ability could save the pilot's life and those of his passengers . . ."
9	4	The *Flight Instructor's Handbook*, AC 61–16, states, "Communication at the understanding level goes far beyond the receipt of information; ideas must be comprehended. Understanding is a higher type of communication than is the mere acquisition of facts. To be effective, however, the flight instructor must go beyond this level of communication. Effective communication requires that information be provided

2675

Item	Answer	
		in such a way that it affects the behavior of the student."
10	1	The *Flight Instructor's Handbook*, AC 61–16, states, "Negative self-concepts inhibit the perceptual processes by introducing psychological barriers which tend to keep the student from receiving them and then perceiving what the instructor intends. They may even inhibit the ability to properly implement that which is perceived. That is, they affect unfavorably the 'ability to do.' Learners who view themselves positively, on the other hand, are less defensive. . . ."
11	3	The *Flight Instructor's Handbook*, AC 61–16, points out that ". . . they are valuable only as aids to good instruction; and none has yet been devised which successfully eliminated the need for an instructor."
12	3	The *Flight Instructor's Handbook*, AC 61–16, states. "Too much criticism of his flight performance may completely subdue a timid person."
13	2	The *Flight Instructor's Handbook*, AC 61–16, states, "Any practical flight training syllabus must be flexible, and should be used primarily as a guide. The order of training can and should be altered, when necessary, to suit the progress of the student and the exigencies of special circumstances."
14	4	The *Flight Instructor's Handbook*, AC 61–16, states, "Only by a keen analysis of his students, and a continuing deep interest in them, can he live up to his responsibilities and be an effective flight instructor."
15	3	The *Flight Instructor's Handbook*, AC 61–16, states, "There are four basic steps in the teaching process, without which effective instruction is impossible. They are (1) preparation, (2) explanation and demonstration, (3) trial and practice, (4) review and evaluation."
16	4	The altitude indicated on the altimeter in Figure 3 in the Appendix is 2,500 feet MSL. This is also assumed to be the elevation of the terrain along the route. Altitude "A" of 4,500 feet and Altitude "B" of 5,000 feet MSL are both less than 3,000 feet, but more than 500 feet above the surface, and therefore VFR flight at either of these two altitudes on a magnetic course of 135° would normally comply with Regulations. With an altitude of 7,500 feet, however, the flight would be *at* an altitude of 3,000 feet above the surface; therefore, subject to the provisions of FAR 91.109 which state in part ". . . each person operating an aircraft under VFR in level cruising flight *at or above* 3,000 feet above the surface, shall maintain the appropriate altitude prescribed below: "(a) When operating below 18,000 feet MSL, and— "(1) on a magnetic course of zero degrees through 179 degrees, any odd thousand foot MSL altitude +500 feet (such as 3,500, 5,500, or 7,500); or "(2) on a magnetic course of 180 degrees through 359 degrees, any even thousand foot MSL altitude +500 feet (such as 4,500, 6,500, or 8,500)." It is apparent, therefore, that Altitude "C" also complies with FAR 91.109(a)(1). Hence, the fourth alternate response would be the correct answer.
17	1	The National Transportation Safety Board, Safety Investigation Regulations, Part 430 (formerly CAB, Part 320), requires that the NTSB be notified immediately of any accident involving "substantial damage" to the aircraft (damage or structural failure which adversely affects the structural strength,

2676

Item Answer

performance, or flight characteristics of the aircraft, and which would normally require major repair or replacement of the affected component). Additionally, a written report must be submitted to the NTSB within 10 days after the occurrence.

18 3 A check of the Airport/Facility Directory of the *Airman's Information Manual* (see excerpts in the Appendix) reveals that Will Rogers World and Tulsa Airports list as available each of the services listed in the test item.

19 1 In any ground track maneuver in which a constant radius of turn is to be maintained, the angle of bank should be directly proportional to the groundspeed. The faster the groundspeed, the steeper the bank; the slower the groundspeed, the shallower the bank. The *Flight Training Handbook* states, "The steepest bank will be the point at which the groundspeed is highest." In "S" turns across the road, this point will be when entering the turn on the downwind side. This assumes that the wind direction is perpendicular to the road and the airplane is going directly downwind with a groundspeed greater than at any other point in the maneuver. This same rule would apply to constant radius turns about a point.

The *Flight Training Handbook* further states, "Throughout the maneuver (turns about a point), the bank required at any given position is proportional to the groundspeed; the faster the groundspeed, the steeper the bank; the slower the groundspeed, the shallower the bank . . . it follows then that the steepest bank is required when the airplane is headed directly downwind. . . ."

20 2 "P" factor and crosswinds certainly play a part in the problems

Item Answer

of directional control on takeoffs, but an understanding of these factors will not in itself correct the difficulties involved if the student does not have a clear concept of the *use of controls* and *how their effectiveness* changes with speed. The same thing is true in regard to repeated demonstrations. Therefore, alternate response 2 is the correct answer. (See *Flight Training Handbook.*)

21 2 The *Flight Instructor's Handbook,* AC 61–16, states, "It is possible for the wing to pass through the air at a high angle of attack when the airplane descends in a level flight attitude. Conversely, the angle of attack may be near zero in a steep dive." If, through analysis of the information contained in figure 31 in the Appendix, we can accept the validity of this statement, then we can perceive that when using low power settings and slow speed, it will also be necessary to use a high angle of attack in order to maintain a constant altitude. (See *Flight Training Handbook* and Exam-O-Gram No. 28.)

22 2 The *Flight Training Handbook* states, "Since the headings throughout the turn vary from downwind to directly into the wind, the groundspeed will never be constant when there is a wind. This may result in variations in the pivotal altitude throughout the eight." A careful study of the material presented in the *Flight Training Handbook* will clarify the fact that, in the performance of pylon 8's in a stiff breeze, ". . . the average pivotal altitude will be slightly lower . . ." than when flying at the same airspeed in calm or light winds.

23 1 The *Flight Training Handbook* defines a spin as an aggravated stall that results in autorotation. It also states that "Care must be

2677

Item	Answer	
		taken to completely stall the airplane; otherwise it may not spin and the only result will be a skidding spiral of increasing speed. If such a maneuver results, it is useless to continue in the hope of eventually spinning the airplane . . . Any tendency to relax on the controls after the spin is in progress will result in a sloppy spin and in many cases will completely stop the spin."
24	2	The airplane is descending in a turn to the right. The descent is confirmed by: a. The nose down indication on the gyro-horizon. b. The decreasing altitude as indicated on the altimeter. c. The down trend indicated by the vertical speed indicator. d. The increasing airspeed as shown by the airspeed indicator. The right turn is confirmed by: a. The turn needle of the turn-and-slip indicator. b. The bank to the right as indicated by the attitude of the wings in relation to the horizon on the gyro-horizon. On most gyro-horizons in use with light airplanes today, the degree of bank index at the top of the instrument moves OPPOSITE to the direction of bank and turn. (See *Flight Training Handbook* and *Private Pilot's Handbook of Aeronautical Knowledge.*)
25	4	In determining the takeoff distance at Airport "A," locate the "1,900 pound–15 mph" row on the Takeoff Data Chart, Figure 4 in the Appendix. Follow this row to the "At sea level and 59° F—Clear 50′ obstacle" column where you read 675 feet. Since the temperature at Airport "A" is 25° above standard, this distance will have to be increased by 10 percent (see Note at bottom of chart). Ten percent of 675 is 68 feet. 675 plus 68 feet gives a total takeoff distance at Airport "A" of 743 feet. In computing the takeoff distance at Airport "B," locate the "2,200 pound zero mph wind" row. 6,250 feet, 36½° F falls halfway between the "5,000-foot and 41° column" and the "7,500-foot and 32° F" column. Therefore, you will have to interpolate between the values found in these two columns. Follow the selected row out to these 2 columns ("to clear 50′ obstacle" portion) where you read 1,995 feet and 2,495 feet. The distance halfway between these two distances is 2,245 feet. The takeoff distance at Airport "B" is 2,245 feet which is approximately 3 times the takeoff distance of 743 feet at Airport "A." (See *Private Pilot's Handbook of Aeronautical Knowledge.*)
26	4	If a turn is made from a north heading, the magnetic compass will normally indicate a turn in the opposite direction, and then will lag behind the turn. If a turn is made from a south heading, the magnetic compass will indicate a turn in the same direction, but a much greater amount of turn than has actually been made. Therefore, as you enter a left turn from a north heading, the magnetic compass will indicate a turn toward the east. As you enter a left turn from a south heading, the magnetic compass will indicate a turn toward the east, but a much greater amount of turn than you have actually made. (See Exam-O-Gram No. 12.)
27	3	The rate of turn of an airplane is directly proportional to the angle of bank and inversely proportional to the true airspeed. Therefore, as the angle of bank increases, the rate of turn increases, and as the airspeed increases, the rate of turn

2677

2678

Item	Answer	
		decreases. The angle of bank is the same for all three airplanes. Therefore, the rate of turn will depend upon the airspeed. Since Airplane "A" has the lowest airspeed, its rate of turn will be the greatest; Airplane "C" is flying at the highest airspeed, so its rate of turn will be the least; and the rate of turn for Airplane "B" will fall somewhere between that of "A" and "C." (See "Standard Rate, Level Turns" in *Flight Training Handbook.*)
28	3	If one engine of a light twin-engine airplane becomes inoperative, the pilot will be able to gain altitude at the best rate or lose altitude at the slowest rate if he maintains the best single-engine rate-of-climb speed. The *Flight Training Handbook* states that "The engine-out best rate-of-climb speed is found in the Airplane Flight Manual . . . it is the airspeed which results in the greatest increase in altitude in a unit of time."
29	3	The indications on the TO-FROM Indicator and the LEFT-RIGHT needle are dependent *only* upon the setting of the omnibearing selector and your position relative to the VOR station. The indications are not dependent on the heading of the aircraft with respect to the VOR station. Therefore, regardless of the heading to which Aircraft "A" turns, the TO-FROM indicator and the LEFT-RIGHT Needle will not change their indications as long as the omnibearing selector setting remains constant and the aircraft remains north of the 090° radial and east of the 360° radial. The *Flight Training Handbook* states, "The vertical or deviation needle shows the position of the aircraft without any reference to its heading . . . the VOR bearing selector and the TO-FROM indicator always show correctly the position of the airplane in relation to the station, regardless of the heading of the airplane." Also refer to the *Private Pilot's Handbook of Aeronautical Knowledge.*
30	1	The following rules apply: a. The force of lift always acts in a direction perpendicular to the relative wind and to the lateral axis of the aircraft (wingtip to wingtip axis). b. The direction of weight is always toward the center of the earth and does not change even though the aircraft changes attitudes and flight paths. c. For all practical purposes, thrust acts parallel to the longitudinal axis of the aircraft. d. Drag acts in the opposite direction to the flight of the aircraft, and it is parallel to the relative wind. References to the forces which act on an airplane in flight may be found in the *Flight Training Handbook* and in the *Private Pilot's Handbook of Aeronautical Knowledge.*

2679

APPENDIX

All of the charts, illustrations, and selected EXAM-O-GRAMS presented in this Appendix are of value to the student preparing for the test for the Flight Instructor Certificate. Users of this Guide should not assume that the questions appearing in the sample test make full use of the material in the Appendix. This would seriously limit the benefits to be derived from the Appendix material. Every chart or illustration can be related to topics covered in the Study Outline. Even more important is the fact that many charts or illustrations in the Appendix are either directly or indirectly related to the charts, illustrations, and questions that appear in the actual test. Study all of them.

Several VFR Exam-O-Grams have been reprinted here for the convenience of those interested in the rating of airplane flight instructor. These particular study aids have been selected because the information they contain is especially pertinent to this test.

It should be noted that EXAM-O-GRAMS are nondirective in nature, and are issued solely as an information service to individuals interested in Airman Written Tests.

A list of all the VFR Exam-O-Grams available from the Federal Aviation Administration is also included.

To maintain constant power, correct manifold pressure approximately 0.17" Hg for each 10° F. variation in carburetor air temperature from standard altitude temperature. Add manifold pressure for air temperatures above standard; subtract for temperatures below standard.

AIRPORT/FACILITY DIRECTORY LEGEND

LOCATION

The airport location is given in nautical miles (to the nearest mile) and direction from center of referenced city.

ELEVATION

Elevation is given in feet above mean sea level and is based on highest usable portion of the landing area. When elevation is sea level, elevation will be indicated as "00." When elevation is below sea level, a minus sign (−) will precede the figure.

RUNWAYS

The runway surface length, and weight bearing capacity are listed for the longest instrument runway or sealane, or the longest active landing portion of the runway or strip, given to the nearest hundred feet, using 70 feet as the division point, i.e., 1468 feet would be shown as "14"; 1474 feet would be shown as "15". Runway lengths prefixed by the letter "H" indicates that runways are hard surfaced (concrete; asphalt; bitumen, or macadam with a seal coat). If the runway length is not prefixed, the surface is sod, clay, etc. The total number of runways available is shown in parenthesis. (However, only hard surfaced runways are counted at airfields with both hard surfaced and sod runways.)

RUNWAY WEIGHT BEARING CAPACITY

Add 000 to figure following S, T, TT and MAX for gross weight capacity, e.g., (S-000).

S-Runway weight bearing capacity for aircraft with single-wheel type landing gear. (DC-3), etc.

T-Runway weight bearing capacity for aircraft with twin-wheel type landing gear. (DC-6), etc.

TT-Runway weight bearing capacity for aircraft with twin-tandem type landing gear. (707), etc.

Quadricycle and twin-tandem are considered virtually equal for runway weight bearing considerations, as are single-tandem and twin-wheel.

A blank space following the letter designation is used to indicate the runway weight bearing capacity to sustain aircraft with the same type landing gear, although definite figures are not available, e.g., (T-).

Omission of weight bearing capacity indicates information unknown. Footnote remarks are used to indicate a runway with a weight bearing greater than the longest runway.

LIGHTING

B: Rotating Light (Rotating beacon). (Green and white, split-beam and other types.) Omission of **B** indicates rotating light is either not available or not operating standard hours (sunset-sunrise).

NOTE.—Code lights are not codified, and are carried in Remarks.

L: Field Lighting. An asterisk (*) preceding an element indicates that it operates on prior request only (by phone call, telegram or letter). Where the asterisk is not shown, the lights are in operation or available sunset to sunrise or by request (radio call). **L** by itself indicates temporary lighting, such as flares, smudge pots, lanterns.

1—Strip lights or portable runway lights (electrical)

2—Boundary

3—Runway Floods

4—Low Intensity Runway

5—Medium Intensity Runway

6—High Intensity Runway

7—Instrument Approach (neon)

8A, B, or C—High Intensity Instrument Approach

9—Sequence Flashing Lights (3,000′ out unless otherwise stated)

10—Visual Approach Slope Indicator (VASI)

11—Runway end identification lights (threshold strobe) (REIL)

12—Short approach light systems (SALS)

13—Runway alignment lights (RAIL)

14—Runway centerline

15—Touchdown zone

Because the obstructions on virtually all lighted fields are lighted, obstruction lights have not been included in the codification.

DAYLIGHT SAVING TIME

Daylight Saving Time runs from the last Sunday in April to the last Sunday in October. All states in conterminous United States except Kentucky are on Daylight Saving Time.

OTHER

AOE—Airport of Entry.
VASI—Visual Approach Slope Indicator, applicable runway provided.
RVV—Runway Visibility Values, applicable runway provided.
RVR—Runway Visual Range, applicable runway provided.

FLIGHT SERVICE STATION

FSS—The name of the associated FSS is shown in all instances. When the FSS is located on the named airport, "on fld" is shown following the FSS name. When the FSS can be called through the local telephone exchange, (Foreign Exchange) at the cost of a local call, it is indicated by "(LC)" (local call) with the phone number immediately following the name of the FSS, i.e., "FSS: WICHITA (LC481-5867)." When an Interphone line exists between the field and the FSS, it is indicated by "(DL)" (direct line) immediately following the name of the FSS, i.e., "FSS: OTTO (DL)."

AIRPORT REMARKS

"FEE" indicates landing charges for private or non-revenue producing aircraft. In addition, fees may be charged for planes that remain over a couple of hours and buy no services, or at major airline terminals for all aircraft.

"Rgt tfc 13–31" indicates right turns should be made on landings and takeoffs on runways 13 and 31.

Remarks data is confined to operational items affecting the status and usability of the airport, traffic patterns and departure procedures.

Obstructions.—Because of space limitations only the more dangerous obstructions are indicated. Natural obstructions, such as trees, clearly discernible for contact operations, are frequently omitted. On the other hand, all pole lines within at least 15:1 glide angle are indicated.

COMMUNICATIONS

Clearance is required prior to taxiing on a runway, taking off, or landing at a tower controlled airport.

When operating at an airport where the control tower is operated by the U.S. Government, two-way radio communication is required unless otherwise authorized by the tower. (When the tower is operated by someone other than the U.S. Government, two-way radio communication is required if the aircraft has the necessary equipment.)

Frequencies transmit and receive unless specified as: T—Transmit only, R—Receive only, X—On request. Primary frequencies are listed first in each frequency grouping, i.e., VHF, LF. Emergency frequency 121.5 is available at all TOWER, APPROACH CONTROL and RADAR facilities, unless indicated otherwise by a cross-out: ~~121.5~~

Radar available is listed under "RADAR SERVICES" Radar beacons are indicated by "(BCN)" after "RADAR SERVICES", when available.

COMMUNICATIONS REMARKS

Remarks data are confined to operational items affecting the status and usability of navigational aids, such as: ILS component restrictions, part time tower hours of operation, frequency sectorization, VOT frequencies, proposed changes to navigational aids, etc.

VOICE CALL

The voice call for contact with the traffic control services listed at each airport is the airport name followed by the call of the particular service desired, i.e., "LAGUARDIA TOWER." In these instances, only the name of the service is listed. When the voice call of the facility is not the same as the airport name, the complete voice call is listed.

SERVICES AVAILABLE

TOWER

Pre-Taxi Clearance Procedure
Clearance Delivery (CLRNC DEL).
Approach Control (APP CON) Radar and Non-Radar.

FIGURE 33. Airman's Information Manual—*Airport/Facility Directory Legend Excerpt.*—Continued.

2698

Departure Control (DEP CON) Radar and Non-Radar.
VFR Advisory Service (VFR ADV) Non-Radar.
Traffic Information Service (TFC INFO) Radar.
Surveillance Radar Approach (ASR).
Precision Radar Approach (PAR).
Ground Control (GND CON).
VHF Direction Finding (VHF/DF).

RADIO NAVIGATION AIDS

Included in this section is a tabulation of all Air Navigation Radio Aids in the National Airspace System and those upon which the FAA has approved an instrument approach. Private or military Navigation Radio Aids not in the National Airspace System are not tabulated.

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS)

ATIS is continuous broadcast of recorded non-control information in selected areas of high activity. See Part 1.

RADAR APPROACH PROCEDURE MINIMA

Weather minima for precision and surveillance radar approaches (PAR/ASR) specify only the lowest straight-in authorized for the approach.

FLIGHT SERVICE STATION (FSS)

Airport Advisory Service (AAS).
Island, Mountain and Lake Reporting Service.

UNICOM

A private aeronautical advisory communications facility operated for purposes other than air traffic control, transmits and receives on one of the following frequencies:

U-1—122.8 for Landing Areas (except heliports) without an ATC Tower or FSS;
U-2—123.0 for Landing Areas (except heliports with an ATC Tower or FSS;
U-3—123.05 for heliports.

VFR EXAM-O-GRAM NO. 3

AN INVISIBLE HAZARD TO LIGHT AIRCRAFT

The Civil Aeronautics Board listed the probable cause of a recent fatal light aircraft accident as structural failure of a light aircraft resulting from excessive airloads created by wingtip vortices behind a large aircraft. The report also states: "The dangers of wake or vortex turbulence are still unknown to many pilots."

Discussion of Wingtip Vortices

1. WHAT ARE WINGTIP VORTICES? It is unfortunate that vortices are invisible. If you could see them, they would look like a pair of horizontal tornadoes stretching back from each wingtip. These violent, compact, and fast-spinning air masses extend behind an aircraft for miles. Many pilots refer to this phenomenon as "propwash" or "jetwash," but engineering studies have revealed this term a misnomer. The main source of this disturbance is not from the powerplant; it is from the wingtip.

2. WHY ARE THEY DANGEROUS? They are dangerous because all tests to date indicate that *structural failure in the air* can occur in light aircraft upon penetration of the vortices behind larger transport aircraft. During takeoff or landing, care should be taken to *avoid vortex disturbance.* Loss of control could be the result at a critical time when control is of prime importance to safety.

3. UNDER WHAT CONDITIONS ARE THEY MOST DANGEROUS? There are many factors affecting the intensity of a wingtip vortex, but it is a safe and practical generalization that *the bigger the airplane the more violent and long-lived* will be the vortex disturbance. The source of this insidious danger can be out of sight by the time you encounter the wake. For example: A large aircraft could take off and be out of sight, or land and be on the ramp and the turbulence could still be present near the runway. No practical rule involving a time interval for one aircraft to fly behind another will assure avoidance of the turbulence generated by the first. The heavier and slower the aircraft, the greater the intensity of the air circulation in the vortex core. A modern large transport aircraft will create vortices of maximum turbulence *during takeoffs and landings at near maximum gross weights.*

4. WHAT ACTION CAN THE PILOT TAKE TO AVOID OR REDUCE THIS HAZARD?

a. Avoid passing behind any large aircraft.
b. Avoid, when possible, places and altitudes frequented by large aircraft. Constantly monitor your radio for location of such aircraft.
c. When it is necessary to operate behind a large, heavy aircraft, remain *above* the flight path of that aircraft. Vortices settle downward toward the surface. They are also affected by the wind and move with the encompassing air mass.
d. When taking off or landing behind large aircraft, be on the alert for the first sign of turbulence and allow adequate spacing.
e. The best way of avoiding the turbulence hazard is to know where they are most likely to be encountered and act accordingly. Since vortices are not formed until lift is produced, they will not be generated by an aircraft taking off until just before lift off—at the point where rotation is made. Vortices cease to be generated by a landing aircraft when its wings cease to produce lift—when it has actually landed.

5. RECOMMENDED READING FOR ALL PILOTS. Your attention is invited to the Safety of Flight Section of the *Airman's Information Manual* which thoroughly and completely explains "Wake Turbulence." This article has been reprinted in FAA Advisory Circular AC 90–23A (which may be obtained free of charge from: Distribution Unit, HQ–438, Federal Aviation Administration, Washington, D.C. 20590). We recommend that *all pilots read, study,* and *think* through the contents of this "Wake Turbulence" article.

2702 • 2702

VFR EXAM-O-GRAM NO. 10

FUEL CONTAMINATION

EXCERPTS FROM A RECENT AIRCRAFT ACCIDENT REPORT: ". . . Subsequent examination of the engine and its components revealed large deposits of foreign material, sediment, and water in the fuel strainer, carburetor bowl, and fuel pump in sufficient quantities to cause stoppage. . . . Probable cause of accident: Inadequate preflight action by the pilot; subsequent *engine failure due to fuel contamination. . . .*"

DO YOU KNOW—AND PRACTICE—THE PRECAUTIONS YOU SHOULD TAKE TO AVOID FUEL CONTAMINATION? Perhaps you do, but there are many pilots who obviously do not—*as evidenced by the alarming increase in the number of accidents caused by fuel contamination.* The modern aircraft engine is a remarkably reliable and dependable mechanism, but it will not run on water, dirt particles, and other noncombustibles. Let's review this insidious problem by asking—and answering—a couple of rather pointed questions about this subject.

1. *WHAT CAUSES FUEL CONTAMINATION?*

   A. *Storing the aircraft with partially filled fuel tanks may cause condensation and water contamination.* You have, no doubt, often noticed moisture (or dew) on the outside of your aircraft early in the morning. When you noticed this, did it occur to you that this same moisture could form on the inside walls of your fuel tanks? Water is the worst offender in these contamination cases, and condensation inside the tank is one of the methods by which it finds its way into your fuel system.

   B. *Servicing the aircraft from improperly filtered tanks, particularly small tanks or drums, is another principal source of fuel contamination.* This practice frequently introduces both dirt and water into the aircraft fuel system.

2. *WHAT PRECAUTIONS SHOULD THE PILOT TAKE TO AVOID FUEL CONTAMINATION?*

   A. PRELIGHT ACTION: Drain a generous sample of fuel (several ounces—not just a trickle or two) into a transparent container from each of the fuel sumps. (Notice that we specified each of the fuel sumps. This includes not only the main gascolator, but also the wing tank sumps.) Examine the sample of fuel from each sump for water and dirt contamination. Water *will not mix* with gasoline. If present, it will collect at the bottom of the transparent container and will be easily detected. If water or dirt appears, continue to drain fuel from that sump until you are sure the system is clear of all water and dirt. (NOTE: If your aircraft is not equipped with wing tank quick-drain petcocks, it is recommended they be installed. This can make the preflight check of the wing tank sumps much more convenient, as the frequent removal and replacement of wing tank sump drain plugs can be a time-consuming operation.)

2703

B. POSTFLIGHT ACTION: (1) *Top off your tanks at the end of the day to avoid condensation and water contamination inside your fuel tanks.* Although this is a desirable procedure to follow at the end of each flying day (assuming your loading schedule for the next day will permit a full load of fuel), it is particularly important that this is done if the aircraft is to stand idle for several days—whether it is tied down out-of-doors or stored in a hangar. (2) Avoid, if possible, servicing your aircraft from small tanks or drums. *Should this become necessary, the fuel should always be strained through a chamois skin that is in good condition.*

C. PRECAUTIONARY MAINTENANCE ACTION: In addition to the previously discussed precautions, the following maintenance precautions should be performed on your aircraft at periodic intervals:
(1) Inspect and clean the tank fuel outlet finger strainer.
(2) Inspect and clean the inlet carburetor screen.
(3) Flush the carburetor bowl.

BY FOLLOWING ALL OF THESE PRECAUTIONS, YOU CAN GREATLY REDUCE THE HAZARD OF ENGINE FAILURE DUE TO FUEL CONTAMINATION.

To better understand the reasons for the PREFLIGHT ACTION we have recommended, let's take a brief look at an actual water contamination test recently conducted by FAA—it's a real eye opener!

After all water was removed from the fuel system of a popular make high-wing monoplane, three gallons of water were added to the half-full fuel tank. After a few minutes, the fuel strainer (gascolator) was checked for water. *It was necessary to drain 10 liquid ounces of fuel before any water appeared.* This is considerably more than most pilots drain when checking for water.

In a second test with the same aircraft in flying attitude (to simulate a later tricycle geared model), the fuel system was again cleared of all water; then one gallon of water was added to the half-full tank. Upon checking the fuel strainer (gascolator) quick drain, *more than a quart of fuel was drained before any water appeared.*

In both of the above-described tests, about nine ounces of water remained in the fuel tank after the belly drain and the fuel strainer (gascolator) had ceased to show any trace of water. *This residual water could be removed only by draining the tank sumps.*

Two significant findings emerged from the above tests and from tests made on a plastic mockup of a similar fuel system:

1—When water was introduced into the fuel tank, it immediately settled to the bottom, but did not flow down the fuel lines to the fuel strainer until all fuel was drained from the lines. Remember the fuel tank must be turned ON to drain the tank lines through the gascolator.

2—Since it was found impossible to drain all water from the tank through the fuel lines, it was necessary to drain the fuel tank sumps in order to remove all water from the system.

2704

VFR EXAM-O-GRAM NO. 11

DENSITY ALTITUDE AND ITS EFFECT ON AIRCRAFT PERFORMANCE

A report of a recent accident was stated in the following words: "Takeoff was attempted on a 1,600-foot strip; the airplane cleared the fences but sank back and struck a ditch." The pilot states that he failed to consider the effect of the grassy, rough field, the *90° temperature*, heavy load of fuel and passengers, and the calm wind.

This EXAM-O-GRAM discusses the effect that high temperature and other factors had on this takeoff.

1. *WHAT IS DENSITY ALTITUDE?* It is a measure of air density. Under non-standard conditions, density altitude will differ from the elevation. As the air density decreases (i.e., air becomes thinner), density altitude increases, and vice versa. *Low atmospheric pressure, high temperature,* and *high humidity* all result in a decrease in air density and an *increase in density altitude.* (Contrary to prevailing opinion, *moist air is less dense than dry air.* Water vapor actually weighs less than dry air—approximately 5/8 as much).

2. *WHAT EFFECT DOES AN INCREASE IN DENSITY ALTITUDE HAVE ON AIRCRAFT TAKEOFF PERFORMANCE?*

   A. Engine horsepower decreases (unless it is a supercharged engine).

   B. The propeller loses some of its efficiency as it will not take as much of a bite out of the thinner air.

   C. Takeoff distance is increased and rate of climb is decreased because of the loss of engine power and propeller efficiency, and the higher true airspeed necessary to obtain the required lift in the thinner air. (In other words, if the density altitude is 8,000 feet at an elevation of 5,000 feet, the aircraft flies as though it were at 8,000 feet.)

3. *UNDER WHAT CONDITIONS IS A HIGH "DENSITY ALTITUDE" MOST HAZARDOUS?* When it is present with other factors that tend to increase the takeoff distance or require that this distance be limited such as: heavy load; calm wind conditions; short runway; obstructions at or near the end of the runway; and unfavorable runway conditions (rough, tall grass, soft, snow, upgrade, etc.).

4. *HOW MUCH CAN THE DENSITY ALTITUDE VARY AT A GIVEN AIRPORT DURING SEASONAL*

2705

NOTES:

+ = **Much greater than normal;** check manufacturer's specifications.

− = Less than normal; check manufacturer's specifications.

* = General data not pertinent; check manufacturer's specifications.

† This computer has been developed by the Federal Aviation Agency. It is intended to supplement and **NOT** replace manufacturer's published performance information.

2706

EXTREMES? This depends mostly on the extremes in temperature variation. From a density altitude chart, it can be determined that, at an elevation of 5,000 feet, temperature –6°F, the density altitude would be approximately 2,200 feet; at a temperature of 104°F, the density altitude would be approximately 8,900 feet. These figures do not include the increase due to a high relative humidity on the 104° day. *Do not let the performance of your airplane on a cold winter day lull you into a sense of security when taking off on a hot, humid summer day.* (Note the pilot's remarks in the cartoon.)

5. *IF AN AIRPLANE REQUIRES A DISTANCE OF 1,200 FEET FOR TAKEOFF AT SEA LEVEL UNDER STANDARD CONDITIONS, WHAT DISTANCE IS REQUIRED AT A PRESSURE ALTITUDE OF 4,000 FEET, TEMPERATURE 100°F?* Referring to the DENALT Performance Computer, you find, for these conditions, a takeoff factor of 2.2. Therefore, the takeoff distance would be 1200′ x 2.2 which equals 2,640′. (Note: This computer shows figures for each 10° of temperature from −40°F to 120°F.)

Under the conditions presented in Item 5, it can be seen that the takeoff distance on a hot summer day at 4,000 feet pressure altitude, was 1,440 feet more than at sea level under standard conditions.

The DENALT computer has been recently developed by the Federal Aviation Administration to replace the Koch Chart. Two versions are available. One is for fixed-pitch propeller aircraft, and the other is for variable pitch propellers. Both versions are for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The price is 50¢ each. When ordering, specify either fixed pitch or variable pitch.

BEWARE OF
HIGH, HOT, AND HUMID CONDITIONS

2707

VFR EXAM-O-GRAM NO. 12

The Magnetic Compass

THE MAGNETIC COMPASS

The magnetic compass, in terms of its errors, limitations, and in-flight characteristics, is one of those aeronautical subjects in which consistently large numbers of pilots fare poorly on FAA written tests. There is evidence that this veteran instrument—it was one of the first to be installed in an aircraft—is one of the least understood instruments in the cockpit of today's modern general aviation aircraft. Many pilots seem to operate on the premise that it is easier to ignore this instrument's errors than to learn them. However, it should be remembered that (1) this is the only directional-seeking instrument in the cockpit of most general aviation aircraft, and (2) it is mechanically a simple, self-contained unit (independent of external suction or electrical power for its operation) that is likely to remain reliable at all times—reliable, that is, if the pilot understands its inherent errors.

WHAT ARE SOME OF THE COMPASS ERRORS THAT THE PILOT SHOULD UNDERSTAND?

The pilot should understand:

I. VARIATION—This is the angular difference between *true north* and *magnetic north* which is plotted on charts in *degrees east or west.* The pilot should understand perfectly *which to add and which to subtract* when converting from true headings or courses to magnetic headings or courses and vice versa. (Many pilots find such memory aids as "east is least and west is best" helpful in remembering that *east is subtracted* and *west is added* when going from *true* to *magnetic.*)

II. DEVIATION—This is the deflection of the compass needle from a position of magnetic north as a result of local magnetic disturbances in the aircraft. To reduce this deviation, the compass has a compensating device consisting of small adjustable magnets. The compass should be checked and compensated periodically. The errors remaining after "swinging" the compass should be recorded on a compass correction card which should be installed in the cockpit within the view of the pilot. (NOTE: Avoid placing metallic objects such as metal computers, flashlights, etc., on top of the instrument panel near the magnetic compass as this practice may induce large amounts of deviation and seriously affect the instrument's accuracy.)

2708

In addition to these errors, the pilot should have a *working knowledge* of the following in-flight errors:

III. OSCILLATION ERROR—The erratic swinging of the compass card which may be the result of turbulence or rough pilot technique.

IV. MAGNETIC DIP—The tendency of the magnetic compass to point down as well as north in certain latitudes. This tendency is responsible for:

A. Northerly Turn Error—*This error is the most pronounced of the in-flight errors.* It is most apparent when turning to or from headings of north and south.

B. Acceleration Error—An error that can occur during airspeed changes. It is most apparent on headings of east and west.

As a quick refresher on this instrument's in-flight dip error, we invite you to accompany us on a simulated demonstration flight around the compass rose. Unless otherwise noted, we will limit our bank during turns to a gentle bank. Also, we will assume that we are in the northern hemisphere because the characteristics which we will observe would not be present at the magnetic equator, and would be reversed in the southern hemisphere.

DEMONSTRATION NO. 1 (Heading—North; Error—Northerly Turn Error). As we start a turn in either direction from this heading, we notice that momentarily the compass *gives an indication of a turn opposite the direction of the actual turn.* (While the compass card is in a banked attitude, the vertical component of the earth's magnetic field causes the north-seeking end of the compass to dip to the low side of the turn, giving the pilot an erroneous turn indication). If we continue the turn toward east or west, the compass card will begin to indicate a turn in the correct direction, *but will lag behind the actual turn*—at a diminishing rate—until we are within a few degrees of east or west. One additional demonstration which we will cover before leaving north is the Slow Turn Error. If, while holding a compass indication of north, we sneak into a very gradual and shallow banked turn—say 3° or 4° of bank—it is possible to change the actual heading of the aircraft by 20° or more *while still maintaining an indication of north by the compass.*

DEMONSTRATION NO. 2 (Heading—East; Error–Acceleration Error). The Northerly Turn Error that we previously experienced is not apparent on this heading (or on a west heading). However, let's see what happens when we accelerate and decelerate by changing the airspeed. With the wings level, we will *increase* the airspeed by increasing the power setting or by lowering the nose—or both. Result—although we are holding the nose of the aircraft straight ahead, our compass card erroneously indicates a turn toward *north.* On the other hand, if we *decrease* the airspeed by reducing the power setting or raising the nose of the aircraft—or both, the compass will give an erroneous indication of a turn toward *south.* (Because of the pendulous-type mounting, the end of the compass card which the pilot sees is tilted upward while accelerating, and downward while decelerating during changes of airspeed. This momentary deflection of the compass card from the horizontal, results in an error that is most apparent on headings of east and west).

DEMONSTRATION NO. 3 (Heading—South; Error—Northerly Turn Error). Again we are presented with the Northerly Turn Error problem that we encountered in Demonstration No. 1. Although the same set of forces that caused the erroneous indi-

2709

cation when we banked the aircraft while on a north heading will likewise be working against us on this heading, the compass indications will appear quite different. For example, as we roll into a turn in either direction, the compass gives us an indication of a turn in the *correct direction* but at a *much faster rate than is actually being turned.* As we continue our turn toward west or east, the compass indications will continue to precede the actual turn—but at a diminishing rate—until we are within a few degrees of west or east. (It might be noted that the Acceleration Error is not apparent on this heading or on a north heading.)

DEMONSTRATION NO. 4 (Heading—West; Error—Acceleration Error). On this heading we encounter the exact same errors that we have previously covered on a heading of east in Demonstration No. 2. If we *increase the airspeed,* we will get an erroneous indication of a *turn toward north.* If we *decrease the airspeed,* we will get an erroneous indication of a *turn toward south.* (A memory aid that might assist you in recalling this relationship between airspeed change and direction of the error is the word "ANDS"—*A*ccelerate-*N*orth, *D*ecelerate-*S*outh.)

WHAT ARE THE MAIN POINTS THAT SHOULD BE REMEMBERED CONCERNING THESE FOUR DEMONSTRATIONS?

The points we are trying to get across are these: (1) WHEN TAKING READINGS FROM THE MAGNETIC COMPASS WHILE ON A NORTHERLY OR SOUTHERLY HEADING (for establishing a course, setting the gyro-driven heading indicator, etc.), REMEMBER THAT IT IS ESSENTIAL TO HAVE THE WINGS PERFECTLY LEVEL FOR SEVERAL SECONDS PRIOR TO TAKING THE READING. (2) IF YOU ARE ON AN EASTERLY OR WESTERLY HEADING, IT IS IMPORTANT THAT THE AIRSPEED IS CONSTANT IN ORDER TO GET AN ACCURATE READING. (3) ON AN INTERMEDIATE HEADING, BOTH OF THE ABOVE CONDITIONS SHOULD BE MET. (NOTE: If your aircraft is equipped with a gyro-driven heading indicator, check it frequently with your magnetic compass.)

TURNS TO HEADINGS BY REFERENCE TO THE MAGNETIC COMPASS

For the pilot who would like a general set of rules for determining his lead point for making turns by reference to the magnetic compass, the following is submitted:

(NOTE: The angle of bank should not exceed 15° in order to minimize dip error.)

1. *When turning to a heading of north, you must allow in addition to your normal lead, a number of degrees approximately equal to the latitude at which you are flying. Example:* You are making a left turn to a heading of north in a locality where the latitude is 30° N. You have previously determined your normal lead to be approximately 5° for this particular angle of bank. In this case, you should start your roll-out when the compass reads approximately 35°
2. *When turning to a heading of south, you must turn past your normal lead point by a number of degrees approximately equal to the latitude at which you are flying. Example:* You are making a right turn to a heading of south in a locality where the latitude is 30° N. You have previously determined your normal lead to be approximately 5° for this particular angle of bank. In this case, you should turn past your normal lead point of 175° (180°—5°) by 30°, and start your roll-out when the compass reads approximately 205°.
3. *The error is negligible when turning to east or west, therefore, use the normal amount of lead when turning to an east or west heading.*
4. *For intermediate headings that lie between the cardinal headings, use*

2709

2710

an approximation based on the heading's proximity to north or south, the direction of the turn, and your knowledge of the compass's lead and lag characteristics in these areas. In other words, use an "educated guesstimate."

We won't guarantee you that the above method will roll you out on the exact heading every time—at best, it is an approximate method. But it will get you reasonably close to your desired heading, and this beats having no method at all.

KNOW YOUR MAGNETIC COMPASS

2711

VFR EXAM-O-GRAM NO. 13

WEIGHT AND BALANCE

Loading the family automobile for a trip requires little serious planning. You can C-R-A-M as much luggage into the trunk as you have space, squeeze as many persons into the seats as you have room, and top off the gas tank with no thought given to Gross Weight or Center of Gravity. A similar approach to loading your "flying machine" could result in a serious accident.

WHAT IS EXCESSIVE WEIGHT? Assume that your airplane is a 4-place airplane with a baggage allowance of 120 pounds, a usable fuel capacity of 39 gallons, and an oil supply of 8 quarts. On a hypothetical flight you take on full fuel and oil servicing, toss the suitcases in the baggage compartment, and you and your three passengers eagerly climb aboard. This seems like a reasonable load, but if you had placed each of them on the scales you might have found that you and the passengers average 180 lbs. each (720 lbs.), and the four suitcases, 30 lbs. each (120 lbs.). The usable fuel load weighs 234 lbs. and the oil 15 lbs. Assume, also, that the Weight and Balance Data for the airplane shows an *empty weight* of 1325 lbs. and a maximum allowable gross weight of 2200 lbs. NOW, add the weight of the useful load to the empty weight and compare the total to the allowable gross weight. . . . (1089 lbs. +1325 lbs.=2414 lbs. . . . *214 lbs. excess!*

WHAT RESTRICTIONS ARE THERE ON WEIGHT AND BALANCE? In many civilian airplanes it is not possible to fill all seats, baggage compartment, and tanks, and still remain within the approved weight and balance limits. If you do not wish to leave a passenger behind (a normal reaction), you must reduce your fuel load and plan on shorter legs en route or cut down on the baggage carried, or both. Frequently, restrictions are placed on rear seat occupancy with maximum baggage allowance aboard. By all means, follow the Airplane Weight and Balance Form restrictions. The loading conditions and the empty weight of your particular airplane may differ from those shown in the Owner's Manual, especially if modifications have been made or equipment has been added to the basic airplane.

IS CRUISE PERFORMANCE AFFECTED BY AN EXCESS LOAD? At normal weight, the airplane requires a certain angle of attack to maintain straight-and-level flight at a given airspeed. To sustain a heavier load at that same airspeed, the angle of attack must be greater to provide the increased lift that is necessary. More power must be added to overcome the increased drag which results from the increased angle of attack. Additional power, in turn, burns more fuel, thereby reducing the range of the aircraft.

IS CLIMB PERFORMANCE AFFECTED BY AN EXCESS LOAD? Time to climb to a given altitude is lengthened, because extra thrust required to carry the additional weight limits the rate of climb and may limit the climbing speed, since this depends on the surplus power available. The additional time in climbing at the higher power setting also increases the fuel consumption.

IS "G" FORCE TOLERANCE AFFECTED? Assume that your airplane has

2712

a limit-load factor of 3.8 "G's". If the allowable gross weight is not exceeded, this means the wings can safely support 3.8 times the weight of the airplane and its contents. In accelerated flight (pull-ups, turns, turbulent air), the actual load on the wings would be much greater than the normal load, which of course results in much greater stresses in the wing structure. Overloading, therefore, has the effect of decreasing the "G" load capability of the aircraft and thus could result in the wing being stressed to the point of popped rivets, permanent distortion, or structural failure.

HOW IS AN AIRPLANE BALANCED? An airplane, like a steelyard scale, is in perfect balance when the weight is distributed in such a manner that it remains level when freely suspended. In an airplane, however, as long as the center of gravity lies anywhere within specified limits, balance can be maintained in flight. Flight with the CG outside of this range results in unsatisfactory or *dangerous flight characteristics.* Loading an airplane then, is simply a matter of distributing the load so that the CG falls within the allowable range. This can be accomplished by arranging the load in accordance with the Center of Gravity Envelope provided for each airplane.

WEIGHT PROPERLY DISTRIBUTED

EXCESS WEIGHT PLACED AFT

DOES IMPROPER LOADING AFFECT SAFETY? YES! When loading conditions cause the center of gravity to fall outside allowable limits, stability is adversely affected and erratic control forces may develop. Stalling speed, takeoff distance, and landing speed may be increased to the point of *actual danger.*

Due to the size of many baggage compartments there might be a tendency to fill them to capacity, ignoring the placarded baggage weight limitations. This could produce a center of gravity aft of allowable limits creating a highly dangerous flight condition. The result would be a nose high attitude which could lead to a stall from which recovery might not be effected due to inadequate elevator control.

AN AIRPLANE'S BEHAVIOR IN THE AIR IS DEPENDENT ON WEIGHT AND BALANCE!

2713

VFR EXAM-O-GRAM NO. 17

COMMON MISCONCEPTIONS (Series 1)

The following are actual excerpts from a pilot's written report of an accident in which he was involved.

> "I was climbing at an airspeed of 60 mph. I started a climbing turn to the right. The wind now became a cross wind instead of a head wind. This (lack of head wind) caused the airplane to stall—to recover from the stall I turned the airplane back into the wind . . . (Later) I was in a quartering tailwind from the right . . . Went into a second stall . . . This is all I remember."

This pilot had over 100 hours, yet stalled and crashed due to an apparent misuse of controls at a slow airspeed (high angle of attack). The inspector who took this pilot's statement decided to pursue this theory with a group of student pilots. He posed this question to them.

> "If the aircraft's stalling speed was 60 mph and you were flying at an airspeed of 70 mph into a 30 mph wind, what would happen if you maintained this airspeed of 70 mph but turned downwind?"

Five of the six students said the airplane would stall.

IS THIS ANSWER CORRECT? *No.*

IS THE STALLING SPEED OF AN AIRPLANE A FUNCTION OF THE AIRSPEED OR THE GROUND SPEED? *The airspeed.*

DOES THE DIRECTION OF THE WIND HAVE ANY EFFECT ON THE AIRSPEED OF AN AIRCRAFT IN FLIGHT? *No.*

Now to summarize our point: Airspeed is the only speed which holds any significance for an airplane. Once it is off the ground, an airplane feels nothing but its own speed through the air. It makes absolutely no difference what its speed happens to be in relation to the ground. The aircraft in flight feels no wind. It simply proceeds, operating

2714

with the same mechanical efficiency, upwind, downwind, crosswind, or in no wind at all. (NOTE: We are referring here to a steady wind. Turbulence, gusts, or wind shears can lead to stalls even though airspeed is being maintained above the normal stalling speed. In such conditions it is wise to add a safe margin to normal climbout or approach speeds.)

Based on the performance of many applicants on the Private Pilot Written Test, here are some other common misconceptions.

IF IT IS NECESSARY TO CLEAR OBSTRUCTIONS IMMEDIATELY AFTER TAKEOFF, SHOULD YOU USE BEST ANGLE-OF-CLIMB SPEED OR BEST RATE-OF-CLIMB SPEED? *Best angle-of-climb speed.* Simply stated, the difference is this. The best angle-of-climb speed produces the greatest climb in a given distance; the best rate-of-climb speed produces the greatest climb in a given time. Distance, of course, is the determining factor for takeoff obstruction clearance.

DO ALL WIND REPORTS INDICATE A TRUE DIRECTION? *No.* The wind direction, as reported by a control tower in pilot instructions, is magnetic. All other wind directions (Sequence Reports, Terminal Forecasts, Winds Aloft Forecasts, etc.) are true.

WHAT IS THE HEIGHT OF A CLOUD CEILING BASED ON? *The height of the clouds above the ground, not the height above sea level (MSL).* For example, let's examine the following weather report: ABQ M30⊕. The station is Albuquerque, N.M., which has an elevation of 5,352 feet above sea level. The ceiling is reported as a 3,000-foot overcast. Using the current Albuquerque altimeter setting, your altimeter would indicate approximately 8,352 feet at the base of the clouds when over the airport, but your height above the ground would be 3,000 feet. As a word of caution, the 10,000-foot plus mountains a few miles east of the city would probably extend up into the clouds since this ceiling report is based on an observation taken over the airport.

WHICH IS MORE DENSE—MOIST AIR OR DRY AIR? *Dry air.* It is generally understood that high temperatures and high elevations result in a higher density altitude, but there seems to be a general impression that moist air has the reverse effect. The common misconception is that moist air is heavier than dry air. This is not true! Water vapor weighs less than an equal amount of dry air. Dry air is therefore denser and heavier than moist air. Since both engine and aircraft performance decrease with an increase in density altitude, you should remember that high relative humidities (small spreads between temperature and dew point), especially on hot summer days, will result in longer takeoff runs.

IS AN AIRCRAFT CRUISING VFR AT 5,500 FEET MSL ALWAYS GOVERNED BY THE VFR CRUISING ALTITUDE REQUIREMENTS? *Not necessarily.* The rule pertains to aircraft operated in level cruising flight at 3,000 feet or more above the surface. The aircraft in this case (5,500 feet MSL) might be operating above a surface elevation of 3,500 feet. The rule would not apply.

* * * * *

These are, by no means, all of the common misconceptions that prevail among student pilots; but as we stated earlier, a trend has become apparent in the Private Pilot Written Test results which high-lights these that are discussed. Additional misconceptions are discussed in Exam-O-Gram No. 26.

VFR EXAM-O-GRAM NO. 26

COMMON MISCONCEPTIONS (SERIES 2)

Each question in FAA Airman Written Tests offers the examinee a group of four answers from which to select the answer he believes to be correct. Applicant's comments and the analyses of the answer sheets indicate that particular incorrect answers are frequently being chosen because of a misconception regarding certain items of required aeronautical knowledge. This Exam-O-Gram and Exam-O-Gram No. 17 attempt to correct a few of these preconceived ideas.

WHAT INDICATED AIRSPEED SHOULD BE USED FOR LANDING APPROACHES TO FIELDS OF HIGHER ELEVATIONS? For all practical purposes, use the SAME indication as you use at fields of lower elevations.

WILL THE SAME INDICATED APPROACH SPEED BE SAFE AT HIGH ELEVATIONS? YES, in relatively smooth air. We all know that as altitude increases, the air becomes less dense, and consequently with decreased drag the airplane travels faster through the air. However, this faster speed creates no increase in impact pressure on the airspeed pitot system because of the lesser air density. In other words, we get a higher True Airspeed (TAS) with the same Indicated Airspeed.

Although the True Airspeed at which an airplane stalls in thinner air is higher, the margin of safety is unaffected since the airplane is actually flying at a higher True Airspeed. Nevertheless, for the purpose of maintaining positive control in unstable air, the use of a higher than normal indicated speed is recommended for approaches during the turbulent or gusty conditions prevalent in mountainous areas, just as is used at fields of lower elevations in these conditions.

WHAT EFFECT DOES THINNER AIR HAVE ON APPROACH AND LANDING? Even though using the same *indicated* airspeed that is appropriate for sea level operations, the True Airspeed is faster, resulting in a faster groundspeed (with a given wind condition). This increase in groundspeed naturally makes the landing distance longer and should be carefully considered when landing at high elevation fields, particularly if the field is short.

WHAT INDICATED AIRSPEED SHOULD BE USED ON TAKEOFF AT HIGH ELEVATIONS? Just as in landing, the groundspeed, as well as the takeoff distance, will be greater at high elevation fields. However, don't let this mislead you into P-U-L-L-I-N-G the airplane off the ground. If you do, the airplane will mush and settle back to the ground in a stalled condition. Use the same indicated airspeed as you use for takeoff at fields with lower elevations.

WHAT WOULD YOU THINK IF YOU OVERHEARD THIS AIRPLANE "DISCREPANCY" REPORT? "Hey, Chief, fix this goofed-up airspeed indicator! I was practicing power-off stalls with the gear and

2716

flaps down, but the airplane didn't stall until the pointer was 10 mph less than the white arc painted on the dial."

IS THE AIRSPEED INDICATOR FAULTY OR IS THE WHITE ARC MISPLACED? Not necessarily either one! Remember, the colored arcs on the airspeed dial (see Exam-O-Gram No. 8) mark the *Calibrated* Airspeed (CAS) and not merely the observed Indicated Airspeed (IAS) limitations.

WHAT IS CALIBRATED AIRSPEED? Calibrated Airspeed, frequently called True Indicated Airspeed (TIAS), is Indicated Airspeed corrected for installation and instrument error. A wide difference between these speeds may exist, particularly at low airspeeds or under landing conditions. Installation error is caused when the relative wind or impact air in certain pitch attitudes does not enter the pitot-tube opening as it would under normal cruising conditions. Check the airspeed correction data for each airplane. You may find (as in the typical table below) that an IAS of 60 mph is actually a CAS (or TIAS) of 69 mph. (TRUE INDICATED AIRSPEED is not to be confused with TRUE AIRSPEED which is the actual speed of the airplane through the air.)

WHAT IS THE RELATIONSHIP BETWEEN AIRSPEED INDICATOR COLORED ARCS AND STALLING SPEEDS? In the illustration below, the white arc shows a stalling speed of 57 mph (TIAS or CAS), but because of installation error (reflected in the table), this airplane may not stall with power-off and gear and flaps down until the pointer is on 40 mph (IAS).

A similar variation is noted for the green arc and stalling speed with gear and flaps UP. Since an airplane in flight is operated most of the time within the upper speed range, installation error is normally adjusted so as to be at a minimum in that range. This results in the greatest error at the lower speed range, but provides a corresponding increase in the margin of safety at the critical lower airspeeds.

* * * * *

CAN NORMAL IN-FLIGHT ASSISTANCE BE RECEIVED FROM ALL VOR STATIONS? NO. Many VOR stations can be used only for navigation purposes. These stations with no capability to transmit voice signals are so marked on the chart with the notation "NO VOICE." Stations of this type cannot be used for weather information, position reporting, flight plans, or emergency assistance.

IN TERMINAL FORECASTS DOES THE LETTER "C" MEAN CLEAR SKIES? NO. When used in the cloud group of the forecast, it indicates the cloud layer that constitutes the CEILING.

IS THE WIND ALWAYS SHOWN IN

AIRSPEED CORRECTION TABLE

FLAPS 0°								
IAS - MPH	60	80	100	120	140	160	180	200
TIAS - MPH	69	82	100	119	139	160	181	202
***FLAPS 20°**								
IAS - MPH	40	50	60	70	80	90	100	110
TIAS - MPH	57	62	68	75	84	93	102	112
***FLAPS 40°**								
IAS - MPH	40	50	60	70	80	90	100	110
TIAS - MPH	57	62	68	75	83	92	102	111

*Maximum flap speed 110 MPH-TIAS

2717

TERMINAL FORECASTS? NO. If the wind is forecast to be less than 10 knots, it is omitted.

IS THE VISIBILITY ALWAYS SHOWN IN TERMINAL FORECASTS? NO. If the visibility is forecast to be more than 8 miles, it is omitted.

IS THE HEIGHT OF CLOUD TOPS PREDICTED IN TERMINAL FORECASTS? NO. Only the base of the clouds above the surface is predicted. Cloud tops are usually found in Pilot Reports (PIREPS), and often in Area Forecasts.

ARE ICING AND TURBULENT CONDITIONS PREDICTED IN TERMINAL FORECASTS? NO. This information may be found in the Area Forecasts. However, a prediction of gusty surface conditions may be included in the wind group of Terminal Forecasts. A report of existing icing and turbulence at flight levels may be found in PIREPS.

* * * * *

IN TELETYPE FORECASTS AND REPORTS, IS THE WIND INFORMATION RELATIVE TO *TRUE* NORTH OR *MAGNETIC* NORTH? All printed weather information, such as Area Forecasts, Terminal Forecasts, Aviation Weather Sequence Reports, Winds Aloft Forecasts, etc., presents the wind direction as measured from TRUE NORTH. To use this wind direction for the computations of problems in which magnetic values are required, magnetic variation should be applied. That is, add or subtract variation as appropriate to the area involved, when magnetic headings are desired.

IN RADIO BROADCASTS, IS THE WIND DIRECTION RELATIVE TO *TRUE* NORTH OR *MAGNETIC* NORTH? Surface wind direction given in traffic instructions by the tower, or in airport advisories by an FSS, is always given as MAGNETIC direction, so as to be readily related to the runway number which is also a magnetic direction. In scheduled weather broadcasts, the wind is given in True direction for all reported stations except that of the station making the broadcast, in which case the wind is reported in Magnetic direction.

CAN THE DATE AN ANNUAL INSPECTION IS DUE BE DETERMINED FROM AIRWORTHINESS CERTIFICATES? NO. With regard to the due date of an Annual Inspection, the Airworthiness Certificate is of no value unless it was issued within the preceding 12 calendar months. This certificate is issued only when the aircraft is certificated as being airworthy at the time of original manufacture (or after being substantially altered or repaired), and in most cases is issued only once in the lifetime of the aircraft.

FROM WHICH DOCUMENTS CAN THE DUE DATE OF AN ANNUAL INSPECTION BE DETERMINED? By checking the entries in the aircraft and engine maintenance records (in most cases aircraft and engine logbooks) certifying the latest Annual Inspection. If the records show the preceding inspection was performed on April 5, 1967, then the next inspection is due at the end of the 12th month subsequent to the date; that is, by the end of April 30, 1968.

IS THERE A DIFFERENCE BETWEEN AN AIRPORT TRAFFIC AREA AND A CONTROL ZONE? YES, definitely; although in some cases they coincide laterally, in which case rules applicable to each are in effect.

WHAT IS AN AIRPORT TRAFFIC AREA? An Airport Traffic Area is the airspace surrounding an airport at which there is an operating control tower.

The traffic area extends from the surface upward to 2,000 feet, and although not marked on the chart (except by the presence of control tower frequencies), it includes the area within a 5-mile radius from that airport (see Fig. A). When operating within the Airport Traffic Area, a pilot is required, unless otherwise authorized, to maintain two-way radio communications with the tower. This does not apply when operating for the purpose of taking off or landing at airports without a control tower that happen to be within the Airport Traffic Area of another airport. This rule is also not applicable when the tower is *not* in operation nor at airports without control towers outside of an Airport Traffic Area (see Fig. B). The airport traffic *pattern* of an airport is

2718

Airport Traffic Area

(Tower Frequencies)

FIGURE A.

No Airport Traffic Area

FIGURE B.

not to be confused with an Airport Traffic *Area.*

WHAT IS A CONTROL ZONE? A control zone is an airspace, surrounding one or more airports, within which rules additional to those governing flight in control areas and "airport traffic areas," apply for the protection of air traffic. Normally, an aircraft shall not be operated under Visual Flight Rules within a Control Zone *beneath a ceiling of less than 1,000 feet or with a visibility of less than 3 miles.* To do so requires a *special VFR clearance from Air Traffic Control.*

If the airport lies within a Control Zone as well as an Airport Traffic Area (see Fig. C), this clearance is obtained through the control tower. However, *all Control Zones do not have a control tower* or lie within an Airport Traffic Area (see Fig. D). In this case arriving and departing traffic is controlled by ATC either by direct communication between the control center and the pilot, or through an appropriate radio facility. Frequently, clearances are conveyed to an aircraft by a nearby Flight Service Station (FSS). All Control Zones are marked on charts by a circular broken line, normally a 5-mile radius with extensions as necessary for IFR approaches, extending from the *surface upward* (*with no vertical limits*), and may encompass more than one airport. These special rules are also applicable to the other airports within the Control Zone boundaries.

VFR EXAM-O-GRAM NO. 28

FACTORS AFFECTING STALL SPEED

A recent report indicates that approximately 80 percent of all accidents are pilot caused. The major cause of fatal accidents is listed as "failed to maintain airspeed (or flying speed) resulting in a stall." Although many of these stalls may have occurred under the stress and duress of other problems such as disorientation during limited visibility or at night, improper division of attention, etc., statistical analyses of written tests indicate a lack of knowledge and understanding of the various factors that can cause or contribute to a stall.

This Exam-O-Gram discusses some of the more important, ever-present factors of which the pilot must have an understanding so that he will instinctively avoid or compensate for situations, conditions, and attitudes that may lead to a stall—even under the stress and duress of additional problems he may encounter in flight.

WHAT CAUSES AN AIRPLANE TO STALL? All stalls are caused by exceeding the critical angle of attack. Knowing this particular fact does not necessarily help the pilot. What is more important to the pilot is to know what factors are likely to contribute to or cause this angle of attack to be exceeded.

IS IT NECESSARY FOR THE AIRPLANE TO HAVE A RELATIVELY LOW AIRSPEED IN ORDER FOR IT TO STALL? No. An airplane can be stalled *at any airspeed.* All that is necessary is to exceed the critical angle of attack. This can be done at any airspeed if the pilot applies abrupt or excessive back pressure on the elevator control. A stall that occurs at a relatively high speed is referred to as an accelerated or high speed stall.

IS IT NECESSARY FOR THE AIRPLANE TO HAVE A RELATIVELY HIGH PITCH ATTITUDE IN ORDER FOR IT TO STALL? No. An airplane can be stalled *at any attitude.* Repeating again the statement made above—all that is necessary is to exceed the critical angle of attack. This can occur in any attitude by application of abrupt or excessive back pressure on the elevator control.

DOES WEIGHT AFFECT THE STALLING SPEED? Yes. As the weight of the airplane is increased, the stall speed increases. Due to the greater weight, a higher angle of attack must be maintained to produce the additional lift to support the additional weight in flight. Therefore, the critical angle of attack will be reached at a higher airspeed when loaded to maximum gross weight than when flying solo with no baggage. (See Exam-O-Gram No. 13.)

DOES THE CENTER-OF-GRAVITY LOCATION (WEIGHT DISTRIBUTION) AFFECT STALL SPEED? Yes. The farther forward the center of gravity, the higher the stalling speed. The farther aft the center of gravity, the lower the stalling speed. (See Exam-O-Gram No. 13.)

DOES THIS MEAN THAT THE WEIGHT SHOULD BE DISTRIBUTED IN THE AIRPLANE SO THAT THE CG IS AS FAR TO THE REAR AS POSSIBLE? No. This may present problems with stability that will far outweigh any advantages obtained by the decrease in stall speed. (See Exam-O-Gram No. 13.)

DO FLAPS AFFECT STALLING SPEED? Yes. The use of flaps reduces stalling speed. The Stall Speed Chart on the next page, which is excerpted from an airplane flight manual illustrates this fact. This also can be readily verified by checking the color coding on any airspeed indicator.

2720

The lower airspeed limit of the white arc (power-off stalling speed with gear and flaps in the landing configuration) is less than the lower airspeed limit of the green arc (power-off stalling speed in the clean configuration). (See Exam-O-Gram No. 8.) This fact is important to the pilot in that when making no-flap landings, a higher indicated airspeed should be maintained than when landing with flaps.

The manufacturers' recommendations should be adhered to as to approach speeds with various configurations.

DOES AN ACCUMULATION OF FROST, SNOW, OR ICE ON THE WINGS AFFECT STALLING SPEED? Yes. Even a light accumulation of frost, snow, or ice on the wings can cause a significant increase in stalling speed. It can increase it so much that the airplane is unable to take off. The accumulation disrupts the smooth flow of air over the wing thus decreasing the lift it produces. To make up for the lost lift, a higher angle of attack must be used or a higher speed must be attained on the takeoff roll.

The runway may not be long enough to attain the necessary speed and even though the airplane may become airborne, it could be so close to the stall speed that it would not be possible to maintain flight once the airplane climbs above the comparatively shallow zone where ground effect prevails. DO NOT TAKE OFF UNTIL ALL FROST, SNOW, AND ICE HAS MELTED OR BEEN REMOVED FROM THE AIRPLANE.

DOES AN INCREASE IN ALTITUDE AFFECT THE INDICATED AIRSPEED AT WHICH AN AIRPLANE STALLS? An increase in altitude has no effect on the *indicated airspeed* at which an airplane stalls at altitudes normally used by general aviation aircraft. That is, for all practical purposes, the indicated stalling speed remains the same regardless of altitude in this range. This fact is important to the pilot in that the same indicated airspeed should be maintained during the landing approach regardless of the elevation or the density altitude at the airport of landing. (Follow the manufacturer's recommendations in this regard.) If higher than normal approach airspeed is used, a longer landing distance will be required.

DOES AN INCREASE IN ALTITUDE AFFECT THE TRUE AIRSPEED AT WHICH AN AIRPLANE STALLS? Since true airspeed normally increases as altitude increases (for a given indicated airspeed), then true airspeed at which an airplane stalls generally increases with an increase in altitude. Under nonstandard conditions (temperature warmer than standard) there is an additional increase in true airspeed above the indicated airspeed.

OF WHAT SIGNIFICANCE IS THIS TO THE PILOT? It is significant in that when landing at higher elevations or under higher density altitudes, he is operating at higher true airspeeds (and therefore higher groundspeeds) throughout the approach, touchdown, and landing roll. This results in a greater distance to clear obstacles during the approach, a longer ground roll, and consequently, the need for a longer runway. If, in addition, the pilot is operating under the misconception that a higher than normal indicated airspeed should be used under these conditions, the situation is further compounded due to the additional increase in groundspeed (See Exam-O-Gram No. 26.)

DOES TURBULENCE AFFECT STALLING SPEED? Yes! Turbulence can cause a big increase in stalling speed. Encountering an upward vertical gust causes an abrupt change in relative wind. This results in an equally abrupt increase in angle of attack which could result in a stall. This fact is important to the pilot in that when making an approach under turbulent conditions, a higher than normal approach speed should be maintained. Also, in moderate or greater turbulence, an airplane should not be flown above maneuvering speed. (See Exam-O-Gram No. 8.) At the same time, it should not be flown too far below maneuvering speed since a sudden severe vertical gust may cause an inadvertent stall due to the higher angle of attack at which it will already be flying.

DOES ANGLE OF BANK AFFECT STALLING SPEED? Yes. As the angle of

2721

bank increases in a constant altitude turn, the stalling speed increases. This is easily seen from the STALL SPEED CHARTS which show the increase in stall speed as the angle of bank increases, one in the actual values for one airplane, and the other in terms of percent. At a 60° bank, stalling speed is 40 percent greater than in straight-and-level flight (25–27 mph for the specific example.) At angles of bank above 60°, stall speed increases very rapidly, and at approximately 75° it is doubled with respect to straight-and-level stall speed. (See Stall Speed Chart below.)

STALL SPEED, POWER OFF

Gross Weight 3000 *lbs.*	ANGLE OF BANK			
CONFIGURATION	0°	20°	40°	60°
GEAR & FLAPS UP	65	67	74	92
GEAR DOWN, FLAPS 20°	61	63	70	86
GEAR DOWN, FLAPS 40°	60	62	69	85

SPEEDS ARE MPH, TIAS

DOES LOAD FACTOR AFFECT STALLING SPEED? Yes. As the load factor increases, stalling speed increases. When the load factor is high, stalling speed is high. A comparison of the load factor and stall speed charts should easily show this relationship. Load factor is the ratio of the load supported by the wings to the actual weight of the airplane. At a load factor of 2, the wings support twice the weight of the airplane; at a load factor of 4, they support four times the weight of the airplane. Normal category airplanes with a maximum gross weight of less than 4,000 pounds are required to have a minimum limit load factor of 3.8. (The limit load factor is that load factor an airplane can sustain without taking a permanent set in the structure.) Note from the load factor chart that this minimum limit load factor is attained in a constant altitude turn at a bank of approximately 75°.

Also note from the Stall Speed Chart below that at this angle of bank, the stall speed is twice as great as in straight-and-level flight.

There are two reasons then why excessively steep banks should be avoided: an airplane will stall at a much higher airspeed and the limit load factor can be exceeded. The danger can be compounded when the nose gets down in a steep turn if the pilot attempts to raise it to the level flight attitude without shallowing the bank since the load factor may be increased even more. This is the situation as it generally exists when, due to disorientation, the pilot enters a diving spiral (often referred to as the "graveyard spiral") and attempts to recover with elevator pressure alone.

WHAT FACTORS CAUSE AN INCREASE IN LOAD FACTOR? Any maneuvering of the airplane that produces an increase in centrifugal force will cause an increase in load factor. Turning the airplane or pulling out of a dive are examples of maneuvering that will increase the centrifugal force and thus produce an increase in load factor. When you have a combination of turning and pulling out of a dive, such as recovering from a diving spiral, you are, in effect, placing yourself in double jeopardy. This is why you must avoid high-speed diving spirals or if you accidentally get into one—be careful how you recover. Turbulence also can produce large load factors. This is why an airplane should be slowed to maneuvering speed when encountering moderate or greater turbulence.

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963-A

CAN THE PILOT RECOGNIZE WHEN THERE IS AN INCREASE IN LOAD FACTOR? Yes. He can recognize it by the feeling of increased body weight or the feeling that he is being forced down into the seat—the greater the load factor the greater this feeling of increased weight or of being forced down in the seat. It is the same feeling one has when riding the roller coaster at the bottom of a dip or going around a banked curve. This feeling of increased body weight is important to the pilot because it should, if it becomes excessive, have the immediate effect of a red flag being waved in his face to warn him that the airplane will now stall at a higher airspeed or that the limit load factor can be exceeded, resulting in structural failure.

DOES SPEED AFFECT LOAD FACTOR? Speed does not, in itself, affect load factor. However, it has a pronounced effect on how much of an increase in load factor can be produced by strong vertical gusts, or by the pilot through abrupt or excessive application of back pressure on the elevator control. This is why airspeed should be reduced to design maneuvering speed if moderate or greater turbulence is encountered.

At maneuvering speed, the airplane is stressed to handle any vertical gust that will normally be encountered. Also, at or below this speed, the pilot can make abrupt full deflection of the elevator control and not exceed the maximum load factor for which the airplane is stressed. However, it should be noted that the reason this is possible is because the airplane will stall, thus relieving the load factor. At airspeeds above maneuvering speed, abrupt full deflection of the elevator control or strong vertical gusts can cause the limit load factor to be exceeded. As airspeed continues to increase above maneuvering speed, the limit load factor can be exceeded with less and less turbulence or abrupt use or deflection of the controls.

WHAT IS THE RELATIONSHIP BETWEEN A HIGH-SPEED (ACCELERATED) STALL AND LOAD FACTOR? The higher the airspeed when an airplane is stalled, the greater the load factor. When an airplane stalls at a slow airspeed, the load factor will be very little more than one. When stalled at an airspeed twice as great as the normal stall speed, the limit load factor for normal category airplanes probably will be exceeded. This fact can be determined from the stall speed and load factor charts. See also the discussion of "How Does Load Factor Affect Stalling Speed."

ABSTRACT - Developed by the Flight Standards Service of the Federal Aviation Administration to assist applicants for multiengine ratings in preparing for certification or rating flight tests, this guide provides explanations of the procedures and maneuvers required for a pilot flight test in a multiengine airplane. Following general information on the guide, each of the three phases of the test presents a number of required items with each requirement discussed in terms of its objective, description, and acceptable performance. Phases are (1) Oral Operational Test (six requirements), (2) Basic Piloting Techniques (eight requirements), and (3) Multiengine Emergency Procedures (six requirements). The guide may be used by both prospective flight test applicants and their flight instructors. (AW)

PREFACE

This Guide has been developed by the Flight Standards Service of the Federal Aviation Administration to assist the applicant for a multiengine rating in preparing for his certification or rating flight test.

It provides explanations of the procedures and maneuvers required by Part 61 of the Federal Aviation Regulations for a pilot flight test in a multiengine airplane, which should make it helpful to both prospective flight test applicants and their flight instructors.

This edition revises and supersedes the edition dated 1966, and all other previous issuances concerning multiengine flight tests, including Advisory Circular No. 61-40, *Performance of Stalls on Pilot Flight Tests*, as it applies to tests in multiengine airplanes.

Persons using this Guide to prepare for a pilot flight test should refer to the latest revisions of Part 61 for the procedures and maneuvers which will be required.

MULTIENGINE AIRPLANE CLASS OR TYPE RATING

This Guide describes the acceptable performance of flight maneuvers and procedures on flight tests for the addition of multiengine ratings to Private and Commercial Pilot Certificates. Flight tests in multiengine airplanes for the issuance of Private and Commercial Pilot Certificates will be conducted in accordance with the appropriate *Private Pilot* or *Commercial Pilot Flight Test Guide*, using the descriptions contained in this Guide for the performance of those of the required maneuvers which are different for multiengine airplanes. The flight maneuvers and procedures required for Private and Commercial Pilot Certificates are prescribed in Sections 61.87 and 61.117 of the Federal Aviation Regulations.

The multiengine rating flight test described in this Guide is arranged in three phases: *Oral Operational Test*, *Basic Piloting Technique*, and *Multiengine Emergency Procedures*. The failure of any required item constitutes the failure of the phase involved, and of the flight test. A flight test may be discontinued at any time by the examiner or the applicant, but in the event of failure or an incomplete test, credit will be allowed on sub-

1675 2730

sequent reexamination for each successfully completed phase.

The section on each procedure or maneuver contains three paragraphs: *Objective*, *Description*, and *Acceptable Performance:*

The *Objective* states briefly the reason why the procedure or maneuver is required on the flight test. It specifies the principles which the applicant must apply, and the piloting operations which he must perform properly to demonstrate that he has mastered this element of pilot qualification.

The *Description* explains the procedure and means which have been found most effective in accomplishing and demonstrating the objectives of the procedure or maneuver. These descriptions must not be confused with the objectives. How one enters a stall, for example, is not so important as is his demonstration of the ability to recognize stalls and to use the proper recovery techniques, which are the objectives of the maneuver.

The *Acceptable Performance* describes the factors which are taken into account by the examiner in deciding whether the applicant has met the objectives of the procedure or maneuver. The airspeed, altitude, and heading tolerances are not hard-and-fast, but represent the performance to be expected in good flying conditions in a typical personal type airplane. The practice of consistently exceeding these tolerances before corrective

2730 2731

action is initiated, however, is indicative of an unsatisfactory performance.

For flight tests conducted in multiengine airplanes with engines in tandem on or near the centerline of the fuselage, engines geared to a single propeller, or airplanes with jet engines in or on the fuselage, flight test procedures appropriate to the airplane type will be required.

A flight instructor's written recommendation is required by FAR 61.21 for each pilot flight test, except a test for the addition of a type rating only to a pilot certificate.

The applicant is required to provide a properly certificated airplane, bearing no limitations or restrictions which prevent its use for the test. A military aircraft on operational status is acceptable, provided its use is authorized by the appropriate military authority. The airplane should be equipped with such radio, instrumentation, and check list as is necessary for the required flight test operations. Fully functioning dual controls are required by FAR 61.25(b), unless, after considering all factors, the examiner determines that the flight test can be conducted safely without them.

PHASE I.

ORAL OPERATIONAL TEST

1. Airplane Registration, Airworthiness, and Equipment Documents

a. *Objective.* To determine that the applicant can identify and find the documents required in a certificated airplane.

b. *Description.* The applicant will be requested to present or point out in the airplane the aircraft registration, airworthiness certificate, *Airplane Flight Manual* (if required), equipment list, and weight and balance documents required to be carried in the airplane.

c. *Acceptable Performance.* The applicant should be able to identify, find, and explain the purpose and significance of each required document.

2. Airplane Logbooks and Airworthiness Inspection Records

a. *Objective.* To determine that the applicant knows what airworthiness inspections are required for a certificated airplane, and what evidence of these inspections is acceptable for flight operations.

b. *Description.* The applicant will be required to present and explain the aircraft and engine logbooks, or other required airworthiness inspection reports.

2733

c. *Acceptable Performance.* The applicant should be able to identify, find, and explain the significance, to the pilot, of the required inspection reports.

3. Airplane Performance, Range, and Operation

a. *Objective.* To determine that the applicant knows what performance data and operating information is important to the pilot, and can obtain them for the airplane to be used for the test.

b. *Description.* The applicant will be required to demonstrate a practical knowledge of the performance capabilities, approved operating procedures, and limitations for the airplane furnished. This includes power settings, placard speeds, range, fuel and oil requirements, the operation of aircraft systems and special equipment, critical engine-out control and climb speeds, and other emergency procedures.

The applicant will be expected to use the *Airplane Flight Manual*, if available, to determine the effects of temperature, density altitude, wind, surface conditions, and gross weight on flight performance. He is expected to be familiar with the effects of power settings and altitude on the cruising range, and to know the airspeeds for best performance in the airplane used. Special attention will be devoted to the performance data on flight control and performance with an engine inoperative.

A practical knowledge of the control system; the fuel, lubrication, hydraulic,

2734

and electrical systems; the operation of the supercharger(s), landing gear, and flaps, radio, pressurization, heating, and ventilation installations; and of the fire control, deicing and anti-icing, and other emergency equipment appropriate to the type of airplane used will be required.

c. *Acceptable Performance.* The inability to obtain essential pilot information which is available in the airplane, or a faulty knowledge of operating data or procedures is disqualifying.

4. Airplane Loading, Including Fuel, Oil, and Baggage Capacities

a. *Objective.* To determine that the applicant can make practical, accurate determinations of permissible loading and load distribution in an airplane.

b. *Description.* The applicant will be required to apply the approved weight and balance data for the airplane used on the test to make practical computations of the permissible fuel and payload distribution. A loading graph or computer designed for the airplane may be used for this purpose.

c. *Acceptable Performance.* The applicant should be able to make accurate determinations of permissible gross weight loadings, and load distribution.

5. Airplane Line Check

a. *Objective.* To establish that the applicant can make a practical determination that the airplane is ready for flight.

b. *Description.* The applicant will be

2735

expected to use an orderly procedure in conducting a preflight check of the airplane, preferably in accordance with a check list provided by the manufacturer or operator. This check covers the airplane's readiness for flight, including fuel and oil supply, the presence of all required equipment and documents, and its airworthiness so far as can be determined by external inspection.

c. *Acceptable Performance.* The applicant should know the significance of each item checked, and not overlook any obvious unairworthy condition. He should know the appropriate remedial action for a pilot to initiate for the correction of each unsatisfactory item detected.

6. Use of Radio for Voice Communication.

a. *Objective.* To determine that the applicant can use two-way radio effectively for ground and flight communications.

b. *Description.* During his flight test, the applicant will be expected to use two-way radio for information, clearances, and requests pertinent to the flight.

c. *Acceptable Performance.* Performance will be evaluated on the basis of the applicant's ability to determine and tune in the correct radio frequencies, and his use of appropriate radio procedures and phraseology.

PHASE II.

BASIC PILOTING TECHNIQUES

1. Preflight Operations

a. *Objective.* To determine that the applicant knows how to start and warm up the engines, and to determine the airplane's immediate readiness for flight.

b. *Description.* The applicant will be expected to perform the proper procedures for the airplane used in engine starting, warmup, and runup; the setting of the airplane systems and equipment; and the check of the flight controls.

c. *Acceptable Performance.* The procedures used should be correct and thorough, and should be conducted in accordance with an appropriate checklist. Performance will be evaluated on the basis of the accuracy of the procedures used, and the thoroughness of the engine, systems, and airplane checks.

2. Taxiing, or Sailing and Docking

a. *Objective.* To determine that the applicant has the ability to maneuver the airplane expeditiously and safely on the surface.

b. *Description.* The demonstration of taxiing will include the operation of the airplane on the surface, the initial and continuing determination that the taxi

2737

path is clear of obstructions, and compliance with local taxi rules and control tower instructions.

Seaplane applicants will be required to demonstrate taxiing at slow speeds and on the step, sailing, docking, a simulated or actual approach to a buoy, and turns to downwind headings.

c. *Acceptable Performance.* Performance will be evaluated on the basis of the accuracy of taxi operations; safety; consideration for other aircraft and personnel on ramps and taxiways; the use of power, brake, and flight controls for directional control; and the proper use of nosewheel steering, tailwheel lock, or water rudder, if the airplane is so equipped.

3. Normal and Crosswind Takeoffs and Landings

a. *Objective.* To determine that the applicant is able to make consistently safe takeoffs and landings under all normally anticipated conditions.

b. *Description.* The applicant will be required to demonstrate normal and crosswind takeoffs and landings. If all takeoffs and landings must be made with sufficent crosswind to require the use of crosswind techniques, no separate demonstrations will be required. For safety, crosswind takeoffs and landings must be performed with full consideration for other air traffic, and in strict compliance with the crosswind component limitations for landings in the airplane used.

Landings will be required at various

2738

flap settings, including a no-flap landing if permitted by the airplane's operating limitations.

The applicant will also be required to demonstrate maximum performance (short field) takeoffs and landings. Lift-off should be initiated just below the all-engine best angle of climb speed, unless it is slower than the engine-out minimum control speed, in which case the engine-out minimum control speed should be used. The best all-engine angle of climb speed should be attained, and maintained to the height of an assumed obstruction, such as a fence or row of trees, after which normal climb speed should be smoothly attained.

For short field landings, the final approach from an altitude of at least 50 feet above the surface should be made at approximately 1.3 times the power-off stalling speed with gear and flaps extended. Descent should be controlled primarily with the throttles and the airspeed with the elevators. The round-out for landing should be accompanied by a smooth closing of the throttles, and result in little or no floating.

c. *Acceptable Performance.* Performance will be evaluated on the basis of takeoff and landing technique, judgment, observance of traffic patterns and control tower instructions, drift correction, coordination, and smoothness. Excessive maneuvering, faulty operation of aircraft controls or systems, or the use of improper airspeeds will be disqualifying.

4. Emergency Go-arounds

a. *Objective.* To determine that the applicant can operate all systems correctly when abandoning a landing approach and going around again in the event of an emergency, such as an unexpected obstruction on the runway.

b. *Description.* Just prior to touchdown in landing configuration, the examiner will direct the applicant to execute a go-around without prior notice. The execution of a go-around with a simulated engine failure will not be required.

c. *Acceptable Performance.* The applicant's performance will be evaluated on the basis of his ability to maintain the appropriate airplane control and performance speeds, the correct handling of the flaps and gear, and the use of correct power and trim settings. Climbing higher than necessary to clear immediate obstructions at less than the minimum engine-out control speed will be disqualifying.

5. Maneuvering at Minimum Controllable Airspeed

a. *Objective.* To determine the applicant's ability to recognize and maintain safe flight control at marginally slow airspeeds, and to make the transition from cruising to landing approach speeds smoothly.

b. *Description.* The applicant will be required to maneuver the airplane at an airspeed not more than 10 knots above the stalling speed in cruise and in landing

2740

configurations. The transition from and to cruising configuration and airspeed in straight and level flight will be required.

c. *Acceptable Performance.* During maneuvers at minimum controllable airspeed, the applicant will be expected to maintain a speed within 5 knots of the desired airspeed, and an altitude within 100 feet of the original altitude. In straight and level flight and during the transition to and from the minimum controllable airspeed, he will be expected to maintain a heading within 10 degrees of the original heading. Consideration will be given to the applicant's use of the proper trim and power settings. Any unintentional stall will be disqualifying.

6. Stalls and Partial Stalls

a. *Objective.* To determine that the applicant can recognize a partial stall, and make prompt, effective recoveries from partial and complete stalls.

b. *Description.* The applicant will be required to demonstrate stalls entered with at least 65 percent power and with power reduced on all engines, in landing and in cruising configurations. Stalls should be entered by increasing the angle of attack smoothly, so that the airspeed decreases at a uniform rate. Sufficient power may be used throughout all stalls to keep the engines running smoothly.

No stall will be required with any engine throttled or cut off and the other engine(s) developing effective power. Abrupt pitch changes during stall dem-

2741

onstrations, and all other maneuvers, should be avoided in airplanes with extensions between the engine and the propeller, because of the high gyroscopic loads induced.

Recoveries should be initiated at the first physical indication of a stall, such as uncontrollable pitching, buffeting, rapid decay of control effectiveness, or the application of full back elevator without producing further stall development. The applicant should control the attitude of the airplane to the maximum extent possible throughout the stall and recovery by the normal use of the flight controls. Emphasis will be placed on the recovery from a stabilized high rate of descent in a high pitch attitude, if this condition develops in some flight situations in the airplane used.

Stall recoveries should be accomplished positively and smoothly, with coordinated flight control usage, the smooth application of power, and the least loss of altitude consistent with the prompt recovery of control effectiveness.

c. *Acceptable Performance.* Throughout stall demonstrations, the applicant will be expected to use prompt and correct control applications to achieve the desired attitudes and maintain the desired heading. Consideration will be given to the applicant's positive action and smoothness. Failure to initiate corrective action on partial stalls before the nose pitches uncontrollably, indications of a secondary

2742

b. *Description.* The applicant for a type rating will be required to demonstrate the competent performance of the following procedures and maneuvers solely by reference to instruments:

i. Recovery from unusual flight attitudes,

ii. Stall recoveries,

iii. A standard instrument approach,

iv. Maneuvering with one engine inoperative—propeller feathered or power reduced to simulate the drag of a feathered propeller—, and

v. Instrument emergencies.

c. *Acceptable Performance.* The standards for the performance of these procedures and maneuvers will be in accordance with those in the FAA *Instrument Pilot Flight Test Guide.*

6475 2744

PHASE III.
MULTIENGINE EMERGENCY PROCEDURES

1. Maneuvering with One Engine Out (Feathered if Possible)

a. *Objective.* To determine that the applicant can use the correct procedures for feathering or shutting down an engine in flight, and that he can maneuver an airplane effectively and safely with an engine inoperative.

b. *Description.* The feathering of one propeller will be required on a flight test in any multiengine airplane equipped with propellers which can be safely feathered and unfeathered in flight. Feathering for pilot flight test purposes will be required only under such conditions and at such altitudes and positions where safe landings on established airports can be readily accomplished in the event difficulty is encountered in unfeathering.*

If the airplane used is not equipped with propellers which can be safely feath-

*NOTE: The regulations do not specifically require an applicant to unfeather a propeller on a flight test. Accordingly, he will not be required to do so if he elects to land with a propeller feathered. If he desires to use this procedure, he should arrange it in advance with the examiner concerned, who will permit it unless he considers that an undue hazard would be involved.

2745

ered or unfeathered in flight, the applicant will be required to shut down one engine in flight in accordance with the procedures in the *Airplane Flight Manual.*

While one engine is feathered or shut down, the applicant will be required to demonstrate straight and level flight, and 20° to 30° banked turns toward and away from the inoperative engine. Climbs and descents to prescribed altitudes will be required in airplanes which are capable of climbing under the existing conditions.

The prescribed propeller operation procedures will be expected, as well as the emergency settings of all ignition, fuel, electrical, hydraulic, and fire extinguishing systems appropriate to an engine failure.

c. *Acceptable Performance.* The applicant's performance will be evaluated on the basis of his ability to maintain his heading within 20 degrees of the original heading during his feathering and unfeathering procedures, and his altitude within 100 feet of the original altitude if it is within the capability of the airplane used; prompt indentification of the inoperative engine after a simulated power failure; and the accuracy of his shutdown and restart procedures, as prescribed in the *Airplane Flight Manual.* In an airplane not capable of maintaining altitude with an engine inoperative under existing circumstances, the applicant will be ex-

2746

pected to maintain an airspeed within 5 knots of the engine-out best rate-of-climb speed. The use of prescribed operating procedures, proper trim settings, and smoothness will be emphasized.

2. Engine-Out Minimum Control Speed Demonstration

a. *Objective.* To determine that the applicant knows the significance of the engine-out minimum control speed, and the effect of attempts to maintain flight at a slower speed with an engine inoperative.

b. *Description.* With the critical engine (usually the left) windmilling (not cut off), and the operating engine(s) producing as near takeoff rated power as possible, the airspeed should be reduced slowly with the elevators until an uncontrollable turn or bank toward the inoperative engine or indication of a stall is encountered, whichever occurs first. The airspeed at which uncontrollable turning or banking occurs is the engine-out minimum control speed for the conditions under which the demonstration is conducted. Continued controlled flight is impossible at a slower airspeed unless the difference between the power produced by the engines is reduced. Recovery should be effected by reducing the power on the operating engine and effectively reducing the angle of attack by lowering the nose slightly.

Great caution must be observed when it is seen that the engine-out minimum control speed under existing conditions is

2747

very close to the stalling speed. Loss of directional control at the instant of a stall can lead to a sudden power spin.

To obtain an engine-out minimum control speed as far as possible above the stalling speed, it is necessary to perform this demonstration under conditions in which the engines will produce as nearly their rated power as possible. For this reason, it is most effective to use as low an altitude as is operationally safe in airplanes with unsupercharged engines. The examiner will arrange to start this demonstration at such an altitude that the engine-out minimum control speed is not attained below 500 feet above the ground.

In all unsupercharged airplanes, there is a density altitude above which the stalling speed is higher than the engine-out minimum control speed. When this is the case because of the high elevation or temperature at which the flight test must be given, an effective demonstration of the engine-out minimum control speed is impossible and will not be attempted.

c. *Acceptable Performance.* The engine-out minimum control speed demonstration is subject to so much variation because of the differences in airplane characteristics, circumstances of flight, and elevation of terrain over which flight tests are conducted that definitive standards cannot be established. Any attempt, however, to continue level or climbing flight with an engine inoperative during the flight test at less than the engine-out

2748

minimum control speed will be disqualifying.

3. Use of Engine-Out Best Rate-of-Climb

a. *Objective.* To determine that the applicant knows and can effectively apply the best rate-of-climb airspeed for the airplane used.

b. *Description.* The applicant will be required to establish and maintain the best possible rate of climb (or minimum rate of sink) with one engine throttled to simulate the drag of a feathered propeller, or with a propeller feathered by mutual agreement between the applicant and examiner. This climb should be maintained for at least three minutes after the airspeed is established, at maximum continuous power, and the resulting climb carefully noted. He may then be asked to attempt to gain more altitude at higher or lower airspeeds of his own choosing or selected by the examiner, for comparison with the airspeed initially selected.

c. *Acceptable Performance.* Performance will be evaluated on the basis of the applicant's ability to determine (from the *Airplane Flight Manual*) and maintain the prescribed engine-out best rate-of-climb speed. He will be expected to maintain a climb within 5 knots of the best rate-of-climb speed within 10 degrees of the desired heading.

4. Effects of Airplane Configuration on Engine-Out Performance

a. *Objective.* To determine that the

2749

applicant is aware of the detrimental effects on engine-out performance of various common airplane configurations, and to prepare him to evaluate these effects in unfamiliar airplanes.

b. *Description.* The airplane should be trimmed to its engine-out best rate-of-climb speed with the power on one engine throttled to simulate the drag of a feathered propeller, or with a propeller feathered. The effects of the extension of the landing gear, the flaps, and both; the application of carburetor heat on the operating engine(s); and the windmilling of the inoperative engine should be observed and the resulting climb or descent carefully noted. The difference between the gear and the flap extension drag should be emphasized. Each configuration will be maintained long enough to allow its effect to stabilize before the resulting climb or descent is measured. Prolonged use of carburetor heat should be avoided at high power settings.

c. *Acceptable Performance.* Performance will be evaluated on the basis of the accuracy of operations and trim procedures used, and on the applicant's ability to maintain an airspeed within 5 knots of the best rate-of-climb speed and a heading within 10 degrees of the assigned heading.

5. Engine-Out Approach and Landing

a. *Objective.* To determine the applicant's ability to execute a safe approach and landing after the failure of an engine.

2750

b. *Description.* The applicant will be required to demonstrate an approach and landing with one engine inoperative. In the event the applicant has elected to land with a propeller feathered after demonstrating propeller feathering under paragraph 1 of Phase III, no further demonstration will be required. Otherwise, the landing may be made with an engine throttled to simulate the drag of a feathered propeller or, if feathering propellers are not installed, with an engine throttled to idling. The approach will be continued to a normal landing, and no go-around with an engine out will be required unless there is an actual emergency.

c. *Acceptable Performance.* Performance will be evaluated on the basis of the correct operation of the airplane systems, the use of appropriate trim settings, observance of the regular traffic pattern or approach path, airspeed and altitude control, accuracy of touchdown, and control during rollout. Any reduction of airspeed below the engine-out minimum control speed before the landing flare is initiated will be disqualifying.

6. Emergency Operations (Aircraft Systems)

a. *Objective.* To determine that the applicant is familiar with the emergency operation of all regular and special systems in the airplane used for the test.

b. *Description.* The applicant will be required to demonstrate the actual emergency operation of the retractable gear;

2751

flaps; and electrical, fuel, deicing, and hydraulic systems. Emergency operations such as the use of CO_2 pressure for gear extension, or the discharge of a pressure fire extinguisher system will be simulated only.

On flight tests in pressurized airplanes, the applicant will be required to execute an emergency descent, as might be necessitated by a loss of pressurization, in accordance with the procedures prescribed by the *Airplane Flight Manual.* The descent will be initiated and stabilized, but no prolonged descent will be required. The airspeed or Mach number used for the demonstration of an emergency descent will be approximately 10 percent less than the airplane's structural limitation, to provide a margin for error. When a Mach limitation is controlling at operational altitudes for the airplane used, the descent will be arranged, if practicable, to require the transition from the observance of the Mach limitation to an airspeed limitation. No simulated emergency descent will be permitted through or near clouds.

c. *Acceptable Performance.* Performance will be evaluated on the basis of the applicant's knowledge of the emergency procedures for the airplane used, the judgment displayed, and the accuracy of his operations.

VT 012 137
Fire Fighting Manual for Tank Vessels.

Coast Guard (Dept. of Transportation), Washington, D.C.
MF AVAILABLE IN VT-ERIC SET.
CG-329
PUB DATE - 1Jul68 48p.

DESCRIPTORS - *RESOURCE MATERIALS; MANUALS; *TECHNICAL EDUCATION; *FIRE FIGHTERS; *FIRE PROTECTION; *FIRE SCIENCE EDUCATION; SEAMEN; MARINE TECHNICIANS

ABSTRACT - Prepared jointly by the American Petroleum Institute and the U.S. Coast Guard, this manual is intended to aid seagoing personnel in familiarizing themselves with the nature and hazards of fire, the characteristics and limitations of different types of fire-fighting equipment, and methods by which various fire hazards may be controlled most effectively. Chapters are: (1) The Chemistry of Fire and Fire Fighting, (2) Characteristics of Cargo, (3) Fire Fighting Agents and Equipment, (4) Fighting Fires, and (5) Case Histories of Tanker and Barge Fires and Explosions. A listing of Coast Guard District Commanders and Merchant Marine Activities is appended. The manual is illustrated with numerous figures, diagrams, drawings, and photographs. Recommended supplementary materials are "Rules and Regulations for Tank Vessels," Subchapter D, CG-123, which is available upon request from local Coast Guard Marine Inspection Offices, the annual Dangerous Cargo Regulations section of the Code of Federal Regulations, and the pamphlet, "Chemical Data Guide For Bulk Shipment by Water," CG-388, the latter two available from the Superintendent of Documents, Government Printing Office, Washington, D.C., for $2.50 and $1.25 respectively. FOREWORD

The "Fire Fighting Manual for Tank Vessels" is intended to aid and help seagoing personnel to familiarize themselves with the nature and hazards of fire, the characteristics and limitations of different types of fire-fighting equipment, and the methods by which various fire hazards may be controlled most effectively. Certain portable and fixed fire-fighting equipment are required to be provided on tank vessels. The use and operation of shipboard fire-fighting equipment are responsibilities of the Master and his crew.

Readers are urged to supplement the material contained in this manual with the "Rules and Regulations for Tank Vessels," Subchapter D, CG-123, which may be obtained upon request from the local Coast Guard Marine Inspection Office. The regulations governing carriage of flammable and combustible liquids, liquefied flammable gases and other dangerous commodities in drums, barrels, cases and other packages are contained in Subchapter N—Dangerous Cargoes of Chapter 1 of Title 46 of the Code of Federal Regulations. These Dangerous Cargo Regulations are published annually, with the latest edition having an effective date of January 1, 1968, and cost $2.50 per copy. Another helpful pamphlet is the "Chemical Data Guide for Bulk Shipment by Water," CG-388, and it costs $1.25 per copy. These sales publications may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.

The "Fire Fighting Manual for Tank Vessels" replaces the prior edition of April 1, 1958. This Manual was prepared jointly by the American Petroleum Institute and the U.S. Coast Guard. The Group on Fire Protection, Safety, and Lifesaving of the American Petroleum Institute's Committee on Tank Vessels has rendered a valuable service to all tank vessel personnel in assisting in the preparation of this publication. It was compiled from carefully evaluated reports and practices, which cover actual shipboard use of fire-fighting apparatus.

Comments are invited from users of this Manual.

INTRODUCTION

This Manual has been prepared for the purpose of familiarizing seagoing personnel with the nature of fire and fire-fighting equipment and methods with which this hazard can most effectively be controlled.

The fires that never start are the ones that do no damage and kill no people. The job of keeping fires from starting is one job that should be the business of each and every man on all ships. Cleanliness and carefulness is a team which can prevent most fires. When you see any condition which could cause a fire, report it at once. Remember that the fire you prevent may save your life.

A fire, regardless of size, location or time, demands immediate action. All seamen, through their study of this Manual and their training, should be prepared for a fire emergency and know what immediate action should be taken if a fire occurs.

Speed is the most important item because in most cases the longer a fire burns the "hotter" it gets. If you can keep a fire from spreading or "get it under control," you are keeping it from getting "hotter." Getting a fire under control may be done by moving other things that will burn away from the fire, but this is not always possible. The next best thing would be to keep these things from catching fire. To do this you must remember that a flame or spark is not always necessary to start something burning. It may get hot enough to burn because it is too close to the fire or because it is against a bulkhead that is heated by the fire or by hot air or other gases given off by the fire. If you do not take these things into account, you may have two or three fires to fight instead of one. When any fire is under control, it is much easier and simpler to cool it or smother it and thereby put it out.

Fire fighting anywhere and any time is a highly specialized job, and for this reason it is necessary for the person who is to fight the fire to know his job. A general knowledge of the theory of combustion and the hazards and precautions involved in the safe handling of petroleum products will enable seagoing personnel to more intelligently make use of the equipment required in the technique of fire fighting. Water, foam, carbon dioxide (CO_2), dry chemicals and steam are conveyed to the fire scene where they are converted by the equipment described in this Manual into the most convenient form for efficient use in extinguishing fires. Without such equipment and a knowledge of its proper application in an emergency, the extinguishing agent is likely to be ineffective.

It is essential for the safety of "all hands" and the vessel itself, that all fire-fighting equipment be properly maintained and kept in its proper place, clean and in first-class condition ready for instant use. After being used, either for drill or for actual fire fighting, equipment should be inspected, reconditioned or renewed, if necessary, and returned to its designated location.

Inspection of fire-fighting equipment at regular intervals is a basic requirement for proper maintenance. An appropriate time for this inspection would be at the time of weekly fire and lifeboat drills. Furthermore, consciousness of the condition and maintenance of fire-fighting equipment should be a constant concern to all in the normal course of duty. The absence of proper maintenance is equivalent to no protection.

It is also important for a fire fighter to protect himself if he is to do a good job. It is common knowledge that fire will burn you, but there are other factors that must be thought of. A fire in a closed or unventilated compartment may have used up so much of the oxygen from the air that you could not live by breathing it. If this is thought to be the case, no one should enter without wearing suitable breathing apparatus. You can snuff out a life as well as a fire by cutting off the supply of oxygen. Also, an explosion may occur if air is admitted suddenly into a closed compartment in which there is a fire. The firefighter must BE CAREFUL—He Must Think as He Works.

All possible assistance should be given the United States Coast Guard inspectors when carrying out inspections of fire-fighting equipment and all tests should be conducted in a spirit of cooperation.

A plan of action should be formulated in advance. If fire strikes, act quickly! Lives depend on proper action being taken instantly.

Avoid recklessly abandoning a burning vessel. More lives have been lost by premature boat launchings and men going over the side in panic than have ever been lost on deck.

Fight the fire always, if only as a rear guard action. It will increase the chances of survival.

Chapter 1

THE CHEMISTRY OF FIRE AND FIRE FIGHTING

Section 1. THEORY

1–1–1. Elements of Fire

The phenomena of fire are so complex that they cannot be adequately represented by any simple diagram. Basically it consists of four components: fuel, heat, oxygen, and chain reaction.

When the temperature of a substance is raised to its 'ignition temperature' in the presence of oxygen, certain chemical reactions take place. Gases are generated and released. These gases go through a series of intermediate stages called chain reactions which result in heat and flames. To the observer, flame, smoke, and, if he is close enough to the fire, heat, which have been generated by the chain reactions, are apparent. These physical reactions have been matters of common knowledge ever since man learned how to make fire. It remained for scientific inquiry to reveal exactly what takes place in fire.

The control and extinguishment of ordinary fires in general is brought about by eliminating any one of the components. If oxygen (air) can be diluted or smothered out, the flame will go out. If heat can be taken away by cooling the fuel to a temperature below that at which it will take fire, then the fire can no longer exist. If the chain reaction can be interrupted, flame and heat cannot be formed; therefore, there will be no fire. For the purposes of this manual, it is assumed aboard ship that, except in rare cases, it will be impossible to remove the fuel from the heat and the oxygen in order to put the fire out. Therefore, the task of the fire fighter will be to reduce the temperature (to cool the fire), to isolate the fire from its supply of oxygen (to smother the fire), or to interrupt the chain reaction, and to accomplish these with the greatest possible speed.

1–1–2. Removal of Fuel

When dealing with the removal of the fuel, the fire fighter on board ship must take whatever measures possible to prevent additional fuel from coming into contact with the fire since he cannot in most cases entirely separate the combustibles from the fire. Fire fighters must be ready at all times to shift combustibles to safe areas.

1–1–3. Removal of Heat

Another method of extinguishing fire is to deal with the second component—heat. As will be explained later, heat may be transmitted in three ways, by radiation, by conduction, and by convection. Obviously, the removal of heat is best carried out by the use of water and water sprays. Also by ventilating to outside areas except in compartments where it is possible to close off openings and thus smother the fire.

1–1–4. Control of Air (Oxygen)

The third component of fire, air, is difficult to control. In most cases it is practically impossible to remove air from the atmosphere surrounding the fire. However, it can be diluted with other gases which are noncombustible, such as carbon dioxide, or excluded (smothered) with foam, so that extinguishment of the fire will occur.

1–1–5. Combustion Inhibitors

Although the actions of certain extinguishing dusts, powders, or finely divided dry chemicals are not fully understood, sufficient work has been done to indicate that the vapors from burning substances progress through a chain of chemical reactions and the introduction of an inhibiting powder is able to break the progress from link to link of the chain so that the chemical reactions culminating in the flame stop and the fire ceases to burn.

1–1–6. Ignition Temperature

The "ignition temperature" of a substance is the lowest temperature at which its vapor, usually a gas generated through the application of heat, will ig-

389-118 O - 70 -3

nite independently of any external source of ignition. A substance or its vapor, however, does not have to be heated to its "ignition temperature" throughout in order that it may be ignited with an external source of ignition.

Petroleum oils ignite, without any external source of ignition at 490° F. to 765° F., which is several hundred degrees higher than their "flash points"; butter and cooking greases ignite at 650° F. to 750° F. and "flash" at lower temperatures; wood ignites at 450° F. to 520° F. Each substance has different "fire" and "flash points," neither of which has any relationship to the other. The fire fighter, fortunately, does not have to memorize these temperatures, but a general knowledge of them serves as a constant reminder that combustibles in the vicinity of a fire have, in comparison with the heat of the fire, relatively low "ignition temperatures" and that in consequence there is an ever-present danger that fire will spread to them.

1-1-7. Fire Point

The "fire point" is the lowest temperature at which a substance will give off vapors which when ignited will continue to burn. The "fire point" is generally slightly above the "flash point."

1-1-8. Flash Point

The "flash point" is the lowest temperature at which a substance will give off enough vapors to form flammable mixture of vapors and air (oxygen) immediately above its surface. The temperature at which this mixture will "flash" across the surface (but not burn) if a source of ignition is applied, is the "flash point."

In the case of the "flash point," the temperature is not high enough to increase the rate of "vaporization" to the point where it will generate a constant supply of fuel.

1-1-9. Vaporization

The rate of "vaporization" depends on the vapor pressure, which increases with the temperature. A flammable substance is, therefore, more hazardous at an elevated temperature than at normal temperature. It is pointed out that the solid or liquid substances do not burn; only the vapor which has combined with the oxygen in the air burns. The oxygen must be present to unite with the vapor in flame. Without oxygen the flame will smother.

The tendency of a liquid to vaporize is indicated by its "flash point" and "fire point." The heat of a fire once started naturally increases the temperature of the liquid up to its boiling point. At this point the fire may no longer increase greatly in intensity because the heat supplied to the liquid by radiation from the fire approaches a maximum value which is balanced by the heat used up in vaporizing or boiling the liquid. When a liquid is burning, its exposed surface is at, or above, the temperature corresponding to its "fire point." If the burning liquid can be cooled below this temperature, the rate of "vaporization" will not provide sufficient fuel (vapor) to support continuous combustion.

1-1-10. Explosive Range

The temperature at which a flammable substance begins to burn is not necessarily the point at which it will explode. Although heat is a factor in causing explosions, the concentration of certain explosive gases in air within a container or enclosure is a determining cause of the explosion. In the case of gasoline, a vapor-air (oxygen) mixture containing more than 6 percent vapor is too "rich" to explode, and a mixture of less than 1.4 percent is too "lean" to explode. The range from 1.4 to 6 percent is the "explosive range" for gasoline. Concentrations "below" or "above" this range are said to be either "too lean" or "too rich" to explode. The concentration varies among explosive gases and it varies for the same gas under different conditions.

1-1-11. Spontaneous Ignition or Combustion

When heat is generated by chemical action within a substance and the process continues to a point of ignition, the phenomenon is known as "spontaneous ignition" or "spontaneous combustion." Usually, spontaneous heating begins with a slow oxidation which generates heat. As the heat increases the chemical action takes place at a progressively increasing rate until the "ignition temperature" is reached. Some substances reach the "ignition temperature" rapidly; other substances

0375

may take hours or days or even months; while other substances are not subject to "spontaneous combustion." Substances subject to "spontaneous combustion" will differ in the degree of probability with which it will occur, but every such substance has a point in the scale of temperatures at which it will begin to burn. Oils that combine readily with the oxygen in the air are subject to spontaneous heating.

When such oils (chiefly of animal or vegetable origin) are present in waste, rubbish or other material, under conditions in which heat is produced faster than it is dissipated, the temperature rises and ignition may occur.

1–1–12. Radiation—Conduction—Convection

Fire is spread or extended to wider boundaries or adjacent areas by one or more of the three (3) physical phenomena by which heat is transmitted, namely—RADIATION, CONDUCTION OR CONVECTION.

Through radiation heat is sent forth in direct rays, equally in all directions. Decks and bulkheads are heated by radiation. The heat passes through them by conduction to ignite combustibles on the opposite side of these partitions, either directly by conduction, or by radiation or convection.

In conduction, heat is transmitted through solids, liquids, and gases and is the process in which the molecules of a substance are heated by molecules having a higher temperature with which they are in contact. Conduction of heat does not proceed with equal facility in all substances. Some substances conduct heat more readily than others. Substances with a very high "ignition temperature" will serve simply as conductors and will remain unaffected. Steel bulkheads, decks, pipes, and similar structural members may serve in this way as conductors of heat to dangerous combustibles.

In convection, portions of gases and liquids that are heated to a higher temperature than the rest of their mass become lighter in weight and move upward into the cooler portions above. It is by convection that heated air and other heated gases rise over a fire and are carried by the wind to ignite combustibles at some distance away. This process is particularly applicable to ventilation systems aboard ships which may carry the heated gases to places far removed from the fire.

Section 2. CLASS OF FIRES

1–2–1. Types of Fires

Fire may be classified in three groups; namely,

Class A: Fires in ordinary combustible materials, such as mattresses, dunnage, piles of wood and shavings, canvas, etc. These fires are best extinguished by the quenching and cooling effects of quantities of water or water fog.

Class B: Fires in substances such as gasoline, oil, lubricating oil, Diesel oil, tar, greases, etc. Here the blanketing or smothering effect of the extinguishing agent is of primary importance.

Class C: Fires in live electrical equipment, such as switchboard insulation, transformer terminals, etc. Here the extinguishing agents *must be nonconducting* so that electrical shock is not experienced by the fire fighter.

Class D: Fires in combustible metals such as magnesium, sodium, titanium, lithium, etc.

2762

Chapter 2

CHARACTERISTICS OF CARGO

Section 1. CARGO CLASSIFICATION

2–1–1. Types of Liquid Cargo

Liquid cargoes, which are at the present time carried in bulk on tank vessels, are not only petroleum products, but several other kinds of flammable or combustible liquids, certain mixtures of flammable liquefied gases, flammable or combustible liquids having lethal characteristics and many nonflammable liquid chemicals such as chloroform, caustic soda, ethylene perchloride, etc. The great majority of liquid cargoes transported on tank vessels are oils which in general may be divided into petroleum base, coal base, vegetable oil, marine animal and fish oil and animal oil. Oils produced from crude petroleum are by far the most important because of the tremendous quantities which are being carried. With proper equipment, reasonable diligence and adequate knowledge, this kind of cargo in bulk or package may be handled safely and with remarkable freedom from fire and/or explosion.

The rapid development of the petroleum industry has created a demand for water transportation of many new materials which may have other properties. The probability of a vessel carrying one of these may be remote, but if any of these materials are to be carried, the vessel will be fully advised of any special hazards and necessary precautions.

2–1–2. Classification of Oils

For the purpose of regulating tank vessels, the regulations of the U.S. Coast Guard divide petroleum products into flammable liquids, combustible liquids and flammable liquefied gases.

Flammable liquids are liquids which will give off flammable vapors at or below 80° F., or the liquids will flash in contact with flame when its temperature is at or below 80° F. Flammable liquids are divided into three grades as follows:

Grade A.—Any flammable liquid having a Reid vapor pressure of 14 pounds or more.

(The Reid method of measuring vapor pressure consists of placing a small amount of liquid into container with pressure gauge, and after closing tight, heating liquid to a temperature of 100° F. and measuring the vapor pressure, which is expressed in pounds per square inch absolute.)

This group includes: casinghead, natural gasoline, very light naphtha, butane blend gasoline, etc.

Grade B.—Any flammable liquid having a Reid vapor pressure under 14 pounds and over 8½ pounds. This group includes most motor gasolines.

Grade C.—Any flammable liquids having a Reid vapor pressure of 8½ pounds or less and a flash point of 80° F. or below. This group includes most of crude oils, "cut back" asphalt, creosote, benzol, toluol, alcohol, aviation gasoline, some jet fuel, etc.

Combustible liquids are liquids which will give off flammable vapors only above 80° F. or liquids having a flash point above 80° F. Combustible liquids are divided into two grades as follows:

Grade D.—Any combustible liquid having a flash point below 150° F. and above 80° F. This group includes: Kerosene, light fuel oils, few very heavy crude oils, some jet fuel, etc.

Grade E.—Any combustible liquid having a flash point of 150° F. or above. This group includes: heavy fuel oils, "Bunker C," Diesel fuel, road oil, lubricating oil, asphalt, coal tar and fish, animal and vegetable oils.

Flammable Liquefied Gas.—Means gas having a Reid vapor pressure exceeding 40 pounds which has been compressed and liquefied.

2763

Chapter 3

FIRE–FIGHTING AGENTS AND EQUIPMENT

Section 1. FIRE MAIN SYSTEM

3–1–1. General

The fire main system aboard tankers is a system of permanent piping which receives water pumped from the sea and delivers it to fire hydrants strategically located throughout the vessel. Any part of the living quarters, weather decks, machinery spaces, stores and working spaces, and any part of cargo decks accessible to the crew at sea must be able to be reached with two (2) streams of water, one of which is from a single 50-foot length of hose.

All portions of the main machinery spaces shall be capable of being reached by at least two effective spray patterns of water each from a single 50′ length of hose from different outlets.

Each and every seaman aboard ship is a fire fighter when the emergency arises. Therefore, each seaman should have a working knowledge of the fire main piping system, its master control and cutout valves and fire hydrant outlets. Each fire drill should serve the dual purpose of not only instruction in the proper and effective use of fire fighting agents and equipment, but also the procedures for localizing and offsetting the effects of damage to the fire main system.

3–1–2. Types of Fire Mains

Most fire main systems installed on tankers are one of two types: the single main or the horizontal loop system. The single main system consists of a single main extending fore and aft above the main deck. This main is led near the center line of the vessel and extends as far forward or aft as necessary to supply the various services. The horizontal loop system consists of two cross-connected mains extending fore and aft above the main deck. At their extremities the two mains are connected to form a loop. The advantage of the horizontal loop system is its versatility of use in any emergency.

Fire main piping is usually 5 or 6 inches in diameter with branch lines of smaller diameter leading off to fire hydrants of 2½-inch or 1½-inch diameter.

3–1–3. Fire Hydrants

Each fire hydrant is equipped with a valve so that the fire hose may be removed while there is pressure on the fire main. Fire hose must be connected to the hydrant at all times except on open decks where the location of the fire hydrants is such that no protection is afforded for the hose in heavy weather. One other exception when hose may be temporarily disconnected from the hydrants is where such connection interferes with cargo handling.

When the fire hydrant is unprotected by the hose being disconnected, it is advisable to use protective screw caps and a thin coating of light grease on the threads of the hydrant outlet.

3–1–4. Fire Main Piping

The fire main system is part of the vessel's permanent piping system and should be maintained in the same manner as other deck piping. Should it appear that any part or parts of the piping has deteriorated to the extent that there is any likelihood of its not being strong enough to withstand the working pressure, such part should be replaced.

The interior of the fire main piping is likely to collect rust and incrustation. The best way to reduce this condition is to flush out the entire system regularly by holding fire drills at different locations each week. It is suggested that once every 5 to 7 drills the fire hydrants below decks be flushed out at maximum pressure. Fresh water flushing will destroy any marine growth and this fact should be taken advantage of whenever possible.

Inside station

Outside station

Figure 1.—Fire hydrants.

3-1-5. Quick Cleaning Strainer

Unless a quick cleaning strainer is contained within the nozzle itself, a self-cleaning strainer shall be attached to the fire hydrant directly or by means of a short length of hose. These strainers trap foreign substances such as rust and other particles that accumulate in the fire main. Without the strainer, the foreign matter clogs the small orifices in the applicator heads and reduces their capacity to make fog, except where high and low velocity spray heads have large orifice openings.

3-1-6. Fire Hose

Fire hose in use aboard tanker vessels is usually of two types, single or double cotton jacketed rubber lined or synthetic rubber covered with rubber lining and is Underwriters' Laboratories Inc., labeled or equivalent. Fire hose (for tankers) usually comes in 50-foot lengths of two diameter sizes, 1½-inch and 2½-inch. Generally fire hoses on the weather decks are long enough to be goose-necked over the side.

The 2½-inch hose is usually used on weather decks on large vessels. It has been demonstrated that 1½-inch hose is much easier to handle.

Fire hose couplings are of bronze, brass, or other equivalent metal having male and female threads. When 1½-inch hose is used on 2½-inch fire hydrants, it is necessary to attach reducing connections, using the single (straight type) or double (Wyegate) type outlets.

Fire hose should be kept in clean condition. Washing the hose is not recommended except when

Figure 2.—Self-cleaning strainer (half section).

Figure 3.—Faking fire hose at inside station.

the cotton cover becomes oily or greasy. Oil or grease should be washed off the hose with fresh water, using a soft-bristled brush and a mild soap. Wire brushes, holystones, sand or strong caustic soap should not be used. After washing or using hose, it should be thoroughly drained and dried at ordinary temperatures before restowing. Hose should never be dried at high temperatures as this tends to harden the rubber lining.

Fire hose should never be painted nor should paint, grease or oil be applied to the couplings. The swivel on the female coupling should be kept free turning and shall always have a gasket or washer inserted. To lubricate the swivel or to remove corrosion a stiff bristled brush with fresh water and soap should be used. The couplings, thread and gasket should be kept in good condition so that the hose may be coupled tight enough by hand to make a water tight connection. This is an advantage and a precaution as it may be necessary to uncouple the hose in an emergency.

Couplings are made of soft alloy metals and are easily damaged by iron tools, dropping or careless handling. For this reason hose couplings should never be allowed to drag over the deck except when necessary in an emergency.

Fire hose may be stowed in either of two ways, depending on the type of hose and the bracket or rack provided. Synthetic rubber hose is usually rolled and stowed on reels. Cotton hose can be rolled or faked according to the rack design. Whether the hose is faked, rolled, reeled, etc., it should be stored in a manner which will allow the nozzle end to be run out to the fire, leaving the female end attached to the fire hydrant outlet.

Fire hose should not remain faked, rolled or reeled for too long a period. When re-faked or re-rolled, the hose should not be doubled or bent in the same bight as before so that the rubber liner will not become "formed." The bottom of the roll or fold should be at least 6 inches above the deck to avoid exposure to swabbing, seawater or painting. Hose should be inspected each time it is run out. When water seepage shows through the jacket or at the couplings, cuts, cracks or abrasions or shows other obvious defects, such hose should be set aside and replaced with a spare.

3–1–7. Pressure Loss Due to Friction

The lateral pressure of water on the walls of fire hose (and fire main piping) causes friction which reduces the pressure between the fire main pumps and the hose nozzles. The fire fighter should understand what happens when he connects additional hose, or reduces a single line to two smaller lines, or makes other adjustments. He will know, for example, that a fire main pressure of 100 p.s.i. delivers only 83 p.s.i. to a 1-inch nozzle outlet at the end of 2 lengths (100 feet) of 2½-inch hose; and delivers only 70 p.s.i. to a ⅝-inch nozzle outlet at the end of 2 lengths (100 feet) of 1½-inch hose. Knowing this, he should be able to lay out his hose lines intelligently. A few properly charged hose lines are more effective than many undercharged hose lines.

3–1–8. Fire Hose Attachments

The straight and Y-gate reducers, the plain and "all-purpose" nozzles, the low-velocity "applicators" and hose spanners when not in use, should be kept in the clips or racks provided and their valves, threads, joints and unpainted surfaces kept free of corrosion. The high-velocity nozzle tip should always be attached to the "all-purpose" nozzle by the chain and snapped in the fog outlet on the nozzle.

2766

Typical stowage

Proper rolling

Figure 4.—Fire hose.

The bayonet joint in the "all-purpose" nozzle, the nozzle tip, joint end and the head of the "applicator" should be coated with a light grease. Heavy grease or grease that congeals should not be used for this purpose. The joint end and the head of the "applicator" should be suitably protected by a canvas sock or other means when not in use. The "applicators" should not be left attached to the "all-purpose" nozzles when racked. The outlets (holes) in the "applicator" head must be kept free of corrosion, hard grease or any other obstruction that might impede the free flow of the water stream. Hose spanners are usually galvanized or made of some other rust resistant metal.

3–1–9. Nozzles and Applicators

There are two types of bronze nozzles currently in use, the funnel shaped plain or common type, which emits a solid stream, and the "all-purpose" or "combination" type, which emits either a solid stream or high-velocity fog. Both types come in 1½-inch and 2½-inch sizes.

The plain or common type nozzle has been in use for many years. It is used chiefly in fighting "class A" fires, for cooling decks and bulkheads and for diverting the flow of oil. For safe operation three men are necessary to control the 2½-inch straight or all-purpose type nozzle during operation when the pressure on the hose is approximately 100 p.s.i. Under the same conditions two men are necessary on 1½-inch hose. In either case the nozzle men should be backed up by enough additional men to spell them at the nozzle and assist in handling the hose.

3–1–10. "All-Purpose" or "Combination" Nozzle

The "all-purpose" or "combination" nozzle has two outlets and a single valve. To operate the nozzle, the valve handle is pulled back from the shut position (forward), to the fog position (vertical), to the open or solid stream position (back) and vice versa. The use of the nozzle is flexible. The fire fighter can turn on the fog and turn it off, or he can turn on the fog and then the solid stream, and then by passing the handle through the fog position, shut the valve.

Caution should be exercised by the men at the nozzle when switching from "off" to "solid stream" and from "fog" to "solid stream" positions. Considerable thrust is exerted by the change in pressure when switching positions at the nozzle, which causes the nozzle to slip.

Figure 5.—"All-purpose" nozzle showing three handle positions.

Figure 6.—High velocity fog.

3–1–11. High- and Low-Velocity Tips and Applicators

When high-velocity fog is desired, the high-velocity bronze nozzle tip, attached by a short chain, shall be left in place in the fog outlet on the "all-purpose" nozzle. When low-velocity fog is desired, the high-velocity nozzle tip is removed and an "applicator" equipped with a low-velocity head is snapped into place in the fog outlet of the "all-purpose" nozzle. A bayonet joint holds the "applicator" in the all-purpose nozzle. Control of this velocity is desirable as for some fire-fighting tasks a low-velocity fog is preferable and for others, a high-velocity fog.

For both the high-velocity nozzle tip and the low-velocity "applicator" head, the water pressure is the same, since pressure is not the differentiating factor in the velocity achieved by the two. For the best results with either, the water pressure at the nozzle should be maintained as close to 100 p.s.i. as possible and no lower than 60 p.s.i.

The fog stream is projected more than 20 feet from the 1½-inch nozzle with the high-velocity tip and more than 35 feet from the 2½-inch nozzle with the high-velocity tip.

When using the low velocity "applicator" head, the water stream is broken down into finer particles. The water particles (fog) do not have force for more than a few feet from the fog head; therefore, a suitable "applicator" length must be used (*See Figure 8*). The applicator enables the fire fighter to reach over or around obstructions in order to place a cooling, smothering blanket of fog on the fire.

Applicators come in lengths from 4 to 12 feet and in diameters from ¾ to 1½ inches with 60° or 90° curves at the outlet end (*See Figure 8*). Usually ¾- and 1-inch diameter applicators are used in 1½-inch all-purpose nozzles and 1½-inch diameter applicators in 2½-inch nozzles. The fog head is screwed into the outlet end of the applicator, the applicator in turn snaps into the bayonet joint in the fog outlet on the all-purpose nozzle (*See Figure 9*).

The all-purpose nozzle when equipped with the applicator and low-velocity fog head projects a fog having the maximum diffusion; therefore, one that presents the maximum total surface for the absorption of heat. The fog pattern from the fog head is at its most effective dimensions 5 or 6 feet from the outlet tip of the applicator. The high-velocity nozzle tip on the 1½-inch "all-purpose" nozzle sends a stream of fog several times this distance and on the 2½-inch nozzle 5 or 6 times this distance. High-velocity fog has a lower degree of diffusion, but it provides force and range. Whether from a low-velocity head or a high-velocity tip, the fog extinguishes fire by absorbing heat and by reducing the supply of oxygen through infiltration above the fire.

Figure 7.—Applicators.

389-118 O - 70 - 4

Figure 8.—Inserting low-velocity applicator into "all-purpose" nozzle, high-velocity nozzle tip removed.

When the valve of the 1½-inch or 2½-inch "all-purpose" nozzle is moved into the open or solid stream position, the nozzle of the 1½-inch size releases a solid stream of water through an outlet ⅝-inches in diameter and the nozzle of the 2½-inch size through an outlet 1 inch in diameter. At 100 p.s.i. at the fire hydrant either size nozzle will project a solid stream of water a distance of about 75 feet.

Section 2. WATER

3–2–1. Cooling

The use of water as a cooling agent is the most common method of fighting fires. Water as a cooling agent is far superior to all others, is usually available in ample quantities and is inexpensive. Therefore, the cooling of fire with water is a universal practice. Water (particularly in the form of fog) has the greatest capacity for heat absorption of all the extinguishing agents presently in use. It may be applied to a fire directly by hand, with buckets, or delivered to the fire by pipe and hose.

3–2–2. Water Fog Or Spray

The cooling ability of water is tremendously increased when it has been converted into fog by the use of the "all-purpose" nozzle. These nozzles diffuse each gallon of water into millions of particles. As a result, the vastly increased total surface for the absorption of heat makes fog an extremely efficient cooling agent. Besides its capacity for cooling fire, fog also dilutes combustible vapors. When fog is turned to steam by the heat of the fire, it forces air away from the fire, thereby removing the oxygen needed to support combustion.

Fog can be used successfully on oil fires to knock down the flames and act as a barrier against radiant heat from hot bulkheads and other metal structures. Also, it is a more desirable agent than a solid stream of water in situations where water damage must be held to a minimum. Fog also protects the fire fighter by the screen it forms between him and the fire. This screen shields him from the intense heat so that he can approach close or stand away as conditions require.

To a certain extent fog also washes fumes and smoke from the atmosphere, which gives additional protection to the fire fighter.

Even though it may be advisable to extinguish a fire by means of foam or CO_2, the use of a low-velocity fog spray between the fire fighters and the blaze will enable them to approach more closely, thus adding to the effectiveness of the actual extinguishing agent.

Figure 9.—High-velocity water fog, operating the 2½-inch "all-purpose" nozzle (handle vertical).

3–2–3. Application of Water

The technique employed in fighting a fire with water is a matter of using common sense. In order to place the water stream or fog where it will do the most good, the fire fighter must approach the fire protected from the heat, fumes, and smoke generated. For this reason, the nozzle men should bend forward as they approach a fire, keeping their faces as close as practicable to the deck where the heat is somewhat less intense. The rushing stream has a cooling effect and creates a void into which fresh air is drawn.

Figure 10.—Low-velocity water fog operating the 2½-inch "all purpose" nozzle with 12-foot low-velocity fog applicator (handle vertical).

To beat back the heat, fumes and smoke of the fire, water fog should be brought into play to protect the fire fighters by forming a barrier between them and the fire. This allows them to move forward and approach the seat of the fire. The fire fighter must remember to *keep the fog between himself and the fire.*

No hard and fast rule can be set on whether to use high- or low-velocity water fog to protect the fire fighters. If the fire is approached from windward and the fuel is less volatile than gasoline, low-velocity is recommended. If it is necessary to approach the fire from leeward or if the fuel is as volatile as gasoline or greater, high-velocity is recommended. These recommendations are based on the fact that high-velocity water fog has greater directional force and would tend to deflect the flame, heat, and gases away from the fire fighters. The "all-purpose" nozzle permits the use of a solid stream or a high-velocity fog at intervals, changing from one to the other as conditions warrant. The solid stream is most efficient for getting at the seat of "class A" fires while the surrounding area is protected by using high or low-velocity fog as a cooling medium. Such cooling will remove or reduce

the danger of heat passing through adjacent decks and bulkheads by conduction, thus igniting combustibles in adjoining compartments.

3–2–4. Water Spray Systems

The fixed spray system consists of fixed piping within the space protected, which usually takes its water supply off the main fire line. The branch lines within the space protected are fitted with water fog heads so arranged as to provide a uniform distribution of water spray over the entire area of the space to be protected.

The control valve (only one is installed) for the system is of the deluge type and is accessible from outside the space protected. Drains, strainers and dirt traps are fitted wherever necessary to prevent the accumulation of dirt or moisture.

The pump supplying water for the system may be either reserved exclusively for the system or it may be one of the fire pumps. The amount and pressure of the water required for any particular system depends directly on the type and number of water spray heads in the system and the pressure drop in the supply piping.

Section 3.—FOAM

3–3–1. General

Foam is one of the most effective agents for extinguishing "class B" fires (oil, grease, paint, etc.) and to some extent "class A" fires (woodwork, bedding, clothes, stores, etc.). Disadvantages: it *will* conduct electricity, is not always effective on flowing liquids and it is not effective at extremely low temperatures (under 10° F.).

Foam for fire-extinguishing purposes on board tank vessels is of two types, chemical and mechanical. The characteristic difference in the equipment for producing the two kinds of foam is that the nozzle used for mechanical foam adds air to the chemical bearing stream after the chemicals have been dissolved in it. The equipment for chemical foam does not add air to the chemical-bearing stream.

Although classified as chemical foam and mechanical foam, both are made with chemicals and at the time of the fire, mechanical foam, more recently developed than chemical, has qualities that

Figure 11.

derive from the mechanical effects of the entrainment of air at the nozzle. It is produced with a foam-chemical solution. Chemical foam is produced with dry chemicals (except in the two-solution tank system). Both kinds have individual advantages and both have limitations.

3–3–2. Chemical Foam

The chemical-foam blanket is composed of water film globules filled with carbon dioxide. It is the result of a chemical reaction of bicarbonate of soda, aluminum sulfate (or ferric sulfate), and a "foam stabilizer." It has more body than mechanical foam and consequently builds up a stouter cover over a fire. Since it will pile up against and cling to vertical structures, it will reach and cover, on occasions, combustibles burning a foot or two above the deck. It will not, however, pass freely around obstructions.

Figure 12.

Figure 13.—Chemical foam hopper.

3–3–3. Producing Chemical Foam

A continuous-type generator (figure 19, fixed or portable) is used in the production of chemical foam. It consists of a hopper having a so-called "ejector" inside the bottom, which serves as a means of dissolving dry-foam chemicals in the stream of water. After the water (at 75 to 100 p.s.i. pressure) has been started through the generator, the dry chemical mixture is poured into the hopper. Where the powders are stored in the hopper, chemical control valve levers are opened to release both chemical powders to the ejector. The chemicals are drawn into the water stream as it rushes past the ejector gap into the fire main or hose line. The piping, or hose line of 100 feet for ordinary conditions, provide a channel for the chemical action necessary for effective foam production. The length of 2½-inch hose line used for discharging the foam should vary in length according to the temperature of the water but should never exceed 150 feet. The hose should have a nozzle on the outlet end 1½ inches in diameter (the diameter required for the most effective discharge).

In the large hopper type of generator the chemical foam powders are usually stored in the twin compartments of the hopper, ready for immediate use. This type is usually equipped with a mechanical turning device which should be turned occasionally to unpack and free up the powders which may settle due to the vessel's vibration. Extra chemicals are usually stored in containers holding 50 pounds each. These containers must be kept sealed and stored in a cool dry place until used. Containers should be inverted periodically. The continuous type generator is also made in a two hopper style, which is, as the name implies, one in which the dry chemicals are dissolved separately in two streams of water which are brought together at the discharge outlet to produce foam.

In the twin solution type of foam generator, bicarbonate of soda and foam chemicals are held in solution in one cylinder and aluminum sulfate is held in solution in the other. The contents of the two cylinders are pumped separately to discharge outlets in which the solutions mix to produce and discharge foam on the area being protected.

Referring back to the continuous-type generator, the rate of consumption of foam powder is approximately 100 pounds per minute with either fresh or salt water at 70° F. Since each pound of foam powder produces about 8 gallons of foam, the foam produced per minute is 800 gallons. Seven and a half gallons of the chemical foam are equivalent to 1 cubic foot in bulk. The production per minute in bulk, therefore, is 106 cubic feet. For an application 3 inches thick per minute, 106 cubic feet per minute provides coverage for 400 square feet of surface or a surface area measuring 20 x 20 feet.

Instructing personnel during fire drill in the quick and most efficient use of this equipment will avoid costly mistakes at time of fire.

3–3–4. Mechanical Foam

Mechanical foam when applied to a surface makes a blanket of closely-knit, tiny, air-filled bubbles that readily floats on the lightest flammable liquids thus cutting off the air supply and smothering the fire. Foam acts in such a way as to extinguish the fire progressively. It is not easily dissipated. It flows readily across the burning liquid and forms a tight, smothering blanket which remains intact after extinguishment to prevent re-ignition.

3–3–5. Concentrated Foam Liquid

Foam liquid used to make mechanical foam is a concentrated aqueous solution and when mixed with water at the rate of 6 parts liquid to 94 parts water, (3 parts to 97 parts water in the case of 3% liquid) the amount of foam produced will be ap-

2772

proximately 10 times the amount of solution used. Foam liquid should be protected from a temperature below 20° F. and above 100° F. If the liquid is frozen, however, it can be thawed out again with no harmful effects. Special foam liquids are available where extreme cold temperatures are a problem. They maintain their mobility and are ready for use at temperatures down to −20° F.

There are certain flammable liquids which destroy regular foam. These include among others amines, ethers, alcohols, esters, aldehydes, and ketones. Recently a new foam has been developed which is effective on these liquids and which can be used with little change to existing foam installations.

3–3–6. Producing Mechanical Foam

Mechanical foam is produced by bringing together in a turbulent state three ingredients: water, concentrated foam liquid and air. When these three ingredients are thoroughly mixed, foam is produced.

The three basic component parts of a foam system are the "Proportioner", the "Foam Maker", and the "Discharge Outlet". The Proportioner introduces concentrated foam liquid into the water discharge from the fire pump in the ratio of approximately 6 parts liquid to 94 parts water for a 6% system, and 3 parts concentrated liquid to 97 parts water for a 3% system. This solution under pressure then flows to the Foam Maker. Solution flowing at high velocity through the foam maker aspirates air in the proper proportion. The three ingredients are thus mixed in a turbulent state downstream of the foam maker to create foam which is applied to the protected area through the discharge outlets. The foam maker itself can sometimes perform the function of both the proportioner and the foam maker by drawing into the water stream both concentrated foam liquid and air. In the majority of cases, however, these devices will be separate.

In general, foam protection on vessels falls into three categories: 1. Fixed piped-in protection for boiler rooms, machinery spaces, and pump rooms; 2. Deck foam system for cargo tank area; 3. Portable first aid or supplementary protection. (See sketch of each type).

3–3–7. Fixed Foam Systems

Fixed foam protection for Boiler Rooms, Machinery Spaces, and Pump Rooms require a fixed (completely piped) system which floods the protected area (s) at a minimum solution rate 1.6 gpm per 10 sq. ft. for at least 3 minutes.

The approved foam discharge devices for these areas are the Marine Floor Nozzle and the Overhead Spray Deflector. Usually the floor nozzle is found in the boiler room and machinery spaces, and the overhead spray deflector in pump rooms.

Figure 14. Monitor Nozzle.

2773

Figure 15.—Mechanical foam nozzle with pickup tube.

Although either device (or combination of both) can be used in any of these locations.

In most cases the foam liquid proportioning will be done from a central location by either a Pressure Proportioner, a Positive Displacement (Water Motor) Proportioner, or a Balanced Pressure Proportioner.

3–3–8. Deck Foam Cargo Tank Protection

On tank vessels, foam protection for cargo tanks includes a centrally located proportioner (or proportioners), a fixed foam solution main, and sufficient monitors and/or foam hydrants connected to the main for operation of monitor mounted or portable nozzles at a minimum solution rate of .016 gpm per sq. ft. of total cargo area for at least 15 minutes without recharging. Either monitors or portable nozzles or any combination may be used to provide the requirements for flow rate, coverage, etc. (*See Figure 14*).

3–3–9. Portable First Aid or Supplementary Protection

While not necessarily required, portable foam devices in addition to the fixed systems are valuable for first aid protection and to supplement the protection provided by the fixed systems.

3–3–10. Mechanical Foam Nozzles With Pick-up Tube

The mechanical foam nozzle with pick-up tube is designed such that it entrains air through an aspirating cage in its butt end and introduces mechanical foam liquid into the water stream through a device called the pick-up tube with the resulting foam passing through the nozzle portion. One type consists of a 21-inch piece of flexible metal, or asbestos composition hose, 2 inches in diameter with a solid metal nozzle outlet and, in the butt end, a suction chamber and an air port which forms the aspirating cage. The pick-up tube consists of a

Figure 16.—Operating the mechanical foam "pick up" unit.

Figure 17.—Mechanical foam "pick up" unit and 5-gallon foam liquid containers; 2½-gallon chemical foam extinguisher in background.

short piece of ⅝-inch metal pipe with a short piece of rubber hose on one end and is used to draw up the contents of a 5-gallon container of foam liquid. These pick-up tubes are actuated by the suction created in the suction proportion chamber of the mechanical foam nozzle. To operate, the mechanical foam nozzle is screwed on the fire hose, the pick-up tube is screwed into the side port in the base of the nozzle and the metal pipe end of the pick-up tube is inserted into the concentrated foam liquid container. When water pressure is applied to the fire hose, the vacuum-syphon effect created by the water passing through the mechanical foam nozzle draws the foam liquid from the container through the pick-up tube up into the nozzle where it mixes with the air and water and is expelled in the form of mechanical foam. (*See Figures 15, 16 and 17.*)

3–3–11. Portable "In Line" Proportioner

Another method of getting foam to the fire and permitting more flexible use of the mechanical foam nozzle is the use of the portable "in-line" proportioner or "eductor." This proportioner may be installed anywhere in the fire hose lines to the windward side of and at a convenient distance from the fire, thereby permitting foam solution to be fed into the hose line while clear of the heat of the fire. The proportioner is a lightweight venturi device which uses the water stream pressure to draw the foam liquid from a 5-gallon container through the pick-up tube and induce the foam liquid in the proper proportion to the fire hose line.

If the fire is located where it would expose the fire fighter to excessive heat, the portable in line proportioner can be used. The male end of the fire hose feeding water to the proportioner is screwed into the female end (gage end) of the proportioner; the pickup tube is screwed into the top center of the proportioner. The male end of the fire fighting hose is led to the fire site and the mechanical foam nozzle is screwed on. The female end of this hose is connected up to the discharge end (male) of the proportioner. When the water pressure on the inlet side of the proportioner reaches 65 p.s.i. (shown on gage) or higher, insert the suction end of the pick-up tube into the foam solution container.

Whether using the pick-up tube directly off the mechanical foam nozzle or off the in-line proportioner, extra cans of liquid foam should be opened and kept on hand so that the pick-up tube can be quickly transferred from an empty can to a full one. Time limitations of a full 5-gallon container of liquid foam makes this precaution necessary. At

Figure 18. Portable "in-line" proportioner.

50 p.s.i. water pressure, one 5-gallon can of liquid foam will last approximately 2½ minutes; at 100 p.s.i. water pressure the same can of concentrated foam liquid will last about 1½ minutes.

3–3–12. Application of Foam

The application of foam to a fire is extremely important. In most cases, using either mechanical or chemical foam, a stream of foam should be deflected from a bulkhead or other vertical surface in such a way as to avoid undue agitation of the burning surface. The fire fighter must remember that foam is only efficient when it covers the top of burning combustibles. Therefore, he must hold the foam stream sufficiently above the deck in order to break the stream's force before it flows over the fire. Since the rate of application is important, several streams of foam should be placed in operation as soon as possible. The operation is continued until the burning area is completely covered with a foam blanket thick enough to smother the fire. No exact rule for the thickness of the foam blanket can be formulated except that the fire fighter should remember that the roll and pitch of the ship may cause breaks in a thin cover which might result in the reignition of the flammable liquid beneath.

If the fire is on deck, or is a running fire, it is most effective to play the foam stream ahead of the burning liquid and bounce it on the fire. If the liquid continues running, it can be diked with foam, which will hold it until a blanket of foam can be spread on the surface.

3–3–13. Foam Versus Water Fog

Water in the form of fog is effective on oils having a high flash point, provided the whole burning surface can be reached, or the burning surface can be "walked" or forced into a relatively small surface area. Water fog is also effective on oils having a low flash point, provided a fresh supply of air (oxygen) can be excluded.

Oil and grease burn only on the surface; therefore, the smothering effect is most advantageous for extinguishment. On such fires, foam flows over the surface and provides a tight cover, isolates the fire from its source of air and checks rekindling as might otherwise be caused by hot bulkheads or fire in the vicinity. Foam also retards the formation of vapor on the surface of the oil and thus hastens extinguishment. The cooling effect of foam on a fire, because of its water content, reduces the fire's radiant heat. Vapors cannot penetrate to reignite above the foam blanket and radiate back to the oil to give it the heat required for combustion. On occasions, a low-velocity water fog may be used in conjunction with (but not in the same spot) the foam in order to beat down the heat of the fire and permit closer approach with foam equipment. Low-velocity water fog will also lower the temperature of the burning liquid and hasten the formation of a protective foam blanket. Once formed, the foam blanket will usually remain effective for several hours, (if thick enough) and thus allow the surrounding structures to cool.

Section 4. CARBON DIOXIDE (CO_2)

3–4–1. Extinguishing Qualities

Carbon dioxide (CO_2) is an excellent smothering agent for extinguishing "class B" (oil, grease, paint, etc.) and "class C" (electrical apparatus) fires in situations where it will not be widely diffused or, if the fire is beyond the incipient stage, where it will not be blown away by drafts. It is most effective when applied where it will remain as a cover long enough to reduce the amount of oxygen in the air over the fire to a point below which combustion is not possible. The normal oxygen content of the air is 21 percent by volume. If carbon dioxide replaces the oxygen in the air to an extent sufficient to bring the oxygen content down to 15 percent or lower by volume, not enough oxygen remains in the air to support combustion. As carbon dioxide is 1½ times heavier than air, it flows down and over a fire and, if of sufficient concentration and not disturbed by air currents, it will hover long enough to extinguish the fire.

3–4–2. Rekindling Danger

It should always be borne in mind that fire extinguished by carbon dioxide may be rekindled if the carbon dioxide is in turn replaced by sufficient air to bring the oxygen content of the air above 15 percent. Rekindling by restored oxygen occurs when the temperature of the combustible has not been reduced below its ignition temperature or when this required temperature is quickly reached

again because of heat radiated from other burning substances or hot structures nearby. *It is therefore important that all openings through which air can enter be secured. This includes hatches, doors and ventilation systems.*

3–4–3. Use Around Machinery and Electricity

Carbon dioxide is an inert gas that is noncorrosive, a nonconductor of electricity, and can penetrate into voids and spaces in and around machinery. It is particularly effective in the pump room, fire room, engine room, and in such other locations where machinery is at floor plate level. It will not damage the most delicate machinery or instrument and being a nonconductor, it can be safely used in fighting fires around energized electrical equipment that would otherwise present the additional hazard of electric shock.

Carbon dioxide is equally effective at all temperatures. It does not freeze, leaves no residue, and can be quickly and easily removed by ventilation. (See: section 3–4–6 on Dangerous Qualities.)

3–4–4. Use on Oil Fires

Applied *promptly,* carbon dioxide is effective on burning oil. Its effectiveness lies in the fact that the combustion of oil occurs only at the surface. Except for a layer there, the bulk of the oil is comparatively cool in the early stages of a fire; and there is *less* danger of rekindling from hot bulkheads or other metal structures in the event the carbon dioxide should be drawn away from the surface.

3–4–5. Storage

Whether in a fixed installation or portable, carbon dioxide is stored in steel cylinders at a pressure of about 850 p.s.i at 70° F. Under this pressure, about two-thirds of the carbon dioxide is in a liquid state. When discharged, it rapidly expands to 450 times its stored volume. Due to this rapid expansion, it is immediately reduced in temperature to 110° below zero F. and the liquid is vaporized to an invisible carbon dioxide gas. Some of it, however, has the appearance of snow before it returns to the gaseous state. Due to its extremely low temperature, *the snow will blister the skin and cause painful burns* if it is not removed promptly. Even with the low temperature of the expanding carbon dioxide as it leaves the cylinder, its cooling effect on fire is slight. This is explained by the fact that the total cooling effect of the gas and "snow" released is about 100 B.t.u. per pound. This is small compared with water, which has a theoretical cooling effect of about 1,000 B.t.u. per pound, assuming that it is all evaporated into steam.

3–4–6. Dangerous Qualities

The very qualities which make carbon dioxide a valuable extinguishing agent also *make it dangerous to life.* When it replaces oxygen in the air to the extent that combustion cannot be sustained, respiration cannot be sustained either. Prolonged exposure to air laden with carbon dioxide causes suffocation, very much as immersion in water does when a person drowns. *Carbon dioxide cannot be seen nor smelled* and, therefore, gives no warning of its presence that can be recognized by the senses. Since it is heavier than air, it does not rise, but remains close to the surface in a deep or shallow pool, according to the area covered and the amount used. With a 15-pound portable carbon dioxide extinguisher there is practically no danger, inasmuch as its 135 cubic feet content in the average compartment lies in a shallow pool, well below the normal breathing level. However, the concentration of carbon dioxide released in a compartment from a fixed system would be extremely dangerous to personnel. Therefore, all compartments so served have a self-actuated alarm which automatically sounds off (gives warning) when the valve releasing the gas in the compartment is opened. When a person enters a compartment that contains, or there is reason to believe contains, carbon dioxide in a dangerous concentration, he must wear suitable breathing apparatus and be fitted with a suitable life line, tended by another person outside the compartment, under the supervision of a licensed officer.

3–4–7. Portable, Semiportable or Fixed Equipment

Carbon dioxide fire-fighting equipment is either portable, semiportable or fixed. The majority of vessels are equipped with the portable, so-called "15-pound" type and the "50-, 75-, or 100-pound" cylinders are referred to as the fixed type or as semiportable if fitted with a hose on a rack or reel which permits application to any point in the space

Figure 19a.—Disc type.

protected. The size (pounds) of carbon dioxide cylinders represents the weight of the carbon dioxide they can hold—it has no bearing on the weight of the cylinder. Whether portable, semiportable or fixed, every carbon dioxide cylinder is constructed of seamless steel with a valve at the top for discharging its contents and a safety pressure disc to safeguard against the possibility of the cylinder bursting if excessive pressure should develop as a result of heat. The cylinders are normally held under a pressure of about 850 pounds per square inch at 70° F. The safety discs are set to release the pressure at 2,700 p.s.i. This pressure will be reached within the cylinder at approximately 135° F.

3–4–8. Fifteen-pound Co_2 Extinguishers

The portable "15-pound" carbon dioxide (CO_2) extinguishers are hung on bulkhead brackets located in spaces where "class B" (oil, grease, paint, etc.) and "class C" (electrical apparatus) fires are most likely to occur, such as the machinery spaces, pump rooms, radio room, galley and forecastle head enclosure. They are the familiar fire extinguisher design, with locking pin, release valve and safety disc on the top and a short discharge hose to which is attached a bakelite horn-shaped nozzle. These extinguishers are of two types, the "disc-type release valve" (*See Figure 19a*) which is operated by a small wheel at the top, and the "squeeze-grip-type release valve" (*See Figure 19b*) which is operated by a simple squeeze grip.

Carbon dioxide extinguishers should not be removed from their brackets except for inspection use, recharging (ashore) and when it is necessary to paint or wash behind them. When removing the extinguisher from the brackets, care should be exercised not to pull the locking pin, otherwise the extinguisher may be accidentally discharged. The holding bracket, name plate, locking pin and release valve with handle should be maintained free of corrosion and paint and coated with light oil. The horn-shaped nozzle should be pressed in the clip on the side of the extinguisher so that the hose and nozzle do not hang free.

As the extinguisher cannot be recharged on shipboard, when one has been discharged, or partly so, *it should immediately be replaced with a spare.* Extinguishers that have been discharged, or partly so, should be tagged or clearly marked *"empty"* and stowed in a location where they will not be mistaken for charged extinguishers. At the time of the United States Coast Guard periodic inspection, all extinguishers aboard the vessel are weighed and either certified to contain the required amount (15

Figure 19b.—Squeeze grip.

2778

Figure 20.—Operating the portable "15-pound" carbon dioxide (CO_2) extinguisher.

pounds) of carbon dioxide, or recharged or replaced with a fresh extinguisher.

The "squeeze-grip-type release valve" has two (2) handles. The lower handle is for carrying purposes, and the upper handle is for operating the valve. To operate the extinguisher, the locking pin, which prevents accidental discharge, is pulled out and the two (2) handles squeezed together. The carbon dioxide will then be released by the pressure exerted on the liquid CO_2 by the CO_2 gas forcing the liquid CO_2 up through the brass tubing in the cylinder and out the discharge hose. The CO_2 remains a liquid until it reaches the horn-shaped nozzle where rapid expansion takes place due to the sudden reduction in pressure as it is discharged into the atmosphere. The shape of the nozzle confines the expansion, thereby building up a CO_2 cloud which is forced out by this expansion and then directed to the base of the fire. The advantage of the "squeeze-grip-type release valve" lies in the fact that the valve can be opened and closed intermittently. If continuous operation is desired, the "D yoke" ring in the carrying (lower) handle can be slipped over the operating (upper) handle when the latter is depressed.

In continuous operation, the effective range of the "15-pound" extinguisher is limited to between 8 and 10 feet for a duration of between 42 and 45 seconds. Due to these limitations, it is essential to move as close to the seat of the fire as possible before commencing to discharge the cylinder.

3–4–9. Semiportable CO_2 Extinguishers

Semiportable carbon dioxide extinguishers are usually located in the machinery spaces and provide means for applying carbon dioxide gas and snow through the nozzle on the end of the hose to any point in the space protected. The carbon dioxide is contained in one or more cylinders bracketed to the vessel's structure. The hose reel or rack may be located immediately adjacent to the cylinders or connected by piping to another location usually adjacent to an exit of the space. The extinguisher is

2779

ordinarily actuated by pulling the handle in a pull box adjacent to the hose reel or rack, running out sufficient hose to reach the fire, and by squeezing the valve lever on the nozzle. The discharge of carbon dioxide snow and gas should be applied from the nozzle closely to the base of the flames in a slow sweeping motion, working the fire into a corner where it can be extinguished without backlash.

3–4–10. Fixed CO_2 System

Fixed carbon dioxide (CO_2) systems are installed in vessels in order to provide a dependable and ready means of flooding a compartment or inaccessible space with this smothering gas. Tank vessels equipped with this system also have it connected to certain pieces of electrical equipment.

The fixed carbon dioxide cylinders are arranged in batteries bolted in frames to the vessel's structure. The number of cylinders in a battery varies, depending on the size of the compartments they serve and the class of the vessel. Valve mechanisms in a battery are connected together in groups. Each group is actuated by remote controlled cable (s) and are connected to the compartment or electrical equipment they serve by fixed piping. This piping terminates in a series of fixed jets, horn-shaped outlets, or perforated pipes, in the fire room, engine rooms, and main pump room.

On certain type vessels the main generator, propulsion motor, main switchboard and cargo pump cubicles are protected by a fixed carbon dioxide system, which can be operated by remote control independent of the fixed carbon dioxide system protecting the machinery spaces. It has its own remote control directional valve station and individual valves that direct the flow of carbon dioxide to the aforementioned electrical equipment. Because of the comparatively small volume of CO_2 released, it is not necessary for personnel to evacuate the machinery spaces when this part of the fixed system is activated to flood only the electrical equipment.

3–4–11. Remote Control Directional Valve Station

The remote control directional valve station is a manifold consisting of a cylinder release and a series of valves that direct the flow of carbon dioxide to the various individual compartments protected. Each valve should be plainly marked with the name of the compartment or electrical equipment it serves. To operate the system, that is—flood a compartment or piece of electrical equipment with carbon dioxide, the cylinder release is first operated then the directional valve serving the compartment or equipment.

3–4–12. Operating Instructions, Fixed System

The operation of fixed carbon dioxide fire extinguishing equipment is quite simple and usually detailed in instruction books aboard each vessel so equipped. All ship's officers should thoroughly familiarize themselves with not only the location of pull boxes, but that portion of the system activated by each box. As explained in "Dangerous Qualities," carbon dioxide is not poisonous, but in sufficient quantities it is suffocating. Therefore, when CO_2 fixed systems are activated into compartments normally worked in or occupied by personnel, an alarm is simultaneously sounded with the release of the gas. All personnel should immediately evacuate the compartment. If the hatches or doorways of the protected area are open when the fire breaks out, close them, provided they can be closed quickly; also secure ventilation system.

3–4–13. Application of Carbon Dioxide (CO_2)

When practicable, *Fires on weather decks should be attacked from the windward side,* so that the wind will blow the heat away from the operator and at the same time carry the gas over the fire. The stream should be directed back and forth slowly across the base of the fire, opening and closing the release valve in the handle as conditions require. When the flame has been extinguished, the entire surface involved in the flame should be coated with carbon dioxide "snow," in order to check incandescense and thereby prevent reflash. When fighting fire in electrical equipment, or on a bulkhead, the stream should be directed at the bottom of the flaming area, moving the horn from side to side and following the flames upward as they recede. While the "15-pound" carbon dioxide extinguishers are designed for hand application, they can be used in a small compartment to provide partial flooding. One or more extinguishers can be placed in continuous operation by slipping the "D yoke" over the depressed operating handle and the

1875 2780

Figure 21.—Typical fixed CO_2 system.

2780

2781

Figure 22.—Remote control directional valve stations.

extinguisher (s) tossed in the compartment, after which the door (s) should be closed. If the compartment is not too large, roughly one extinguisher will cover the bottom of a compartment 11 feet by 12 feet to a depth of 1 foot; this amount of gas will extinguish a fire of proportionate size.

If the fire is in the boiler room, *it is recommended that the fixed carbon dioxide system should be used only as a last recourse.* As carbon dioxide will support neither life nor combustion, before operating the fixed system, all personnel must leave spaces to which the system is connected. Fires must be extinguished and the auxiliaries stopped. Also, to prevent the loss of the carbon dioxide, the ventilation system should be shut down and all openings into the spaces closed. Although the valves in the system may be manipulated to shut off or direct the flow of gas to connected spaces, it is not practicable to shut off the entire system once the cylinder seals are broken when the system is placed in operation.

3–4–14. Recharging Fixed Co_2 Cylinders

Fixed carbon dioxide cylinders are not normally recharged aboard ship. At inspection by the United States Coast Guard, the cylinders are weighed and replaced if not standard. Necessary repairs and adjustments can be made at this time.

3–4–15. Precautionary Maintenance of Fixed CO_2 System

Certain precautionary maintenance measures are necessary to insure that a CO_2 system is ready to extinguish fires. A few of the most important are:

1. Keep the hammer on the chain attached to the pull box and never paint the glass.

2782

2. Never break the glass in a pull box except in an emergency.

3. Keep door (where equipped) at remote control directional valve station closed with lock and hinges working freely.

4. Do not paint name plates, valve stems, cables, sheaves, cylinder valves or other moving parts.

5. Do not adjust piping, valves, levers or attached cable.

6. Inspect fixed jet, horn outlets and perforated piping in system regularly to insure they are in place and clear.

7. Inspect wires and sheaves in system regularly to insure they are clear and appear operative and have not corroded.

The self-actuated carbon dioxide (CO_2) alarms in the compartments served by the fixed system should be tested with compressed air at each periodic inspection (and at 6-month intervals if possible) to insure they are operating properly.

Section 5. STEAM

3–5–1. Steam Smothering in General

Steam smothering systems are generally not installed on new vessels. With the exception of the fire main, the steam-smothering system is the oldest type of fire-fighting equipment installed aboard oil tankers. Its primary purpose is to smother fires in enclosed or confined spaces, during the course of which it tends to isolate the fire from its supply of air (oxygen). Steam also cools the fire and dilutes vapor-air mixtures to the point where they are too lean to burn or explode. The exhaust effect of steam in a tank or other compartment will expel flammable vapors through hatch openings, ullage holes and ruptures. This causes the flame lick to hover above and away from such openings with considerably reduced radiant heat.

Steam is an efficient extinguishing agent for "class A" and "class B" fires, provided there is no appreciable access for air near the surface of the burning fuel. When the steam is shut off, a vacuum is created (due to condensation) in the space surrounding the fuel, which causes fresh air to be drawn in in considerable amounts. Unless the fire is completely extinguished and surrounding surfaces sufficiently cooled, this fresh supply of air will cause the smouldering fire to flare up. Water or another extinguishing agent should be applied before or just after the steam is shut off. This tends to cool the fuel below its ignition temperature and prevent rekindling of the fire.

3–5–2. Steam Smothering System

The main line varies in size up to 5 inches in diameter, depending on the size of the vessel. The main is gradually reduced to a point where the open branch extremities are not less than 1½-inch diameter in any tank and are large enough to adequately flood the tank or other compartment in which it terminates. The United States Coast Guard Tank Vessel Regulations requires that a constant steam pressure of 100 p.s.i. be maintained at the master control valve for fire-extinguishing purposes.

3–5–3. Master Control Valve

The master control valve is located at main deck level either in the engine room spaces or adjacent to the athwartship passageway inside at the forward end of the after house. The location of all master control valves is indicated by a large sign with a "pointer arrow" painted in a conspicuous location adjacent to the valve. The "pointer arrow" should never be painted out. On certain vessels the master control valve may be operated not only at the valve, but also by means of a reach rod extended to the boat deck level.

3–5–4. Piping of Steam-Smothering System

The main steam smothering line extends forward from the master control valve. The line is supported by brackets either above deck or under the fore and aft walkway. It has lines branching off that service cargo and bunker tanks and cofferdams. Branch lines leading from manifolds located along the main line enter the tank or compartment it serves through the deck, except the pumprooms, where the branch lines enter the bilges. All branch lines have individual valves at deck manifolds. The lines are open ended inside the tank or compartment they serve.

Steam-smothering lines leading to forward compartments (paint locker, fore hold, etc.) are usually taken off a branch of the deck steam line. Like the main system, each compartment has its individual valve at a manifold located on the main deck level. Lines leading to forward and after pump

Figure 23.—Steam-smothering master control valve with cover open.

rooms are taken off a branch of the deck steam line and each has its own valve at main deck level outside the pump room it serves.

Steam-smothering lines leading to the engineer's paint locker and the air ducts beneath the furnaces each have their individual valves adjacent to the space protected and are usually taken off the auxiliary steam line in the fire room.

3–5–5. Maintenance of Steam-Smothering System

The steam-smothering system is a part of the vessel's permanent piping system and should be maintained in the same manner as other deck piping.

One of the methods found satisfactory for properly maintaining a steam-smothering system is regular inspection and test every 2 months. At this time and on a ballast voyage, the entire system up to the branch valves should be tested with steam at 100 p.s.i. After a reasonable time and upon finding the system "tight," the pressure is reduced and the branch lines blown through with steam to clear scale, etc.

Low points in the system should be protected from damage due to freezing by opening the drain valves during freezing weather.

3–5–6. Setting Valves on Steam-Smothering System

Steam-smothering lines to cargo tanks, cofferdams and fore deep tanks should be set as follows:

(a) Master control valve shut.

(b) Valves to individual tanks open at all times (except that valves may be closed when necessary to avoid cargo contamination. Also the valve to the fore deep should be kept closed when its being open would result in the fore deep being continuously smothered with steam).

The separate steam-smothering lines to the pump rooms, paint locker, forward compartments, and forehold should be set as follows:

(a) Master control valve shut.

(b) Valves to individual compartments open at all times, except when a valve being open would result in a compartment being continuously smothered with steam.

2784

3–5–7. Application of Steam

Steam as an extinguishing agent has definite limitations. It is effective on small "class A" fires (woodwork, bedding, clothes, stores, etc.) in a closed compartment. However, if the "class A" fire is deep seated, it will only beat down and control the fire, and a solid stream of water will be required to extinguish the embers.

Steam is effective on "class B" fires (oil, grease, paint, etc.) in a closed compartment, but in an open compartment it is likely to be dissipated. Steam acts in a manner similar to that of water fog but with much less cooling effect. Water fog cools the oil as it absorbs heat and is converted into steam and the steam then acts as a smothering agent. The smothering effect is achieved because steam displaces the oxygen of the air that is required for combustion.

In the absence of another extinguishing agent being immediately available, the steam-smothering system should be turned on—if only temporarily—regardless of conditions.

Figure 24—"30-pound" dry chemical extinguisher sectional view.

Section 6. DRY CHEMICAL

3–6–1. General

A development in the field of fire fighting agents aboard oil tankers is the use of dry chemical. The extinguishers are placed strategically throughout vessels where minor "class B or C" fires are more likely to occur.

Dry chemical extinguishers are effective on all "class B" fires (oil, grease, paint, etc.) and "class C" fires (electrical apparatus). The main objection to its use on "class C" fires is the fact that excess dry chemical used leaves a powder residue that may render electrical contacts or relays inoperative. While this powder may be blown or wiped off, such cleaning may be complicated by the delicacy of the electrical circuit or mechanism.

Two of the advantages it has over the carbon dioxide extinguisher are (1) greater range and (2) its stream provides an excellent shield for the operator. In fighting an oil spill fire in the open, the fire is as likely to rekindle or flashback when using a CO_2 extinguisher as when using a dry chemical extinguisher. Other advantages are the ability to recharge cartridge types aboard the vessel and it is non-toxic.

3–6–2. Dry Chemical Extinguisher

The dry chemical extinguisher presently in use is a seamless steel cylinder generally containing foam compatible dry chemical which has been processed to prevent caking and a charge of expellant gas. The charge of expellant gas may be stored in the cylinder or contained in an attached cartridge with pucturing mechanism. The newer stored pressure extinguishers are equipped with a pressure gage so that their condition can be ascertained at any time.

As neither the dry chemical charge nor the expellant gas are affected by normal temperature extremes and do not deteriorate or evaporate, periodic recharging is not necessary. At the United States Coast Guard inspection, extinguishers and cartridges are visually inspected and weighed to assure that they contain the required amount of dry chemical and gas.

Because there are many different methods of operating dry chemical extinguishers only a general description will be given here. Usually there is a locking device to prevent the accidental discharge of the extinguisher. This will have to be unlocked.

2785

It may be in the form of a pull ring pin; it may be that the hose will have to be removed from its stored position; or, it may take some other form. After the locking device is unlocked, then the operating device can be actuated. The operating device is more often a lever which will have to be depressed. On the small models there may not be a hose but the larger sizes generally have a hose with either a nozzle or a cone. Most of the nozzles are of the squeeze grip type which gives control of both direction and flow of the dry chemical.

To recharge the cartridge operated extinguisher, it is inverted and any remaining gas pressure in the cylinder is released by operating the squeeze-grip valve nozzle. The fill cap is then removed and the cylinder refilled with dry chemical powder in accordance with instructions on the name plate. *It is necessary to use the same kind of dry chemical powder to avoid a reaction between different powders which could cause caking.* The expended carbon dioxide cartridge is replaced with a fresh one and after reassembling the cartridge guard, cap and puncturing mechanism, the wire seals are replaced on the cap and ring pin. If a portion of the dry chemical has been discharged, it is only necessary to replace the expended portion: however, the gas pressure must first be released and then a fresh cartridge inserted. It should be noted that some carbon dioxide cartridges have left hand threads. After using, the hose and nozzle should be inspected to assure that they are clear.

Some of the stored pressure type will have to be sent ashore for refilling unless the vessel is equipped with a large tank of the expellant gas and the necessary equipment for recharging.

Care should be exercised when handling dry chemical extinguishers to avoid accidental pulling of the ring pin. The name plate, fill cap, carrying handle, cartridge puncturing mechanism and ring pin and nozzle with valve should be maintained free of corrosion and paint and coated with a light oil or clear grease.

3–6–3. Application of Dry Chemical

Dry chemical should be applied in a manner similar to carbon dioxide (CO_2), except that the powdery chemical must reach the base of the fire.

When practicable, the fire should be attacked from the windward side so that the wind will blow the heat away from the operator and at the same time carry the powder into the fire. If the chemical cannot be discharged to windward of the fire, the operator would still be afforded some protection as the cloud of powder will act as a heat shield. The stream should be directed at the base of the fire.

Section 7.—TYPES OF EXTINGUISHERS

3–7–1. Operation and Instructions

All portable fire-fighting equipment can be placed in the category of first-aid devices, which are provided close at hand for immediate use when needed. It should be understood that they are designed to cope with fires in their incipiency and are considered necessary despite the fact that fixed fire-fighting systems may be installed.

While the methods of operation of the various types of appliances are generally apparent from their very nature, and are indicated prominently on each extinguisher, it is important to give instructions to the ships' crews in order that through familiarity they may more intelligently and more confidently handle appliances during the excitement of a fire and thus accomplish the maximum of fire extinguishment in the minimum of time. These instructions should be supplemented by frequent demonstrations. It is extremely important that the instructions regarding maintenance be carefully followed so that the appliances will be always fully charged, in their designated places at all times, and in such a condition which will permit efficient operation at any moment without delay.

Each type fire extinguisher is of value, but all are not equally effective on various kinds of fires. On this account, consideration should be given to the class of fire which could occur.

All types of portable extinguishers should be properly recharged as soon as practicable after having been actuated and prior to returning to station.

3–7–2. Types of Portable Fire Extinguishers

The types of portable fire extinguishers used on board ships are listed in the following table, which shows the classes of fire each extinguisher is designed for and explains how to operate and maintain each type of extinguisher. This information is being presented in the simplest possible form to prevent any confusion or misunderstanding.

2786

Type of extinguisher	Class of fire: A Ordinary combustibles such as paper or rubbish	B Flammable liquids	C Electrical fires	How operated	Yearly maintenance	Remarks
Water or antifreeze (stored pressure type)	Yes	No	No	Pull locking pin and squeeze valve lever. Direct stream at source of fire. Discharge time is about 45-55 seconds. Range of stream is approximately 30 feet.	Determine that pressure gauge is in operating range and full liquid charge is in extinguisher. Recharge if pressure is low or liquid is needed.	Should never be located where continued temperatures lower than 40°F. may be encountered unless a special chemical charge is used rather than water.
Water, antifreeze or loaded stream (cartridge-operated type)	Yes	No	No	Turn bottom up and bump on deck or pull locking pin and squeeze lever. Direct stream at source of fire. Discharge time is about 45-55 seconds. Range is approximately 30'.	Weigh pressure cartridge and replace if end is punctured or weight is ½ ounce less than stamped on cartridge. Inspect hose to see it is clear. Add liquid to bring contents to fill marker or replace contents. Insert charged cartridge.	Should never be located where continued temperatures lower than 40°F. may be encountered unless a special chemical charge is used rather than water.
Foam	Yes	Yes	No	Turn bottom up. Best results are obtained when discharged against bulkhead just above burning surface so as to permit easy flow over the burning liquid. Stream should never be directed into burning liquid because it would increase chance of spread. The 2½-gallon extinguisher discharges an effective stream of foam for approximately one minute. The range is about 30 feet.	Discharge. Clean inside and hose thoroughly. Recharge.	Should never be located where continued temperatures lower than 40°F. may be encountered. Antifreeze ingredients such as common salt, calcium chloride, etc. *Must not be used* as they may either reduce the effectiveness of the discharge or change the nature of the discharge, or they may corrode extinguishers so as to make them dangerous for use.
Carbon dioxide	No	Yes	Yes	On squeeze grip type pull locking pin and squeeze trigger. On cutter disc type, after unlocking, valve is turned. Direct discharge at base of flames in slow sweeping motion. 15 pound CO_2 bottle will last approximately 12-20 seconds. Discharge has an effective range of approximately 2-5 feet.	Weigh. Recharge if weight loss exceeds 10 percent of weight of charge. Inspect hose and horn to see they are clear.	Although primarily for Class B and C fires, CO_2 can be of value on Class A fires. CO_2 can hold surface flames in check until such time as water arrives at the scene. Pressure inside bottle at normal temperature is about 850 pounds. Safety seal or relief valve is set to go off at 2,700 pounds, which is reached in temperature of approximately 140°F.
Dry chemical (stored pressure type)	No	Yes	Yes	Unlock locking device. Control discharge with operating lever. Direct discharge at base of flames in sweeping motion. Discharge is usually 12 to 20 seconds. Effective range is approximately 10-20 feet.	See that pressure gauge is in operating range. Weigh or otherwise determine that full charge is in extinguisher. Recharge if pressure is low or if dry chemical is needed.	Dry chemical is not affected by abnormal temperatures and is nontoxic. Although principally for Class B and C fires, Class A surface fires may be effectively controlled. In this application, dry chemical should be supplemented with water to extinguish any deeper seated fire which may be present.
Dry chemical (cartridge-operated type)	No	Yes	Yes	Operate pressure cartridge release and control discharge with squeeze grip nozzle. Direct discharge at base of flames in sweeping motion. A 20-pound unit will last approximately 10-16 seconds. Discharge has an effective range of approximately 6-20 feet.	Weigh pressure cartridge and replace if end is punctured or weight is ½ ounce less than stamped on cartridge. Inspect hose and nozzle to see they are clear. Insert charged cartridge. Be sure dry chemical is free flowing (not caked) and chamber contains full charge.	Dry chemical is not affected by abnormal temperatures and is nontoxic. Although principally for Class B and C fires, Class A surface fires may be effectively controlled. In this application, dry chemical should be supplemented with water to extinguish any deeper seated fire which may be present. One great advantage is that this type extinguisher is very simply recharged aboard ship in a minimum time.

2787

Chapter 4

FIGHTING FIRES

Section 1. BASIC STEPS

4–1–1. Detection and Speed

Early detection of a fire is of prime importance if successful fire fighting is to be accomplished. If a fire is detected while still in the incipient state and if the fire can be quickly reached with the proper fire-fighting agent and equipment, there would be little trouble in its extinguishment. Serious fires are often the result of small fires which have not been detected or acted upon quickly and which, reaching dangerous proportions, overpower and overtax the ability of personnel and available equipment.

"Speed" is the essence of fire and likewise the all important requisite of fire fighting. With an understanding of information previously presented in this manual explaining what fire is and describing firefighting agents and equipment, the fire fighter is prepared to review the methods and techniques for its actual control and extinguishment. With little or no experience in fire fighting, he knows in a general way what his task is and he is familiar with the tools and what he can accomplish with them. It remains then for him to apply this knowledge to problems confronting him on shipboard.

The basic steps in *successful* fire fighting are:

1. Locate fire and give alarm.
2. Get fire under control.
3. Extinguish fire.

After sounding the alarm, the fire fighter must quickly determine the following:

1. Where the fire is.
2. What is burning.
3. What is the extent of the fire.
4. What combustibles are in the immediate vicinity—in all surrounding spaces and in the compartments above and below.
5. What vents and other channels are present that would facilitate the spread of the fire.
6. What method of extinguishment is indicated.
7. What is the best technique to prevent the spread of the fire and to extinguish it.

4–1–2. Line of Action

Having learned where the fire is, the fire fighter determines what is burning and how extensive the fire is. In small or incipient fires he would proceed to extinguish without taking extensive measures to keep the fire from spreading, as such measures probably would not be necessary. For the purpose of this chapter, the supposition will be that the fire fighter has to deal with fires that have progressed beyond the incipient stage.

Upon learning where the fire is, what is burning, and the extent of the fire, a fire area is established. Within those boundaries, tanks, hatches and ports are closed. Ullage hole covers, Butterworth plates, tank tops, ventilation ducts, and all other vents not already closed are closed and secured throughout the vessel. Electrical circuits in the vicinity of the fire should be deenergized.

If handling cargo, bunkers or ballast, or if tank cleaning, all operations shall be terminated, valves closed and hose disconnected.

Insofar as practicable fires should be attacked from the windward side. By so doing, wind will carry flames with smoke and fumes away from the fire fighter and at the same time carry the extinguishing agent into the fire. This practice can be of immeasurable assistance, as fires are very likely to get out of control unless the fire fighter can get close enough to use the agents and equipment properly.

Section 2. EXTINGUISHING FIRES

4–2–1. Getting Fire Under Control

Getting the fire under control means the checking of the acceleration in the rate of increase and intensity and is attained largely through preventing ignition of additional combustibles. The fire fighter has all but conquered a fire at the moment he has confined it within the boundaries of an area

2788

he can take care of with the means available and has stopped its further development.

While the work of preventing the spread of fire is underway, the work of extinguishing is not neglected. The two are undertaken simultaneously and they are equally important. The experienced fire fighter would probably say that confining a fire within bounds is the more important of the two. He would consider that a fire so confined is definitely under control. His main problem would then be to put the fire out. The selection of the method of extinguishment is by far the most important decision which must be made by the fire fighter using his knowledge and experience as well as the devices available to him for shipboard fire fighting.

4–2–2. Fighting "Class A" Fires

"Class A" fires in bedding, clothing, wood, canvas, rope, paper, etc., are dealt with by cooling the fire to below its ignition temperature. All "class A" fires leave embers which are likely to rekindle when air finds its way under them. Hence the entire mass must be cooled thoroughly. For this purpose, water is the most effective extinguishing agent. If this were not done and the burning embers below the surface of the combustibles were left uncooled, the smothering fire would raise the temperature of the matter to the ignition point and the fire would break out again. Smothering with steam, CO_2 or dry chemical is not effective in completely extinguishing "class A " fires. However, in an emergency when any of these agents are more readily available than water, any one or more may be used to smother the surface and retard the propagation of the flame.

High and/or low velocity water fog may be used in the initial stages of the fire to get it under control. The fog will also serve a useful purpose in shielding the fire fighter from the heat, and to a limited extent in dispersing fumes and smoke. The solid water stream should always be used for final extinguishment and, if of sufficient pressure, will assist in pulling the burning or smothering combustibles part. In all "class A" fires it is essential that the combustibles be pulled apart to make certain that the extinguishing agent, water, can penetrate and thoroughly saturate all parts of the materials, even though the fire is apparently extinguished.

"Class A" fires are most often attacked from within a compartment. In this situation, if the fire fighter has to enter a hatch or has to advance more than a few paces within a compartment, he should be equipped with a life line. His purpose would be to locate the fire and get close enough to direct the stream and to insure thorough wetting of the burning materials.

On the modern oil tanker the greatest hazard presented by a "class A" fire is the possibility of its spreading to the vessel's cargo or, if in ballast and not gas free, to the explosive vapors in the tanks. Therefore, in putting hose lines into action against the fire, the fighter considers first the direction in which the greatest exposure or hazard lies. If he can do so, he begins operations between the fire and this hazard. From this point first and then from others, water is directed on the fire. When the fire has been extinguished, the fire fighter should stand by to watch for rekindling.

4–2–3. Fighting "Class B" Fires

"Class B" fires are those in flammable liquids such as alcohol, paint, turpentine, grease and all petroleum products where a smothering or blanketing method of extinguishment is essential to cut off the supply of air (oxygen). The extinguishing agents recommended are water, fog, steam, foam, carbon dioxide and dry chemicals. The particular agent or combination of agents will depend in each case on the nature and location of the fire.

When it is said that "class B" fires are those in combustibles that do not leave embers, it should not be concluded that these fires cannot be rekindled. When burning petroleum or other liquid has been extinguished, it may rekindle because of heat radiated from the vessel's structure or other object or from fire in the vicinity if it is more or less at its ignition temperature and its surface is exposed. To avoid rekindling under these conditions, a barrier such as foam, steam or water fog must be maintained between the liquid surfaces and the radiating heat.

"Class B" combustibles release vapors on the surface and, as in the case of all fires, it is the vapor air mixture that burns when the temperature of an object is raised to its "ignition temperature" in the presence of a source of ignition such as a spark or flame. The fire then is all on the surface and when the supply of air is cut off, the fire goes out. It may be that while fire is burning over the surface, only a shallow layer of the combustible is heated to its ignition temperature. In fact, the rate of heat pene-

tration in fuel oil is slow. Fuel oil burning for 10 to 12 minutes may have only an inch deep layer of oil heated to its ignition temperature. The longer a fire burns, the deeper the heated layer of oil will be, with corresponding increased intensity of fire. The problem of extinguishing a fire of this type is aggravated to a considerable degree the longer it burns. The answer is control and extinguishment in the early stage of the fire.

4–2–4. Fire in Cargo or Bunker Tank

To extinguish a fire in a cargo or bunker tank, an attempt should first be made to completely shut off the supply of air (oxygen). This may be accomplished by closing the tank tops, ullage hole covers, Butterworth plates and any other tank opening. In the case of a ruptured tank, thoroughly wetted canvas, bedding or similar material should be used to plug the opening if it is not too large. If this can be done, the steam smothering system (or, in the case of vessels so equipped, the fixed carbon dioxide (CO_2) or foam systems) should be used. Steam smothering valves on branch lines leading to pump rooms, cofferdams or tanks *not* on fire and which are *not* adjacent to such tanks, which are on fire, should then be closed. Water in the form of a solid stream or high and/or low-velocity water fog should then be used to cool the surrounding decks, bulkheads and other structural members. All "class A" combustibles (wood, bedding, stores, rope, etc.) and "class B" combustibles (paint, turpentine, grease and petroleum products) in containers in the vicinity should be removed to a safe distance if possible or, if not possible, thoroughly wet down and shielded from the fire.

If the supply of air cannot be shut off from the fire by closing tank openings, or if the tank is ruptured, foam (special foam must be used for alcohol or other products that mix with water) should be directed into the tank. For this purpose, either the "pick-up" unit or fixed foam system may be used to blanket the burning surface.

Foam applied on "class B" fires forms a stout smothering blanket, the thickness of which is determined by the character and the temperature of the oil beneath it. Oil burning for some time may be heated throughout. When this stage is reached, the foam has a greater tendency to break down and a larger quantity of foam must be applied. In this case, water fog may first be applied sparingly to cool the liquid and when the surface is cooled sufficiently, foam may be applied.

Foam serves exclusively as an extinguishing agent. It affords little protection to the fire fighter against the heat and fumes of the fire and it is not effective for cooling the hot structure of the vessel even after the fire has been extinguished. High-or low-velocity water fog, however, performs both of the latter functions and extinguishes fire as well.

High-or low-velocity water fog is effective for extinguishing high flash point oils by cooling them below their flash point or causing the quick formation of steam, which will drive the oxygen away from the combustion area. On low flash point oils, water fog must completely cover the burning surface and dilute the vapor-air mixture sufficiently to extinguish the fire. In both cases, water fog will slow combustion and absorb radiant heat.

On "class B" fires, steam acts in a manner similar to that of water fog but with very much less cooling effect; also, if injected in an open or ruptured tank, it may escape through the opening (s) to such an extent that it interferes with the fire fighters. It will, however, act as a smothering agent by displacing the oxygen of the air that is required for combustion.

It is accordingly recommended that as a first choice, water fog, or as a second choice, steam, be used in conjunction with foam whenever practicable. Water fog, however, should not be applied simultaneously with or on the foam, particularly if working at close range, as it will tend to dilute and disintegrate the foam blanket.

4–2–5. Fire in Pumproom

In view of the fact that most fires in the pumproom occur in the bilges or at pump level, it is difficult for fire fighters to approach the fire. If the fire is small or in its incipient stage, the portable foam, dry chemical or carbon dioxide (CO_2) extinguishers can be used effectively. Fires in the lower pumproom may also be extinguished by lowering from the main deck level one (1) or more hose fitted with "all-purpose" nozzles and high-velocity fog tips. When available, "fog foam" nozzles with "foam shaper" or "screen assembly" attached, used in conjunction with a fixed foam system, may be used in the same manner. If, however, the intensity of the fire prevents close approach, the pumproom should be sealed by tightly closing all openings and

2790

shutting down the mechanical ventilation system. On ships fitted only with steam smothering, the system should be turned on and the valves on branch lines leading to cofferdams or tanks *not* on fire and that are *not* adjacent to the pumproom should then be closed.

On ships so fitted, the fixed carbon dioxide, water fog or foam system should be turned on. Steam, if available, should be turned on in adjacent tanks and cofferdams.

Regardless of the extinguishing agent used, all tank openings throughout the vessel should be closed as quickly as possible and high and/or low-velocity water fog (or monitors if fitted) should be used to cool the surrounding decks, bulkheads, and other structural members.

4–2–6. Fire on Deck

Such fires may result from cargo overflow, bursting hose or leaking pipeline. The first action should be to shut off the supply of fuel if possible. Foam, if available, should then be applied, using either the "pick-up" unit or the fixed foam system. In such fires it is extremely important that the foam stream be played against a nearby vertical structure of the vessel; this will cause the foam to run down the structure and spread evenly over the fire. Foam can also be "bounced" off the deck ahead of the flowing fuel to splash gently over the fire. A foam stream played directly on the burning oil would cause it to scatter over the deck or dock, thus spreading the fire.

Foam is not effective on flowing liquids as the movement of the liquid prevents its forming a blanket. Therefore, if the supply of the fuel cannot be shut off and it is burning at its source, some other extinguishing agent must be used to extinguish the burning stream. For this purpose, portable carbon dioxide (CO_2) or dry chemical extinguishers or water fog are effective when applied directly on the burning fuel as it emerges from the opening. Foam should be sprayed ahead of the flowing fuel to form a dam and thereby prevent the spreading of the fire.

High- and/or low-velocity water fog should be used to augment the foam and to cool the surrounding structure of the vessel and to protect the fire fighters using the foam, thereby permitting them to approach closer to the fire. However, the water fog should be used in such a manner so as not to affect the firmness of the foam blanket or dam.

All tank openings throughout the vessel and the pump rooms should be closed as quickly as possible.

4–2–7. Fire in Machinery Spaces

To extinguish a fire of this type, an attempt should first be made to extinguish it by means of the portable foam, dry chemical, or carbon dioxide (CO_2) extinguishers or foam "pick-up" unit (or fixed foam system) or waterfog, depending on the location and type of fire. *The fixed carbon dioxide system should be used only as a last recourse when all other means of extinguishment have failed.*

As carbon dioxide will support neither life nor combustion, before operating the fixed system, all personnel must leave spaces to which the system is connected; the boiler fires must be extinguished and the auxiliaries stopped. Also, to prevent the loss of the carbon dioxide, the ventilation system should be shut down and all openings into the spaces closed. Except in an emergency, spaces that have been flooded with carbon dioxide should not be opened for at least 10 minutes after flooding. This is a precautionary measure to allow burning substances time to cool down below their ignition temperatures and thereby prevent their reignition upon the admission of fresh air (oxygen).

Regardless of the type of extinguishing agent or equipment employed, waterfog should be used when necessary to protect the fire fighters and to cool the hot structure of the vessel.

4–2–8. Bilge Fires

Since it is difficult to gain access to this type of fire, low-velocity waterfog should be used with an applicator in conjunction with foam applied as described under *Fire on Deck.*

4–2–9. Spill Fires on Floor Plates

As this type of fire is usually due to a ruptured fuel line or leaking connection to burner, the source of the supply should first be shut off. The fire can then usually be extinguished with a portable foam, dry chemical, or carbon dioxide (CO_2) extinguisher or, if necessary, waterfog. In this case, low-velocity is more effective and is recommended over high-velocity fog.

0275
2791

Small or incipient fires in the fire room can often be extinguished with sand spread with the scoop.

4–2–10. Burning Oil on Water Surrounding Vessel

The most effective manner of fighting a fire of this type is to apply foam as described under *Fire on Deck*. If possible, the foam stream should be directed against or as close as possible to the side of the vessel. This will cause the foam to flow outboard over the surface of the burning oil in an even blanket.

In the event sufficient foam is not available, solid streams of water should be directed at the edges of the burning oil, thus setting up a surface current which may carry the oil clear of the vessel.

When applying foam and/or water as described above, wind and current conditions must be taken into account. If the wind is blowing in the *same* direction as the current is flowing, the application should be to windward and above the oil. If, however, the wind is blowing *opposite* to the flow of the current, the application will depend on which is the stronger. The object is to apply the foam and/or water so that it flows down on the oil carrying it away from the vessel.

Preparations should be made to get underway; if advisable, the vessel should steam clear of the burning oil.

4–2–11. Fighting "Class C" Fires

"Class C" fires are those in electrical equipment that may be caused by short circuits, overheating, or the spreading of "class A" or "class B" fires. When equipment so involved cannot be deenergized, the danger of electrical shock and short circuiting must be guarded against. Pure distilled water is not a conductor of electricity; fresh water usually is because it contains minerals. The conductivity of sea water is many times greater than that of fresh water.

In view of the above, a solid stream of water must never be used to extinguish fires in electrical equipment that is energized. The hazard is reduced, but not entirely removed, when water is applied with the high-velocity fog tip on the "all purpose" nozzle and further reduced when applied with the low velocity fog head on the "applicator." Therefore, in so far as practicable, electrical circuits should be deenergized before any extinguishing agent is applied.

The portable carbon dioxide (CO_2) extinguisher is usually the most readily available extinguishing agent and is recommended as first choice as it is a nonconductor of electricity, offers protection to the fire fighter against electric shock and is less likely to damage equipment.

The fixed 50-, 75-, or 100-pound carbon dioxide (CO_2) cylinders, where installed should be used when required. However, the fixed system protecting the machinery spaces should only be used as a last recourse, when all other means of extinguishment have failed.

Dry chemical, if available, is an excellent extinguishing agent. However, it is not as satisfactory as carbon dioxide as it leaves a residue.

On "class C" fires (electrical apparatus) when the equipment is deenergized and when neither carbon dioxide nor dry chemical is available, waterfog or foam may be used.

4–2–12. Liquefied Flammable Gas Fires

Methods of combatting liquefied flammable gas fires aboard ship depend primarily on the equipment aboard the individual vessel. However, fires of escaping liquefied flammable gas should generally be extinguished only by stopping the flow of gas. At the same time water spray should be used to cool surrounding material while shutoff efforts are underway. Extinguishing a large LPG or LNG fire and permitting the gas to continue flowing can be dangerous in that a flammable mixture may be formed in the air—the ignition of which may cause far greater damage than if the original fire had been allowed to burn.

Flames from small leaks may be extinguished by utilizing carbon dioxide or dry chemical extinguishers, provided so doing permits closing valves to stop the flow of gas.

If fire is adjacent to an LPG container, but no gas is escaping, immediate steps should be taken to keep the container cool, thus diminishing the possibility of a buildup of pressure, or the container should be removed immediately from the fire area if this is possible.

Chapter 5

CASE HISTORIES OF TANKER AND BARGE FIRES AND EXPLOSIONS

Section 1. CAUSE AND EFFECT, METHODS OF EXTINGUISHMENT

5–1–1. General

In this chapter we will consider some case histories of fires involving petroleum tank vessels and barges. We will discuss various methods of extinguishment, comment on prevention of that type of fire and touch on various lessons to be learned from the fire under consideration.

Prior to proceeding to tales of flame and destruction, consider the fact that will help you to evaluate the pictures we are about to draw. This fact is that the handling of petroleum products in tank vessels and barges can be done with utmost safety if certain well known precautions are taken. Hundreds of thousands of barrels of flammable products are handled daily without incident.

Where fires do occur, the basic cause can usually be traced back to human failure—a failure to do something or a failure not to do something.

5–1–2. Smoking

Examples of fires will be discussed in the approximate frequency of their occurrence. Most fires aboard tank vessels and barges occur in the living quarters where the contents of wastebaskets are ignited by discarded smoking materials. Such fires rarely do much damage. They may be readily extinguished by placing the basket in a shower or by use of the nearest hand fire extinguisher. This type of fire can easily be prevented by keeping the quarters shipshape, by keeping wastebaskets cleaned out and by the disposal of smoking material into ashtrays or specially designated containers.

Experience has shown that it is a good idea to have metal wastebaskets. They should not be wire mesh nor fiber of the type that may burn. One vessel we know of had 3 fires in 1 night in wastebaskets—a sad reflection on the standards of housekeeping found on that ship.

Probably the next most frequent fire is that of mattresses or bedclothing igniting from smoking in bed. A man exhausted from lack of sleep might become involved in such a fire. Likewise, there are a few individuals who are abnormally hard to waken. They, too, might be unaware of burning bedclothes. Then there is always the suspicion that the person involved had a few drinks; not drunk perhaps, but with "sufficient aboard" to dull his senses. Generally, some one smells the smoke and hauls the sleeper out; here's a case where they didn't get there in time.

A master lost his life from smoking in bed. The ship was in port alongside a wharf. Smoke was detected on the bridge, coming from the speaking tube leading to the master's quarters. The door to the quarters was opened and his body was found on the deck. The mattress was on fire. An autopsy revealed that he had died from lack of oxygen. It also showed that he had had a few drinks but that he was not drunk. The fire had consumed the oxygen in the air. The man had apparently attempted to reach the door but hadn't made it.

Extinguishment of fires in mattresses is extremely difficult. We know of one case where a mattress caught on fire. Our hero, stimulated by having a large hole burned in his shorts, sprang from bed, threw the mattress into the nearest shower and soaked it thoroughly. He then placed it on a steel deck. Next morning all that remained were the steel springs. Deep-seated fires in mattresses should be extinguished with plenty of water and by pulling the stuffing out. Since the mattress would be ruined, it is probably better to throw it overboard. *This should not be done in port.* Some ships prohibit smoking in bed. Others concentrate on seeing that adequate ashtrays are on hand. It is excellent practice to have routine fire inspection made of the quarters, paint lockers, and storerooms during the night watches when people are not up and around.

There have been occasional fires in linen lockers on tankers. Here is an example.

At approximately 1100, while the ship was in port, a mess man was sorting ship's linen to be sent

sers

2793

ashore for laundering. He was smoking and hot ash was accidentally knocked from the cigarette. After what he thought was a careful search he concluded it was not in the laundry pile.

At 1225 the steward was in the adjacent passageway. He smelled smoke, investigated and found the soiled linen and wood-covered bulkheads aflame. He passed the word and the general alarm was sounded. The officers and members of the crew used a few buckets of water and the fire was extinguished. The fire hoses were extended in readiness but were not used.

Damage, amounting to approximately $2,000, was confined to paint, steampipe lagging, electric wiring, 20 sets of linen, and the wood-covered section of bulkhead.

5–1–3. Galley Fires

Accidental fires in the galley are not numerous but they do occur. Here is an example.

The fuel tank for the galley range was located on the starboard side of the poopdeck, above and slightly to the stern of the galley skylight. At 1800, while this tank was being filled with kerosene, the kerosene spilled over, mostly onto the deck underneath the tank. Some of the kerosene splashed through the open skylight onto the hot galley range, ignited and communicated the flames to the kerosene on the poopdeck.

The fire on the deck was extinguished with water hoses within 6 minutes. The fire on the galley range involved the range's grease trough but was extinguished with a 2½-gallon foam extinguisher.

Here's what happened. Kerosene had been loaded into the galley bunker tank, leaving 7- or 8-inch outage. The ship's filling line valve had been closed at 1815.

A few minutes later, the wharfman on the dock asked the boatswain to open the galley bunker line valve so the dock hose could be airblown. The boatswain complied. When the hose was blown, the extra product in the line was blown into the tank where it overflowed. The fire was discovered by the mate, who was on the bridge wing. The mate sounded the alarm, and called the engineroom, ordering the fire pumps started. The ship's officers and men manned three hoses. On arrival on deck in response to the alarm, the chief mate ordered the dock to shut down all cargo loading. He ordered the seamen on deck at the risers to shut down the ship's risers and disconnect the cargo hose. He also ordered the boatswain to turn on the steam smothering to the cargo tanks.

Damage amounted to $1,500. It included severe damage to the handwheel, the taffrail, the log rotator and connector, the vegetable bins, and electric wiring to the binnacle. Paint on the deck, bulkheads, emergency wheel, engineroom telegraphs, rudder indicator, and bunker tank was charred, blistered, and smoked up in varying degrees.

Fire in galley ranges using diesel, stove oil, furnace oil, or kerosene as fuel may be readily extinguished with waterfog.

Another type of galley fire is sometimes found where bottled gas is used as fuel. Here is a case.

The cook turned the oven on approximately 20 minutes before the accident to prepare for baking. There were also one or more burners going on top of the stove. When he opened the oven to place a tray of cookies inside, a flashback took place. The man was burned about the arms and face. Apparently the pilot light to the oven was out when the man turned the gas on. It became ignited from the burner fires on the top of the stove. Explosions of this type may be prevented by proper maintenance of pilot lights, by shielding from drafts and, above all, by personnel making sure that ovens are lit.

5–1–4. Spontaneous Combustion Fires

A source of fire against which seamen must be constantly on guard is that of a spontaneous combustion. Spontaneous combustion occurs when vegetable oils or paints oxidize under conditions that permit the heat of oxidization to be retained and to build up to the point where something is set on fire. The usual case is an oil-soaked rag. Here is an example of such a fire in the deck paint locker on a T–2. This compartment is located under the fo'c's'le head. Details are given in the master's report.

DEAR SIR: This is to inform you that while this vessel was proceeding from Honolulu towards San Pedro on the morning December 18th at 1 A. M., smoke was detected from the bridge coming from forward. A man was sent to investigate and reported a blaze in the paint locker. The general alarm was sounded, the vessel was stopped and run before the wind. Bulkhead doors were closed, steam smothering lines opened, and water turned on main fire lines. Due to quick action, the fire was extinguished in a few minutes with minor damage. Upon investigation, it was found that the fire was caused by spontaneous combustion of waste paint

2794

rags, and could have been serious under certain conditions.

The crew were assembled at quarters the following day and lectured on the hazards of leaving rags and other waste material in all parts of the ship, including excess wastepaper in the baskets in their quarters. Officers were cautioned to see that periodic rounds of the ship on their respective watches were made during the night.

If the crew will take the above instructions to heart one-half as much as they do their overtime, I believe we will have no more fires from this cause.

Respectfully,

_____ _____
Master

The letter outlines methods of extinguishment. While the letter doesn't say so, water fog was also used. This type of fire may be prevented by keeping paint lockers shipshape or, to use another term, by good housekeeping; *Specifically, waste materials, oily rags, etc. should be disposed of properly.*

5–1–5. Boilerroom Fires

Here's an example as told by a chief engineer:

Once upon a time there was a fireman that fried himself. We were headed home from the Canal when it happened. The 12-4 fireman put in a burner and didn't get it in quite straight. When he turned on the oil, a little leaked out. Instead of shutting off the oil, which was easy—there was a valve right at his fingertips—he slacked off on the yoke and tried to straighten the burner. That did it. Oil blew out in a fan and caught fire. The fuel pump took off. I was up forward at the time. When I got down below the second was trying to get into the fireroom. There was quite a blaze going by this time. The bitumastic on the fireroom tank tops melted and caught fire. We secured the engines to keep our steam, laid out fire hose and started to move in. At the same time we shut off the fuel pumps with the reach rods that run to the boat deck. We soon got the fire out.

We found the fireman. He had gone up the escape, crossed over the back of the boilers and was down on one of the gratings. He was a mess—burns and fuel oil—but still alive. We got him out of there and started to work on him.

Sparks was pounding the key, and as luck would have it, raised a battleship. She was just a few miles from us, hull down on the horizon. We both headed for each other and in short order one of the battleship's boats was alongside. We got the fireman onto a stretcher and into the boat. They were able to save him. I saw him about a year later. He was all right except for a few scars. Bet he never pulled a live burner again.

This type of fire can be prevented by firemen shutting off the oil before slacking off burners. There are also several mechanical devices that can be installed in the burners which will limit the flow of oil and, in most cases, stop the flow of oil if a fireman pulls a live burner.

Duplex fuel oil strainers have also been the seat of fires when, through mistake, the cover has been partially removed from the strainer in use. Removal of the wrong cover may be prevented by installing a flat shield on the switchover lever. Strainers should be so located that hot furnace fronts will not be sprayed with oil should a cover warp or otherwise spring a leak. A Liberty was lost several years ago when a fire occurred in her fireroom. Something happened to the cover on the strainer and fuel oil sprayed onto the furnace fronts and ignited. The loss of a vessel from a fireroom fire is a story in itself but it leads us logically to a consideration of how such fires can be controlled.

We can group both of the examples cited above under the heading of spilled oil and make these general statements. If the spill of fuel oil is small, the fire may be fought with hand extinguishers or sand. If the fire is being fed with oil under pressure, *the flow of oil must be stopped* before the fire can be extinguished. Action required in each case must be decided on the spot. Many things may need to be done almost simultaneously. If underway, the main engine may have to be stopped, the chief engineer and the bridge notified, a general alarm sounded, the induced and forced ventilation in the fireroom stopped, the fire pump started, the fuel pump shut off and the fire attacked. Water fog or foam are particularly effective in fighting fires in fuel oil. If the fire cannot be extinguished with water fog or foam, then the space should be sealed and the CO_2 flooding system used if provided.

Here's another example of fire in a fireroom.

A motorship was moored to a refinery dock and was discharging heavy residual fuel to shore tankage. At 1110 a fire occurred in the air ducts of the motorship's auxiliary boiler, which furnished steam to the cargo pumps.

Fuel oil drippings, from burner changing operations, had been allowed to accumulate for a considerable period. The burners had been changed just before this fire, and some hot oil had been permitted to drip into the duct. When the burner was lighted again, a flareback ignited the vapors from the hot oil in the duct.

The first assistant engineer decided to control the fire in the duct with CO_2 from hand-portable fire extinguishers and with water fog nozzles, and allow it to burn out. The dock man was notified after the fire had burned for approximately 1 hour and when replacement of the contents of the sev-

2795

eral fire extinguishers used was obviously required. The dockman transmitted the problem to the refinery fire chief, who responded with a supply of replacement extinguishers and a small crew. These augmented the efforts of the first assistant engineer and his men, materially assisted in keeping the fire under control, and prevented further damage.

The oil accumulation in the duct was larger and more extensively spread than the first assistant engineer had thought. The fire gradually spread and involved almost the entire area of the duct under the boiler.

The heat of the fire warped, buckled and damaged the duct plates, the boiler front casing, its supports and the front brick-supporting plates of the firebox, to the extent of $12,500.

Lessons: Proper instruction in burner-changing operations by the engineers would have prevented oil dripping into the duct, or at least would have *required oil drippings to be cleaned up* on occurrence, thus preventing accumulation and subsequent ignition.

Judgment on the part of the first assistant engineer in this case should have dictated; rather than letting the fire in the ducts burn—immediate extinguishment, boiler shutdown and cooling the fireboxes, followed by thorough cleaning of the air ducts.

5–1–6. Air Heaters

The next topic that might be taken up is fires in the uptakes of boilers fitted with air heaters. Here is what a chief engineer has to say on the subject.

On numerous occasions, fires have occurred in air heaters of water tube boilers resulting in considerable damage and resultant delay of vessels for repairs. The majority of these casualties undoubtedly were due to neglect on the part of those responsible for the upkeep of the boilers, in that soot blowers were not properly used.

In most cases where fires have occurred, it was found that the soot blowers had not been used frequently enough. This is particularly liable to happen on vessels that have been in port for an extended period of time. Poor combustion and unsatisfactory cleaning of boiler heating surfaces during repair periods are contributing factors in air heater fires. If soot deposits are allowed to accumulate in the uptakes and stacks, they may be loosened by mild explosions or vibrations and drop onto the tops of the air heaters where they may become ignited and burn, melting the air heater tubes. The mild explosions referred to may be caused by the practice of lighting burners from hot brickwork or from inserting a torch in a gassy furnace without first purging the furnace by opening the air registers. A mild explosion in a dirty furnace may produce a serious explosion in the following manner:

The first explosion dislodges soot and carbon which floats in the air like a cloud of dust. This material then ignites and explodes with considerable violence. Incandescent carbon particles, due to incomplete combustion; are carried through the gas passages of the boiler, settling on air heater tubes, and start burning when disturbed by excess draft.

Fires in air heaters may be prevented by maintaining good combustion and knowing the normal temperature above and below air heaters and immediately investigating any abnormal difference. Soot blowers should be frequently and properly used, especially when there is a light load on the boilers. When using soot blowers, blow air heaters first then start at the bottom and work up, finishing with blowing air heaters for the second time as outlined in instruction books. Increase the forced draft fan pressure approximately one inch while blowers are in use. Hand torches should be used when lighting off burners, and oil should be recirculated so that immediate ignition takes place when the torch is applied. Frequent inspection of the heating surfaces for soot accumulation should be made, especially of those parts not cleared by the soot blowers. When hand-cleaning the surfaces of boilers, start at the top and work down.

In the event of a fire starting in the air heater of a boiler, immediate action is to shut down the boiler by shutting off the oil supply. All burners should be removed, air registers shut, forced draft fan stopped and inlet damper closed. The water level in the drum should be raised to a full glass and, if the vessel is underway, the bridge should be notified that the vessel's speed and maneuvering ability will be restricted. Locate the fire by opening the access doors in the uptakes and flood the area with CO_2 gas or other fire extinguishers. Water may be used if no other means of extinguishing the fire are available. Don't flood the engine room with CO_2 gas as was done on one ship.

Do not use soot blowers to extinguish the fire as such action may stir up a carbon dust cloud, which might ignite and explode.

Fires in stacks are not common in the modern-day vessel. What may be referred to as a stack fire is more probably a fire in the economizers or air heaters. As noted above, these may be fought with CO_2 or, as a last measure, with water. As with most fires, they are easier to prevent than they are to extinguish. Faithful use of the soot blowers will prevent conditions in air heaters, economizers and stacks that will make fires possible.

5–1–7. Fires From Using Gasoline To Clean Clothes

Since it is possible for crew members to surreptitiously obtain petroleum products from the cargo, there have been fires from using improper cleaning oils.

A tanker was discharging casinghead gasoline. At 1215 an explosion took place in the after quarters. Fortunately no one was injured and the damage to the ship was slight. The potential hazard, however,

2796

was very great. Had the fire spread to the cargo, it could have been a catastrophe.

Here's what happened. The engineer on watch and the oiler, on hearing the blast, checked over the engineroom and finding everything in proper order, investigated and found a fire in the laundry room on the port side. The fire seemed to be around the washing machine and in the forward outboard corner of the room. Some rags or clothes were burning on the deck of the laundry. The engineer and the oiler grabbed a 2½-gallon foam extinguisher from a bracket in the alleyway and put the fire out. By this time, the deck gang had shut down discharging and joined the fire fighters.

The washing machine was found to be about one-quarter full of a liquid which gave off a strong, gassy odor. A sample of this liquid was tested in a lab and found to be pure casinghead gasoline. The casinghead was drained out of the machine and the space was ventilated. The discharging of the cargo was resumed.

Accidents are investigated so that we may learn how to prevent similar accidents; therefore, let us consider what lessons this fire teaches.

First and most important:

Never use gasoline for cleaning purposes.

Clothes should never be washed in a ship's washing machine with a petroleum product. Any petroleum product heated above its flashpoint will give off vapors that can be ignited. Kerosene is thought of as being comparatively harmless. Put it in a washing machine, mix with hot water and the kerosene will give off vapors that can be exploded quite as readily as those of casinghead.

Here is another case. A tankship had been loading gasoline for about 6 hours at 3,000 BPH.

A crewman secured a bucket of gasoline for cleaning clothes and was doing the cleaning in the after quarters. The gasoline vapor ignited from some unknown cause. Apparently considerable vapor had accumulated because in the vapor flash, 10 men were injured, 4 fatally. One of the men ran out on deck on fire and in passing the tank tops with open ullages, four of the ullages ignited.

Under considerable difficulty because of smoke, the fires in the quarters were extinguished with water streams. The ullage fires quickly subsided as loading was shut down and the subsequent small vapor fires were readily extinguished as the plugs were closed.

5–1–8. Pumproom Fires

Any fires involving cargo are extremely serious. In many cases the fire may be preceded by an explosion.

The most likely location for a cargo fire to occur is in the pumproom. This is because there are generally small leakages of fuel from, say, pump glands. On occasion there may be larger releases of fuel, either through accident or during normal operations. Changing blank flanges sometimes allows petroleum products to drain out of the lines. There are potential sources of ignition in rapidly rotating machinery. Then there is the human factor. Since this is a space which men enter, they may do something that provides a source of ignition. Here is a case.

Case I:

The ship was at sea with a full load of casinghead gasoline. A new second pumpman had been hired at the previous port. He had been instructed clearly regarding smoking rules on the ship.

After the ship had been at sea, he had been given the job of cleaning a strainer on a suction line to one of the pumps in the pumproom. While he was removing the cover plate on the strainer, a flash fire occurred in the bilge. There was no explosion. He escaped with serious but not fatal injuries.

Smothering steam was opened to the pumproom and three water hoses played into the open door at 0903. Heavy smoke continued and at 1010, the ventilators were covered with wet canvas to aid in smothering the fire. At 1045, a heavy explosion blew out one skylight cover and sprung the other. Shortly afterward a second explosion of lesser intensity occurred. At no time was there any flame visible on deck. At 1233, the ship arrived at port and was anchored. By 1250 the fire burned itself out.

The investigation indicated that presumably a valve packing gland leak or gasket leak had caused a small skin of gasoline to collect in one part of the bilge but not where the man was working. Apparently he left the job, where he put his tools down in orderly fashion, and walked over to where he could see above and then stepped back and lit a cigarette.

Evidently the small bilge flash and fire ignited paint which did not respond to the remote water streams or steam smothering. There was no evidence of fire where the man had been working near the pump. Very likely the fire heated closed-in pipelines containing the gasoline and the pressure caused a gasket to fail at a point some distance from the flame. The delayed ignition caused the low grade explosion.

The lessons that can be learned from this fire are obvious. Tankermen will find it hard to believe that anyone would smoke in a pumproom but it did happen and it's not the only case. We know of another tanker where a chief engineer was killed in a pumproom explosion. Once again the source of ignition was smoking.

2797

Case II

Here's another case of a pumproom explosion.

A vessel was discharging a cargo of natural gasoline. Early in the morning, the starboard main cargo pump was shut down because of a broken steam valve rod. It was necessary to repair the starboard pump in order to complete discharging the cargo. Accordingly, at 1015, the vessel shut down and started circulating the lines in the pumproom in order to flush out the gasoline. About 1100, seven men were in the pumproom. One man was making a survey of the repair work, the others were washing the bilges preparatory to their being tested by a yard chemist.

At 1113, an explosion occurred in the pumproom that shook the ship and was audible at some distance.

Two of the men were killed by the explosion and the others were burned. They were hospitalized and recovered.

Investigation showed that the source of ignition was a portable electric extension light which had been dropped in the bilges. The source of fuel was a small amount of natural gasoline in the bilges.

This casualty emphasizes the necessity for certain pumproom precautions. First, when the vessel is not gas-free no portable electrical equipment is permitted in cargo or fuel oil tanks, or cargo pumprooms, or in any enclosed space immediately above or adjacent to the bulk cargo tanks, except that lighting may be obtained by the use of approved explosion proof self contained, battery-fed lamps. Second, such spaces should be tested with a gas indicator when there is any doubt it contains explosive mixtures of petroleum products. Third, it shows the importance of keeping the bilges clean.

Another lesson taught is the need for good ventilation in pumprooms. This need has been answered in modern pumprooms with power ventilation taking suction in the bilges and gratings instead of floorplates to promote good ventilation.

5–1–9. Cargo Tank Fires

Fires in cargo tanks are unusual but when they do occur the results may be tragic.

Case I

A T-3 tanker was loading butane blend (a synthetic casinghead gasoline) into a number of tanks. Other tanks had already been loaded with a variety of petroleum products, aviation gasoline, ethyl gasoline, and diesel and stove oil. Two tanks were empty. Loading continued without incident from 1600 until 0200. At that time, there were two extremely severe explosions.

Shortly after the explosion, fire-fighting parties reported to the scene.

As a result of their efforts and the fact that there was no current and no wind, the fire was held in check and by mid-afternoon was extinguished.

Thirteen lives were lost, the vessel was a total loss and the wharf was destroyed.

Here is how we reconstruct events. It was an unusually calm night. The butane blend was being handled at or above its boiling point so that unusual amounts of vapor were being released through the ullage holes. A vapor cloud formed on deck so dense that men could not work in it. Inevitably this cloud reached a source of ignition, probably in the midship house in the quarters. The flash fire was communicated to the empty tanks through the open unscreened ullage holes. The tanks exploded and ruptured adjacent bulkheads, releasing fuel to the fire. The fire spread on the water over a large area and burned itself out.

The residual fire on the ship was extinguished with water.

There are two lessons to be learned from this casualty. Should vapors accumulate on deck, all cargo handling should stop. Empty tanks into which no cargo is being loaded should have their ullage plugs dogged down.

Here is a case. Two supertankers collided in inland waters. One vessel was empty. She caught fire and exploded. The fires on her soon died out as the fuel was consumed. The other vessel was loaded with 160,000 barrels of gasoline. She caught fire forward and ultimately all eight gasoline cargo tanks were aflame. Flames were coming from cracks in the deck plating, from vents and from cargo hatches.

The task of extinguishing the fire became too great for local fire officials. After the fire had burned for 3 days, a Navy tug and a U.S. Navy fire-fighting party took on the task of extinguishing the fire. Two slow passes were made alongside the tanker while four monitors on the tug sprayed the decks of the tanker with sea water for cooling purposes. A third pass was made using foam from the tug. Fires were extinguished forward on the tanker enough to allow boarding her forward and fight the fire close at hand. Foam was introduced through small openings in the tank tops. The blanketing of the liquid surface in the tanks with foam soon had the fires extinguished. Other parties extinguished minor class A fires in the forecastle and, later, the poopdeck area.

Fire-fighting evolutions were halted for approximately 4 hours at one period due to an insufficient foam supply. Cooling down operations were conducted during the interim to reduce the possibility of a reflash.

While reportedly some 92 percent of the cargo was saved, the economic loss from the collision was about $12 million.

The navigational aspects of this accident are beyond the scope of this manual. One lesson taught, and a most important one, is that trained men with proper equipment and under favorable conditions can extinguish a major oil fire in cargo tanks.

Case II:

Here is a report from a tanker.

During routine tank cleaning in a ship, one of the tank washing machine nozzles in use became trapped. Unsuccessful efforts were made to clear it from on deck and it was soon obvious that someone would have to go down in the tank, which was known to be gassy. An air line mask was rigged and one of the crew, wearing breathing apparatus and harness, with a lifeline attached, started off down into the tank with a companion handling his lifeline and air hose. The line tender leaned over the tank hatch to keep his man in sight. As he did so his cigarette lighter fell from his shirtpocket, struck the bottom of the tank and ignited the vapors generated from a small quantity of oil. The intensity of the fire which followed burned both lifeline and air hose.

2798

cers

The men on deck could do nothing for the man in the tank, except put out the fire and wait for the tank to become cool enough to recover his body.

Men engaged in tank cleaning, cargo handling, and pumproom work should not carry smoking materials. Some habitual smokers may, on occasion, light up without thinking and without regard to location.

5–1–10. Tanker Fires in Shipyard

Tank explosions in shipyards can be disastrous. Here is a report.

While a tanker was at a shipyard, No. 7 tank was tested and found gas free. Three days later, it was considered necessary to burn the bonnet off a "frozen" valve in this tank. In preparation for the burning, a ship's engineer removed the drain plug from the valve and tasted water. Next morning the engineer, the yard foreman, and a burnerman entered the tank. Apparently there was nothing that indicated danger to these men. The burnerman lit his torch and there was an explosion that burned him so badly that he later died. A chemist made an inspection immediately after the accident and found gasoline dripping from the valve.

This accident illustrates the results of a poor job of cleaning the ship for the yard. It demonstrates that pipelines are difficult to gas free. Pipelines should always be suspected until proven otherwise. The accident emphasizes the fact that a gas-free test is only good for the moment that it is made. Good practice requires that additional tests be made with a gas detector when sediment in tanks or compartments is disturbed, ballast shifted, pipelines disconnected, tank tops closed, or when other conditions arise which would affect the vapor content.

5–1–11. Barge Fires

Fires in petroleum barges follow the same pattern as those in tankships. This case is an excellent example of the right and wrong way of attacking a fire.

The barge was nonpropelled with gasoline engines for the pumps. These engines were housed in an engine room aft on the main deck. The pumps were a deck down in another compartment and were separated from the engines by a gas-tight bulkhead. The engines drove the pumps through the medium of V-belts. The gasoline pump engines were fed fuel by gravity from a tank situated on the top of the engineroom house in the open. Flexible feed lines ran from the tank to the engines. One day one of these lines broke from vibration and sprayed the engine with gasoline. It ignited. The barge crew discharged the contents of a 40-gallon extinguisher into the engineroom. As might be expected, this failed to put the fire out. The crew then cast the barge off the wharf. Her launch took her in tow on a headline. All hands got on the tug. They let the towline out as far as it would go and hauled the burning barge back to the home port, a distance of some 40 miles. Here a tug heavily equipped with fire-fighting gear put the fire out. They led three 2½-inch hose streams into the engineroom and blasted the fire out in nothing flat. Hauling the barge home was the wrong way to handle this type of fire.

Ten years later—same barge—different crew. Despite improvements in the feed line, exactly the same thing happened. The feed line broke and sprayed an engine with gasoline. It ignited. The barge master did the right thing and the thing that should be done with all petroleum fires of this type —he shut off the flow of fuel into the fire by closing the valve at the base of the fuel tank on the top of the engineroom house. He then was able to extinguish the fire quickly with a 40-gallon foam extinguisher.

5–1–12. Summary

We could go on at length describing fires; however, we have touched on the main types. One distinction should be made. In the small fire, fire fighting can control the fire. In those rare and catastrophic fires, all the damage is done in the first moments and fire fighting is sort of a mopping-up operation.

Precautions taken to prevent fire loss can normally be justified in greater detail on tankships and barges. This is because of the intrinsic value of the equipment, and because the crew may not be able to escape the fire area without considerable added risk to themselves. Fires on tankships and barges may occur in the quarters, in the galley and storerooms, paint locker, engineroom, pumproom, or in the cargo tanks. Fire in the quarters is most frequent and usually results from improper disposal of smoking materials.

ABSTRACT - Developed by business educators for use in teaching office machines, this document contains a series of tests for the beginning unit covering calculating machines. Designed to evaluate student performance in relation to stated terminal objectives, the tests cover: (1) the full-keyboard adding listing machine, (2) the key-driven calculator, (3) the ten-key adding listing machine, (4) the rotary calculator, and (5) the printing calculator. Also included is a suggested grading scale. Unit two is available as VT 012 222, also in this issue. (JS)

CALCULATING MACHINES I

8.0.0 TERMINAL PERFORMANCE OBJECTIVES: The following objectives are a precise statement of the minimum performance required of students who successfully complete Calculating Machines I. It is important to note that there are other performance requirements within this course, and that they will be reflected in the "intermediate" performance objectives included in the learning activities for the Calculating Machines program.

CALCULATING MACHINES I

8.1.0 FULL-KEYBOARD ADDING LISTING MACHINE: Given Instruction in [redacted] operating the Full-Keyboard Adding Listing Machine, the student will demonstrate mastery of this machine by completing a 40 item post-test with at least 60% accuracy within a 40 minute period.

8.1.1 The test will consist of problems involving:

1) Addition
2) Subtraction
3) Multiplication
4) Horizontal and Vertical Addition
5) Simple Discounting

8.1.2 The test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

8.3.0 TEN-KEY ADDING LISTING MACHINE: Given instruction in the touch method of operating the Ten-Key Adding Listing Machine, the student will demonstrate mastery of this machine by completing a 44 item post-test with at least 60% accuracy within a 40 minute period.

8.3.1 The test will consist of problems involving:

1) Addition
2) Subtraction
3) Multiplication
4) Division
5) Subtotaling
6) Simple Discounting
7) Addition of Fractions
8) Multiplication of Fractions
9) Completing Simple Invoices

8.3.2 The test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

8.4.0 ROTARY CALCULATOR: Given instruction in the operation of the Rotary Calculator, the student will demonstrate mastery of this machine by completing a 34 item post-test and a 46 item post-test with at least 60% accuracy within a 40 minute period on each test.

8.4.1 The 34 item test will be administered after the student has completed approximately half of the learning activities in this unit and will consist of problems involving:

1) Addition
2) Adding Constants
3) Subtraction
4) Subtracting Constants
5) Multiplication
6) Division
7) Accumulative Multiplication
8) Accumulative Total Solving
9) Repeated Addition
10) Completing Simple Invoices
11) Simple Discounting

8.4.2 The 46 item test will be administered after the student has completed all of the learning activities in this unit and will consist of problems involving:

1) Addition
2) Subtotal Key Use
3) Subtraction
4) Credit Balances
5) Multiplication
6) Multiplication of Fractions
7) Multiplication by Decimals
8) Multiplication Over a Fixed Decimal Point
9) Negative Multiplication
10) Accumulative Multiplication
11) Division, Whole Numbers
12) Division Over a Fixed Decimal Point
13) Percentage Calculation
14) Simple Discounting
15) Chain Discounting
16) Trade Discounting
17) Three-Factor Multiplication
18) Percent of Increase Calculation

8.4.3 Each test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

8.5.0 PRINTING CALCULATORS: Given instruction in the touch method of operating the Printing Calculator, the student will demonstrate mastery of this machine by completing a 33 item post-test and a 43 item post-test with at least 60% accuracy within a 40 minute period on each test.

8.5.1 The 33 item test will be administered after the student has completed approximately half of the learning activities in this unit and will consist of problems involving:

1) Addition
2) Repeated Addition
3) Subtraction
4) Credit Balance
5) Multiplication
6) Multiplication by Decimals
7) Accumulative Multiplication
8) Division
9) Decimals in Division
10) Three-Factor Multiplication
11) Adding Constants

8.5.2 The 43 item test will be administered after the student has completed all of the learning activities in this unit and will consist of problems involving:

1) Addition
2) Repeated Addition
3) Subtotal Key Use
4) Multiplication
5) Multiplication by Decimals
6) Multiplication of Fractions
7) Simple Discounting
8) Chain Discounting
9) Division
10) Decimals in Division
11) Percent of Increase or Decrease Calculation
12) Payroll Solving
13) Completing Simple Invoices
14) Fixed Decimal Point Addition

8.5.3 Each test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

ABSTRACT - Developed by business educators for use in teaching office machines, this document contains a series of tests for the second unit covering calculating machines. Designed to evaluate student performance in relation to stated terminal objectives, these tests cover: (1) the full-keyboard adding listing machine, (2) the key-driven calculator, (3) the ten-key adding listing machine, (4) the rotary calculator, and (5) the printing calculator. Also included is a suggested grading scale. Unit one is available as VT 012 221, also in this issue. (JS)

CALCULATING MACHINES 2

9.0.0 TERMINAL PERFORMANCE OBJECTIVES: The following objectives are a precise statement of the minimum performance required of students who successfully complete Calculating Machines 2. It is important to note that there are other performance requirements within this course, and that they will be reflected in the "intermediate" performance objectives included in the learning activities for the Calculating Machines 2 program.

CALCULATING MACHINES 2

9.1.0 FULL-KEYBOARD ADDING LISTING MACHINES: Given instruction in the operation of the Full-Keyboard Adding Listing Machine, the student will demonstrate mastery of this machine by completing a 39 item post-test with at least 60% accuracy within a 40-minute period.

9.1.1 The test will consist of problems involving:

1) Addition
2) Subtotal Key
3) Addition with Fractions
4) Repeated Addition
5) Subtraction & Credit Balance
6) Simple Percentages
7) Multiplication
8) Simple Discount & Net Amount
9) Division
10) Division (Decimals in Dividend & Divisor)
11) Crossfooting
12) Fixed Decimal Point Addition
13) Business Application Assignment (Credit Balance)

9.1.2 The test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

CALCULATING MACHINES 2

9.2.0 KEY-DRIVEN CALCULATOR: Given instruction in the touch method of operating the Key-Driven Calculator, the student will demonstrate mastery of this machine by completing a 43 item post-test with at least 60% accuracy within a 40-minute period.

9.2.1 The test will consist of problems involving:

1) Addition
2) Subtraction & Credit Balance
3) Multiplication
4) Multiplication (Decimals)
5) Division
6) Division (Trial-Division Method)
7) Multiplication (Cross-Hand Method)
8) Multiplication (Accumulation of Products)
9) Multiplication (Fixed Decimal)
10) Inventories (C, M, and CWT.)
11) Crossfooting
12) Multiplication (Fractions)

9.2.2 The test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

9.3.0 TEN-KEY ADDING LISTING MACHINE: Given instruction in the touch method of operating the Ten-Key Adding Listing Machine, the student will demonstrate a mastery of this machine by completing a 34 item post-test with at least 60% accuracy within a 40-minute period.

9.3.1 The test will consist of problems involving:

1) Addition
2) Repeated Addition
3) Subtraction
4) Subtraction (Credit Balances)
5) Multiplication
6) Multiplication (Decimals)
7) Multiplication (Fractions)
8) Subtotal

9.3.2 The test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

CALCULATING MACHINES 2

9.5.0 ROTARY CALCULATOR: Given instruction in the operation of the Rotary Calculator, the student will demonstrate mastery of this machine by completing a 42 item post-test and with at least 60% accuracy within a 40-minute period.

9.5.1 The 42-item test will be administered after the student has completed approximately half of the learning activities in this unit and will consist of problems involving·

1) Addition
2) Debit & Credit Balances
3) Subtraction (Credit Balance)
4) Multiplication
5) Multiplication (Fractions)
6) Multiplication (Decimals)
7) Division
8) Division (Decimals)
9) Accumulative Multiplication
10) Vertical & Horizontal Addition

9.5.2 The test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

9.8.0 PRINTING CALCULATOR: Given instruction in the touch method of operating the Printing Calculator, the student will demonstrate mastery of this machine by completing a 48 item post-test with at least 60% accuracy within a 40-minute period.

9.8.1 The 48 item post-test will be administered after the student has completed all of the learning activities in this unit and will consist of problems involving:

1) Addition
2) Multiplication (Decimals)
3) Multiplication (Fractions)
4) Division
5) Division (Decimals)
6) Percentage
7) Discount & Net Amount
8) Chain Discounts
9) Percentage (Increase or Decrease)
10) Markup or Markdown
11) Interest (Time)
12) Invoice (C)

9.8.2 Each test will be graded according to the following scale:

1) 90 - 100% = A
2) 80 - 89% = B
3) 70 - 79% = C
4) 60 - 69% = D

PREFACE

The Minnesota School Bus Driver's Handbook has been prepared and published by the Minnesota Department of Education and the Minnesota Highway Department for the purpose of providing school bus drivers and school officials with definite information relating to the safe and efficient transportation of pupils.

Every school bus driver applicant should become thoroughly familiar with all sections of this handbook. It will also serve as an excellent review for experienced drivers, and should be referred to frequently.

The written test will include questions on operating both the regular school buses and the smaller vehicles.

The professional school bus driver is charged with an important responsibility in transporting pupils to and from school. He is the guardian of the safety of the children whose lives are entrusted to his care.

Administrative Officers can offer a valuable assist to the drivers if, at the beginning of each school year, they arrange for the parents of the pupil-passengers to meet their driver and inspect the bus.

This type of meeting, in addition to being of interest to the parents, will give the driver an opportunity to learn something about the children and any peculiar problems which he may encounter in the coming year.

2855

An interesting side benefit is the effect such a meeting has on the children (who should not be present at the meeting). A child is usually much better behaved when he knows that the driver has met and talked with his parents.

This handbook is distributed without charge to all school bus drivers and those who are preparing to take the school bus driver examination. The handbook, application blanks and forms for physical examinations are also available from all motor vehicle registrars throughout Minnesota.

2856

GENERAL REQUIREMENTS

Except as otherwise noted, the following general requirements will apply to both the regular school buses and small vehicles. Regular school buses are those which carry 12 or more passengers. Small vehicles carry less than 12 passengers, and may be automobiles, station wagons, carryalls, or suburbans not over 10 years old.

License Requirements. A school bus driver's license examination shall be required of every person operating any motor vehicle used in the transportation of children to or from public, private or parochial schools and owned by:

1. A governmental agency; or
2. A person, firm, association or corporation; or
3. Private or parochial school, corporations or agencies.

Application for examination and license shall be in writing upon such forms and shall contain such information as the Secretary of State may prescribe, and shall be accompanied by the payment of an examination and license fee of $4.00. The fee for renewal of a school bus driver's license shall be $2.50.

The test or examination shall be a written test based upon the provisions of the Highway Traffic Regulations Act, rules and regulations relating to school bus operations prescribed by the State Board of Education, and a general knowledge of the operation of school buses.

School bus drivers' licenses shall be issued for the fiscal year ending on June 30 of each year.

Small Vehicle Driver Requirements. Drivers of small vehicles, including automobiles, station wagons, carryalls, or suburbans which carry 12 or less pupil-passengers must hold a current valid

2857

Minnesota school bus license when transporting children to and from school or on a school-related trip or activity.

Exception: A school bus driver's license is not required but the driver must hold a valid driver's license:

1. When transporting his own children to and from school under contract.
2. When operating **only a passenger automobile** or **station wagon** for an occasional school-related trip or activity (but not to and from school).

Physical Examination. The applicant for a school bus driver's license shall be in good physical and mental health, be able-bodied, and free from communicable disease. As evidence of his physical fitness and mental alertness the applicant shall submit to a physical examination upon initial application and each year upon renewal by reputable physicians designated by the local school authorities; and the licensed medical doctor's certificate of physical fitness shall accompany the application for school bus driver's license when presented to the Chauffeur's License Division. A physical examination may be required more often upon demand of any school district. Such extra examination shall be paid for by the district demanding it of any driver. A licensed school bus driver may also operate a motor vehicle as a chauffeur.

One or more of the following deficiencies will disqualify the applicant for a school bus driver's license:

1. Visual acuity less than 20/40 in either eye corrected. Total form fields of vision in the horizontal meridian of less than 140 degrees

2858

in either eye (with or without corrective lenses).

2. Hearing less than 10/20 in the better ear (with or without hearing aid).
3. Inebriates or users of narcotics.
4. Any indication of coronary or heart ailment likely to interfere with safe driving (electrocardiogram is required when other findings indicate desirability).
5. Blood pressure over 160/90.
6. Failure to have a satisfactory Mantoux or chest x-ray within the past six months.
7. Any communicable disease (as listed in Minnesota Health Department Regulations 10795 and 10812).
8. Loss of foot, leg, hand, arm or other structural defect or limitation of movement likely to interfere with safe driving.
9. Any mental, nervous, organic or functional disease likely to interfere with safe driving.
10. Diabetes unless controlled by diet only.
11. Epilepsy or other episodic (paroxysmal) periods of unconsciousness.
12. Use of any medication which the examining physician determines is likely to interfere with safe driving.
13. Applicant not of good general health.

The certificate to be used by the physician for reporting the physical condition of the applicant shall be one prescribed by the Secretary of State and may be obtained from the Chauffeur's Section, Motor Vehicle Division, or from any authorized Deputy Motor Vehicle Division or from any authorized Deputy Motor Vehicle Registrar throughout the state.

Character. The driver shall be of good moral character and conduct himself in such a manner as to exercise good influence over the pupils.

Experience. Regardless of prior driving experience it is recommended that all school bus drivers, before transporting pupils, receive adequate basic instruction for the operation of a school bus, including a performance test in the vehicle. It is also recommended that all school bus drivers take the eight-hour National Safety Council Defensive Driving Course and the Medical Self Help Course (Dept. of Health).

Age. The driver shall be at least 18 years of age and have a good driving record. No maximum age is set by law; however, some school districts or private contractors may have a mandatory retirement age.

2860

CONTRACT PROVISIONS — DRIVER OBLIGATIONS

Contracts: The contract form as prepared by the State Board of Education and approved by the State Attorney General contains provisions which must be observed by the school bus driver.

The driver must agree to faithfully fulfill the following general obligations and such special duties as may be added to the contract by both parties:

1. To travel over the route and make stops according to the timetable designated by the School Board and/or Administrative Officer.
2. To keep the conveyance and other property used in transporting pupils clean and under shelter at all times when not in actual use and to exercise reasonable care in the use of such equipment.
3. To use the bus and all other property for no other purpose than the transportation of pupils over routes designated without special permission from the School Board and/or Administrative Officer.
4. To allow no other person to drive the vehicle without the proper license and without special permission from the School Board and/or Administrative Officer.
5. To exercise the utmost care in protecting children from injury or exposure.
6. To stop the bus at all railroad crossings. (Railroad crossings are only to be flagged when designated by the Administrative Officer.)
7. To supervise the safety of pupils when they cross the highway before entering or leaving the school bus.

2861

8. To be alert and observe all laws and rules relating to travel on the public roads.

9. To observe all operating rules adopted by the State Board of Education, Commissioner of Highways, and local School Board.

10. To maintain order among the pupils at all times; to allow them to enter and to leave the bus only at pupil station stops designated by the Administrative Officer; and to report all cases of disobedience, improper conduct, speech and cases of tardiness to the Administrative Officer.

11. To use no profane or indecent language within hearing of the pupils and to tolerate none from them.

12. To abstain from the use of tobacco when driving the bus and allow no children to use tobacco in any form.

13. To abstain absolutely from the use of intoxicating beverages on days when he transports children.

14. To make such daily and weekly reports to the Administrative Officer as shall be required, and other reports to the designated authorities.

15. To attend all meetings of school bus drivers called by the Superintendent or Administrative Officer.

16. To attend one county or regional school bus driver's school of instruction, and to bring the vehicle used for transportation of pupils for inspection to the county school bus clinics when such meetings are called by the State Department of Education.

17. To post a copy of the "School Bus Passenger's Pledge" in the bus so that it can be read and referred to by all pupils.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

GENERAL OPERATING RULES

1. Only pupils assigned to the school bus by the School Board or designated Administrative Officer of the school district shall be transported at district expense. The number of pupils or other authorized passengers transported in or assigned to a school bus shall not be more than the number of pupils or passengers that can be seated, and no person shall stand when the bus is in motion.

2. Pupils are not to be evicted from the bus along the route for a breach of discipline; all such breaches shall be reported by the bus driver to the Administrative Officer. (Discipline in the bus is the responsibility of the driver).

3. Safety drills for the pupil-passengers, using the entrance door and the emergency exit door on large buses, shall be conducted at least twice a year by the driver under the supervision of the Administrative Officer.

4. The Administrative Officer shall see that no materials including: guns, loaded or unloaded; gasoline cans, empty or full; animals or any other object of a dangerous or objectionable nature are transported in the school bus when children are being conveyed.

5. Immediate report of all accidents, however slight, involving the school bus shall be made by the driver to the Administrative Officer and to such other authorities as required by law, rule or regulation. The driver shall prepare and keep all records and reports required by the Administrative Officer.

6. There shall be no pupils in the bus while the gas tank is being filled. On leaving the vehicle, when children are in the bus, the driver shall stop the bus, remove the ignition key, set the brakes and otherwise render the bus immobile.

2863

7. Buses shall not be run backwards on the school grounds or any other point if it can be avoided. If it is necessary to run a bus backwards, the driver shall have another responsible person act as a guard flagman in back of the bus to keep other persons out of the path and to issue warnings to the drivers of approaching traffic.

8. When arriving or leaving the school grounds, the driver must not travel closer than 50 feet to the bus directly in front of him nor closer than 500 feet when traveling on the highway (this rule applies to the large buses only).

9. No school bus shall pull any trailer when children are being transported to or from school or on extracurricular trips.

10. In case of an accident or breakdown of the bus, the driver shall not leave the bus but send two of the patrol boys or other responsible pupils to the nearest house to summon help.

11. The School Board may adopt such additional operating rules as deemed necessary to meet local conditions and needs, provided they do not conflict with state laws and regulations.

SPEED LIMITS, SEATBELTS, LIGHTED HEADLAMPS AND RAILROAD CROSSINGS

Speed Limits: The driver shall not exceed the speed of 50 miles per hour on a regular school bus route to or from school.

1. The driver will not exceed the posted speed limits on extracurricular trips.
2. He will never drive at a speed that is faster than reasonable under existing conditions. (Never operate any school bus improperly equipped or in an unsafe condition).

2864

Seatbelts: All school bus drivers shall be required to use the driver seatbelt at all times when the vehicle is so equipped.

Lighted Headlamps: The driver shall display lighted headlamps (low beam) during daylight hours when transporting children.

Railroad Crossings: All school buses, whether carrying passengers or not, are required to stop at all railroad crossings when the school bus sign is displayed on the vehicle. Red flashing stop signals or alternately flashing amber signals shall not be used at railroad crossings. (It is recommended that flashing amber four-way hazard warning signals be used). A school bus shall not be flagged across railroad grade crossings except at such crossings as the local school Administrative Officer may designate. At such crossings, at least a sixth grade student shall flag the school bus across the railroad tracks (see page 21 for proper procedures). The driver must be sure that the pupil has checked for approaching trains before driving across the tracks.

LOADING OR UNLOADING

1. Never load or unload pupils where the view is obstructed to other motorists for 500 feet in either direction.

2. Never permit pupils to get up from their seats or get on or off the bus while it is in motion.

3. Bring the bus to a full stop and disengage gears by shifting gear shift lever into neutral position or selector into neutral or park position before loading or unloading pupils.

4. Regular buses shall load and unload in the right lane of the roadway and only at pupil stations designated by the Administrative Officer on approved bus routes. In no event shall buses load

2865

or unload pupils in a **DESIGNATED TURN LANE** or in a lane immediately adjacent to a **DESIGNATED TURN LANE.**

5. Small vehicles shall not stop in the right lane to load or unload pupils, but clear of the main traveled portion of the roadway.

6. For small vehicles, pupils shall load or unload only from the right hand side of the vehicle, except on a one-way street, where the nontraffic side of the vehicle may be used.

USE OF SIGNALS, LOADING OR UNLOADING
(Regular Buses)

1. The driver shall actuate the flashing red signals of the bus at least 300 feet before stopping to load or unload pupils when outside an incorporated municipality, and 100 feet when operating within an incorporated municipality, and shall not extinguish such lights until loading or unloading is completed and persons who must cross the highway are safely across.

2. Bring the vehicle to a complete stop in the right hand lane of the roadway parallel to the centerline.

3. Extend the stop signal arm upon stopping and continue to activate the flashing red signals.

4. Open door to discharge pupils only after all traffic (front and rear) has come to a complete stop.

5. Keep stop signal arm extended until all pupils have been loaded or unloaded safely or have crossed the road.

6. Keep flashing red signals activated until loading or unloading of pupils has been safely completed, stop arm retracted and bus in motion.

2866

2867

STOP SIGNALS NOT USED

The driver shall **not** use stop signals in the following:

1. In special school bus loading areas where the bus is entirely off the traveled portion of the road.
2. In residence or business districts of cities, villages, or boroughs, except when directed by the school Administrative Officer. (Examples: narrow 2-lane roadway, roadway obstructed, or where school bus must stop in the traveled lanes of roadway.)
3. When a school bus is being used for other purposes; such as charter service (in which event, the school bus signs, front and rear, must be removed or completely concealed).

EQUIPMENT FOR SMALL VEHICLES

Reflectorized school bus sign required — To comply with standards set by the Commissioner of Highways.

Sign used — the school bus sign shall be displayed (front and rear) at all times when the vehicle is in use as a school bus.

Sign not used — the school bus sign shall **not** be displayed when the vehicle is not in use as a school bus.

Alternately flashing amber signals required — to comply with standards set by the Commissioner of Highways.

Amber signals required and used:

1. The driver will signal his intention to stop by activating the alternately flashing amber signals (only when operating outside city limits).

2868

2. He will keep alternately flashing amber signals activated until loading or unloading of pupils has been safely completed and the vehicle is in motion (only when operating outside city limits).

Alternately flashing amber signals not required or used — vehicles transporting school children to and from school operating within an incorporated municipality (only reflectorized school bus sign is required).

DRIVER RESPONSIBILITY

For Regular Buses: The driver shall be responsible for safely delivering the pupils who must cross the highway by one of the following methods:

1. Pupils shall pass approximately 10 feet in front of the school bus so as to be seen by the driver and cross the road only upon receiving word from the driver, or
2. The pupil shall pass approximately 10 feet in front of the bus so as to be seen by the driver and be conducted across the road by the School Bus Patrol, or
3. The driver shall personally conduct the pupils across the road.
4. The driver shall visually ascertain that alighting children not crossing the road shall be a safe distance from the bus before moving the vehicle.

For Small Vehicles: He should load or unload, except where impractical, where the child need not have to cross the road.

When a child **must** cross the road, it is the responsibility of the driver to escort him across, after first:

(a) Stopping the motor

2869

(b) Removing the ignition key

(c) Setting the brakes

(d) Otherwise rendering the vehicle immobile.

REPORTS

The driver shall make the following reports:

1. Daily or weekly reports as requested by the Superintendent.
2. He must report all accidents, however slight, to the Superintendent, who in turn shall complete the school bus accident report and transmit to the Department of Education.
3. He must report all accidents involving personal injury or death, and/or property damage of $100 or more to the State Commissioner of Highways (this is in addition to the report required by the Department of Education).
4. All discipline cases shall be reported to the Superintendent.
5. Time schedules shall be posted in buses, together with a list of assigned pupil riders.

2870

SCHOOL BUS PATROL

1. The organization and use of a School Bus Patrol is recommended to assist the bus driver in the safe operation of the vehicle. These patrols can be very helpful in maintaining order and preventing accidents on buses and in assisting pupils safely across highways.

2. School Safety Patrols for buses should be appointed, organized and governed in the same manner as regular School Safety Patrols.

The school bus driver should be present at the organization of the School Bus Safety Patrol and should be familiar with all rules and regulations governing the duties of Patrol members.

When it appears that the Patrol member is having difficulty carrying out his duties, the driver shall promptly give necessary assistance. The driver shall maintain supervision over the School Bus Safety Patrol. He is responsible for the safety of the pupils, and the presence of a School Safety Patrol member in no way relieves him from such responsibility.

When selecting members for a School Bus Safety Patrol, personality, strength and physical size should be taken into consideration. Alternates should be appointed to serve on days when Patrol members are absent, before the regular Patrol member enters the bus or after he leaves the bus near his home. There should be two regular members of the School Safety Patrol for each bus — one in the rear of the bus near the emergency door and the other to supervise the operation of the regular entrance door and perform other duties that may be assigned to his position.

3. The duties of the School Bus Safety Patrol are:

(a) To supervise loading and unloading of the pupils in an orderly and safe man-

2871

ner. Pupils should enter and leave the bus in single file.

(b) To see that all pupils are provided with a seat and are seated before the bus leaves the school grounds.

(c) To prevent pupils from getting on or off when the bus is in motion.

(d) To prevent pupils from moving around while the bus is in motion.

(e) To assist the bus driver in checking attendance.

(f) To keep aisles free of books, lunch buckets, etc.

(g) To prevent pupils from tampering with emergency door or other safety devices.

(h) To prevent pupils from putting their hands, arms, heads or bodies out of the windows.

(i) To flag the bus across railroad tracks in the following manner:

(1) The Patrol shall take position as to have a clear view of the railroad tracks in both directions.

(2) If a train is approaching the crossing, the Patrol member shall not cross the tracks but shall face the bus at a safe distance from the tracks and give the signal for the bus to not proceed by holding up both hands above his head.

(3) If the track is clear and safe for crossing, he shall signal with a forward motion of his upraised arm (after proceeding across the tracks)

2872

for the driver to proceed across the tracks to a point at least two and a half bus lengths beyond the tracks where the pupil shall re-enter the bus.

(j) Direct pupils across the roadway after alighting from the bus in the following manner:

(1) The Patrol member shall lead the pupils to a position approximately 10 feet in front of the bus so they can be seen by the driver where he shall hold them in readiness to cross until it is safe to permit them to do so. Crossing the highway behind buses shall never be permitted.

(2) The Patrol member shall not escort each pupil across the highway but shall remain at his post near the front of the bus.

(k) Call the driver's attention to hangers-on or persons attempting to get a ride on the outside of the bus.

(l) Follow the directions of the driver and assist him in case of accident or other emergency. In case the driver is seriously injured, the Patrol member shall follow emergency procedures previously agreed upon to safeguard the children in the bus. He should know emergency procedures and telephone locations.

(m) Assist in maintaining discipline and order on the bus.

4. School Bus Safety Patrols should also be used during extracurricular activities involving

2873

use of the bus and school children. A well-organized School Bus Safety Patrol is a great assistance in the safe transportation of pupils.

EMERGENCY DRILLS

Due to the increased number of pupils being transported in the present day traffic with a potential increase in accident hazards, it is suggested that an emergency drill be practiced regularly by all pupils transported to the school by motor vehicles.

1. Emergency drills for school buses should be organized in a manner similar to the fire drills held regularly in school. The children should be taught to vacate a school bus quickly and in an orderly fashion in case of an emergency.

2. The bus driver is responsible for the safety of the pupils. However, in an emergency, the driver might be incapacitated so that he would not be able to evacuate the children. Therefore, school Safety Patrol members or other designated pupils should be used to direct these drills. It is extremely important to have regular substitutes so that leaders will always be available.

3. Emergency drills should be held regularly, at least twice a year or perhaps more often during the fall and spring months; and preferably when the loaded bus arrives at the school building.

4. The bus driver shall direct the emergency drill. When the bus arrives at the school, the drill will be conducted by one of the following methods:

   (a) Everyone exits through the rear emergency door.

2874

(b) Everyone exits through the front entrance door.

(c) The front half exits through the front entrance door and the rear half exits through the rear emergency exit door.

5. The pupils should go to a distance of at least 100 feet from the bus in an emergency drill and remain there in a group until given further directions by the leader.

2875

VEHICLE INSPECTION

Before starting his day's work, the driver should inspect his vehicle. Waiting until the bus is in motion or pupils are loaded could be too late and extremely hazardous.

The following daily inspection is recommended:

CHECK: (Prior to starting vehicle)

a. Tire pressures
b. Water in radiator
c. Gasoline
d. Oil in crankcase
e. All lights, for operation and cleanness
f. Horn
g. Rear-vision mirrors
h. Windshields and all windows for cleanness
i. Signal arm
j. Equipment, such as flags and flares, first aid kit, winter emergency equipment, fire extinguisher
k. Operation of front door and emergency door

(After starting the engine)

a. Oil gauge
b. Water temperature
c. Windshield wiper
d. Peculiar engine noises
e. Ammeter
f. Heater and defrosters

(Weekly)

a. Tire inflation (with gauge)
b. Battery
c. Anti-freeze in radiator
d. Condition of hoses and belts
e. Tires for cuts, imbedded stones, or sign of wear
f. Exhaust system

2876

TIPS ON HANDLING CHILDREN

1. Show the children that you love them. Look for the good qualities — all children have them.

2. Never give an order you do not mean to enforce.

3. Do not punish the whole bus load for the behavior of one rider.

4. Let the pupils sit with their friends, if possible.

5. Learn the children's names and greet them each morning and evening.

6. Show a sense of humor, but be able to control it.

7. Remember that you are dealing with children, not adults.

8. Show an interest in the children and their school.

9. Answer any questions that may be asked sensibly and intelligently.

10. If you have problems with the riders, try to solve them without going to school authorities or parents.

11. Ask all students to read the School Bus Passenger's Pledge. Explain that you also have many responsibilities toward them.

12. Listen to suggestions.

13. Set a good example by your conduct, dress, and by living up to the "rules of the road".

14. The safety and well-being of your passengers is your responsibility. Put your heart into it.

15. Be patient. It takes a lot of patience when there is a large group of healthy, lively youngsters.

2876

2877

SCHOOL BUS PASSENGER'S PLEDGE

1. I always walk single file on the left side of the highway facing traffic, when there are no sidewalks.

2. I do not play games on the street or highway while waiting for the school bus.

3. I start to school in time so that I'm always on time for the school bus.

4. I never ask for or accept rides from strangers.

5. I always wait for the bus to come to a full stop before I attempt to get on the bus, or before I get up from my seat to leave the bus.

6. I go immediately to my seat and stay there until the bus comes to a complete halt at my assigned stop or at the school.

7. I do not put books, lunch, or anything in the aisles of the bus; and I do not leave wrappers or other waste on the bus when I get off.

8. I never tamper with the bus or with any of its equipment.

9. I never tamper with the windows; I never put my hands, arms, legs or any part of my body out of the windows.

10. I always observe classroom conduct in the bus.

11. I do not talk with the driver while the bus is in motion.

12. I report immediately to the driver any damages to the bus.

13. I am always a courteous traveler.

2878

14. I always obey and cooperate with the driver and the school bus patrol members.

15. I leave the bus at other than my assigned stop only with the consent of the school authorities and the driver.

16. When I get off the bus to cross the road, I always cross 10 feet in front of the bus so I can be seen by the driver.

17. I cross the street or highway only when the driver or school bus patrol has signalled that the way is clear, and I have looked carefully in both directions. I always walk, not run across the road.

PUB DATE - 69 59p.

DESCRIPTORS - *HEALTH OCCUPATIONS EDUCATION; *TEACHING GUIDES; *COOKS; FOOD SERVICE WORKERS; NUTRITION INSTRUCTION; FOODS INSTRUCTION; *NURSING HOMES; PRETESTING; *STAFF IMPROVEMENT

ABSTRACT - This 16-week course was developed by the Chicago Board of Education and the Joint Board for Long-Term Care to aid teachers in upgrading cooks in nursing homes and other long-term care facilities. Students are selected by the cooperating agency and must have been employed in a nursing home for at least 6 months. Pretests are given to determine a student's reading and ability level and his knowledge of cooking skills, followed by instruction in these units: (1) Introduction, (2) Fundamentals of Nutrition, (3) Principles of Food Preparation and Service, (4) Therapeutic Diets, (5) Environmental Control, and (6) Techniques of Ordering and Inventory Control. Objectives, concepts, content, and activities are included with each unit, and instructional and resource materials are appended. (SB)

FOREWORD

The curriculum guide for use in the Short-Term Course for Cooks in Long-Term-Care Facilities was developed to assist teachers working with cooks in nursing homes and other long-term facilities.

Food is a very important part of the physical and psychological well-being of patients in these institutions. This guide takes into consideration the fact that the people responsible for the food services in these facilities sometimes have limited preparation for their jobs.

Efforts to improve food services for the increasing number of people needing long-term care should result in improved nutrition for the patients and increased job satisfaction for the cook employees.

INTRODUCTION

The Short-Term Course for Cooks in Long-Term-Care Facilities is a cooperative effort of the Chicago Board of Education and the Joint Board for Long-Term Care to upgrade the person working as a cook in the Chicago area nursing homes and other long-term-care facilities. This course is one phase of a demonstration project in health occupation which was funded by the Research Coordinating Unit of the State of Illinois Department of Vocational Education and Rehabilitation. An advisory committee is composed of representatives from the community.

The prospective student for the program is selected by the cooperating agency. The requirements for the student include successful employment in a nursing home for at least six months. A pretest to determine the student's reading and ability level is given for guidance purposes in teaching. Another pretest is given to the student to determine her knowledge of cooking skills.

The information gleaned from the pretesting of students and the task analysis of the food service job provided much of the substance for the guide.

The program is twofold, challenging the ability of the student to follow directions and to improvise while she is cooking in her place of employment. Evidence of this is evaluated in the final cooking practicum. At the completion of the program, the pretest is repeated as a retest to measure and evaluate the results of the student's understanding of cooking principles.

Because of the distance between participating nursing homes, the average student load has been set at 15. The length of the course is 16 weeks and consists of one formal three-hour class a week, which includes lectures, demonstrations, and illustrative materials.

A follow-up study three months after completion of the first class indicated that all the students who completed the course were still employed in the same job. Plans include a continuation of follow-up studies to determine behavorial changes occurring in the student and the length of time the employee stays on her job after completion of the course.

Adaptability of the teacher is of paramount importance because of the necessity for frequent improvising while teaching in this program. Formal classes are sometimes held in ill-equipped classrooms and the laboratory demonstrations are performed in inadequately supplied kitchens in the various settings of the nursing homes. The teacher cooperates with the nursing home administration to provide an in-service education and, when necessary, to recommend ways of improving food service.

OBJECTIVES

General

To apply proper methods to food preparation and service for the improvement of the food service in long-term-care facilities

Contributing

To gain an understanding of the duties and responsibilities of the job as related to the care of the geriatric patients

To develop an ability to recognize quality foods

To learn the correct techniques and an understanding of the basic principles necessary to produce and serve quality foods

To acquire the ability to establish and maintain good personal relationships with co-workers and patients

To develop self-confidence by increasing job satisfaction and personal growth.

SHORT-TERM COURSE FOR COOKS IN LONG-TERM-CARE FACILITIES

UNIT I: INTRODUCTION

CONCEPTS	CONTENT
Satisfactory achievement of the goals of the geriatric cook program is dependent upon the student-learner's understanding of the requirements and the operation of the program.	A. Introduction of personnel 1. Classroom teacher 2. Fellow students in the class 3. Supervisory personnel a. Program b. Facility
Introduction of the students to the teacher, the classmates, and other personnel helps to promote a desirable learning atmosphere.	
The understanding of the nature of the geriatric cook program contributes to the development of student co-operation.	B. Description of course 1. Origin of program 2. Purpose 3. Qualifications for certification 4. Content 5. Length 6. Pretest-retest 7. Methods of teaching a. Classroom b. Laboratory c. Individual guidance 8. Evaluation a. Classroom performance (by teacher) b. Practicum (by teacher representatives from nursing homes, Chicago Board of Education, and Chicago Board of Health)

ACTIVITIES

A. Introduction of Personnel

Tell the teacher's name and write it on the chalkboard.

Ask each student to stand and introduce himself.

Ask each student to tell where he is employed and to describe the nursing home in which he works.

B. Description of Course

Use simple language. Explain new terms. Encourage student participation and pause for student questions and discussion.

Have the students describe their expectations of the course.

Point out the need for well-trained cooks and explain the benefits of the course. (See Appendix for "Qualifications for Certification.")

Explain the following aspects of the program:

history
functions of the advisory committee
structure.

Explain the student responsibilities in the program.

Explain the teacher's role in counseling students. Emphasize that the students should feel free to seek guidance from the teacher.

Review the evaluation procedures that will be used. (See Appendix for the forms "Cook-Trainee Evaluation" and "Cook-Trainee Practicum Evaluation.")

Prepare a class schedule and give a copy to each student.

Instruct each student to get a looseleaf notebook (8 1/2" x 11") to bring to each class. Explain that this is to be used for student handouts and for class assignments.

Explain the purpose of the pretest and administer it to the students.

CONCEPTS	CONTENT
In order for any institution to operate efficiently, all employees need to understand and adhere to the rules and regulations that govern the institution.	C. Regulations 1. Attendance a. Absenteeism b. Tardiness
Safe food preparation and a feeling of self-esteem result from excellent performance on the job and understanding of desirable personal guidelines for cook performance.	D. Guidelines for a cook's performance 1. Basic health and safety a. Clean environment b. Safe environment 2. Personal appearance 3. Personal health habits a. Handwashing b. Other health habits 4. Behavior a. Good manners b. Inappropriate behavior

ACTIVITIES

C. Regulations

Discuss the importance of being on time, both at work and for class. Explain the controls which are in the program to combat excessive absence and tardiness.

Have the students tell about situations in which tardiness or absence has hindered them in the past.

Conduct discussions of the following questions:

Why is it important not to work with foods if you have a cold or a contagious disease?

Why are cooks not permitted to smoke while working in the kitchen?

What should you do if you have a sore or cut on your finger?

Why is there a regulation that every kitchen employee have a chest X ray, stool specimen, and blood test prior to employment and then periodically during employment?

Who is responsible for enforcing the regulations?

D. Guidelines for a Cook's Performance

Develop with the students a list of desirable work habits, such as reporting to work on time and being well-groomed.

Have the student identify the procedures necessary for maintaining a clean and/or safe environment.

Ask the students to give examples of desirable personal cleanliness traits. Write the traits on the chalkboard or ask a student to do so.

Call upon the students to give examples of good and poor personal habits of workers who handle food.

Ask the student to explain why a worker's failure to cover his mouth when he coughs or sneezes and his failure to wash his hands after touching his hair or handkerchief are objectionable to others and can contaminate food.

Lead a general discussion with the students to investigate the importance of such habits as dependability, courtesy, and promptness.

Demonstrate the proper procedure for washing the hands. Have the students practice the procedure.

CONCEPTS	CONTENT
Improved ability to work harmoniously with others results in personal growth and satisfaction.	E. Interpersonal relations 1. Co-workers 2. Patients 3. Consultants

ACTIVITIES

Have students rehearse hygienic work procedures in preparation for working with food, such as preparing a clean work surface.

Ask a student to describe a well-groomed look. Follow the description with a student uniform inspection. Use a good grooming poster as a uniform checklist for cooks.

E. Interpersonal Relations

Ask the students to make suggestions for ways of improving one's relations with others. Write the suggestions which the class decides are useful on the chalkboard, or ask a student to do so.

Ask the students to point out personal characteristics which they like in others.

Show appropriate films and filmstrips to enrich the student's understanding of specific concepts in the unit. Before a film presentation, prepare the students to look for the pertinent facts which are shown in the film or filmstrip. Follow each film presentation with a general discussion.

SHORT-TERM COURSE FOR COOKS IN LONG-TERM-CARE FACILITIES

UNIT II: FUNDAMENTALS OF NUTRITION

CONCEPTS	CONTENT
A study of nutrition will assist the employee in a health facility to understand various aspects of his vocation and to provide improved food service to patients.	A. Nutrients and their effect on the body
Foods supply living things with energy, the raw materials for growth and repair of tissues, and protective chemicals for the sustenance of life.	1. Definition of nutrition (Nutrition is the act or process by which living things take in food and use it.)
A knowledge of foods and nutrition will help the student move towards personal and family health and possibly overcome defects caused by poor nutrition.	2. Relation of nutrition to good health a. Personal b. Family c. Patient
	3. Characteristics of good nutrition

2896

ACTIVITIES

A. Nutrients and Their Effect on the Body

Have the students discuss the following questions:

What determines your choice of foods or snacks?
What part do food habits play in your choice of foods?
What part do favorite foods play in your choice of foods?

Ask the students to explain the sentence "You are what you eat" by identifying the kind of person it fits, such as the person who consumes too many calories and is therefore overweight.

Ask the students to list some physical characteristics that may be caused by an inadequate diet, such as dry skin or soft, broken fingernails.

Have the students give examples of some eating habits which contribute toward good nutrition, such as the eating of three well-balanced meals a day, and some poor eating habits, such as eating between meals or having a bedtime snack of pastries.

Discuss with the students the mental and emotional effects on an individual resulting from poor nutrition, such as low energy, dull expression, chronic fatigue, and lack of patience.

Ask the students to make a list of what they could do to improve their own eating habits, for example: Always eat a well-balanced breakfast.

Have the students bring pictures of well and poorly nourished individuals and display the pictures on the flannel board. Conduct a general discussion by having the students identify the characteristics of each.

CONCEPTS	CONTENT
Foods contain useful substances called nutrients.	B. Nutrients
An adequate diet will include the necessary nutrients in sufficient quantity and be balanced to provide optimum health.	1. Carbohydrates 2. Proteins 3. Fats 4. Vitamins 5. Minerals 6. Water
A properly balanced diet contains foods from the milk, meat, vegetable-fruit, and the bread-cereal groups.	C. The basic four food groups 1. Milk 2. Meat 3. Vegetable-fruit 4. Bread-cereal

ACTIVITIES

B. Nutrients

Have the student name five nutrients. Write them on the chalkboard or request a student to do so.

Discuss the meaning of the terms complete protein and incomplete protein.

Have the students name ten foods that are complete proteins and two that are incomplete proteins.

Ask the students to list a typical day's supply of the foods that contain the following:

fats
carbohydrates--identifying which are sugars and which are starches

vitamins
minerals.

Discuss the function of each of the above foods in the body.

Have the students list four foods that are a good source of each of the following:

vitamin C
vitamin A
calcium
riboflavin.

C. The Basic Four Food Groups

Ask each student to list ten foods that he enjoys eating and identify the food group to which each belongs. Point out and discuss the caloric content of each food.

Have each student plan a balanced menu for a day using pictures to illustrate it. Ask the students to display the pictures on the flannel board and explain to which food group each food belongs.

Have each student prepare a notebook about the basic four food groups, using picture illustrations of each group.

Ask the students to list ways to include milk in the diet other than as a beverage.

CONCEPTS	CONTENT
Different people use up varying amounts of heat energy depending upon the age, height, weight, and the kind and amount of physical activity in which each individual engages.	D. Calories 1. Energy requirements 2. Measurement

2900 2983

ACTIVITIES

D. Calories

As each student tells what he had for breakfast that morning, list the items on the chalkboard or place pictures of them on the flannel board. Keep the list or the pictures in view while the class evaluates the student's breakfast.

Explain to the students how the energy supplied by food can be measured in terms of the amount of heat given off when the food is burned and that this heat energy is measured in terms of heat units called calories.

Request each student to keep a record for three days of the foods, including snacks, which he eats. List the foods on the chalkboard and have each student figure out the number of calories he has consumed in the three days. Have him compare this total with the desired caloric intake for a person of his particular size.

Ask the students to list some foods that could be used for snacks between meals and that would not add many calories to the day's intake.

Compare for the students the caloric values of the following pairs of foods by writing the values on the chalkboard:

chocolate cake	---	carrot sticks
apple pie	---	celery
chocolate eclair	---	apple

SHORT-TERM COURSE FOR COOKS IN LONG-TERM-CARE FACILITIES

UNIT III: PRINCIPLES OF FOOD PREPARATION AND SERVICE

CONCEPTS	CONTENT
A knowledge of the basic principles of food preparation and service is a necessary qualification for the geriatric cook whose responsibility is to prepare and serve nutritionally adequate and attractive meals in an institution.	A. Preparation 1. Institutional equipment a. Use b. Care c Safety precautions required
The correct use and care of suitable cooking equipment are necessary for the proper preparation and servicing of food.	

ACTIVITIES

A. Preparation

Plan a class field trip to the restaurant show when it is in the city.

Demonstrate the common small equipment essential for proper preparation of foods, by showing actual examples and pictures of such items as the following:

knives	tongs
pastry blenders	rolling pin
mincer	pastry brush
chopper	measuring cups
egg beater	measuring spoons
pancake turner	mixing bowls

Have each student compile a list of the small kitchen equipment that he feels is most useful in his place of employment.

Demonstrate the proper use and care of electrical equipment, such as the toaster, mixer, blender, meat slicer, and chopper.

Discuss the safety procedures which are important in the kitchen in the prevention of accidents, including the following:

proper handling of hot containers
proper use and storage of knives
disconnecting of electrical equipment before cleaning
cleaning up of spilled fluids or foods immediately
alertness to defective glass and china and their disposal.

CONCEPTS	CONTENT
The knowledge and use of standardized recipes are necessary to assure a quality product.	2. Use of recipes a. Measurements b. Standardization of recipes

ACTIVITIES

Hand out "Table of Measurements" to students. (See Appendix.) Conduct a demonstration of liquid and dry measurements as follows:

Dry measurements, using flour, sugar (granulated and brown), baking powder, and salt. Measure 1/2 T., 1/8 t., 1/3 cup, 3/4 cup.

Liquid measurements, using water. Measure 1/4 teaspoon, 1 tablespoon, 2/3 cup, 1/4 cup, 1 1/2 cups.

Hold a session for the students to practice making liquid and dry measurements. Ask each student to bring liquid and dry measurement cups and measuring spoons to class.

Follow the measurement practice session with an oral or written quiz on measurements. (The choice depends on the ability level of the students.)

Schedule a practice session for students to increase and decrease such recipes as the following:

Jeweled Rice Pudding

Servings	25	50	100
Fruit cocktail	1/2-#10 can	1-#10 can	2-#10 cans
Orange juice	1/4 C.	1/2 C.	1 C.
Water as needed to make	1 qt.	1/2 gal.	1 gal.
Rice, dry	2 C.	4 C.	8 C.
Salt	2 t.	4 t.	2 T. + 2 t.
Butter or margarine	2 T.	1/4 C.	1/2 C.
Sweetened whipped topping	1/2 gal.	1 gal.	2 gal.

Procedure:

1. Drain fruit cocktail, saving syrup.
2. Add orange juice and water to syrup to measure amount as given above.
3. Add rice, salt, and butter or margarine to syrup-water-juice mixture. Bring to boil, reduce heat, and simmer until all liquid is absorbed and rice is tender.
4. Fold rice and fruit cocktail into topping; chill.

Follow up the increasing and decreasing of recipes with practice sessions in the classroom and then individually in the nursing home kitchen settings.

CONCEPTS	CONTENT
When scientific principles are applied to food preparation, the nutritive value, flavor, color, and texture are preserved. Milk is known as the "almost perfect food," because it contains more of the nutrients needed by the body than any other food, and it can be used in a great variety of ways in all food categories.	B. Principles of cookery 1. Milk and cheese a. Nutritional value b. Use c. Kinds d. Storage
Meats, eggs, poultry, and fish are excellent sources of complete protein, which are best preserved by low temperature cooking	2. Meat, eggs, poultry, and fish a. Beef, lamb, pork, veal Nutritional value Methods of cooking Kinds Storage b. Eggs Nutritional value Methods of cooking Kinds Storage

ACTIVITIES

B. Principles of Cookery

Have the students collect pictures of various kinds of cheese for a display on the bulletin board.

Ask the students to use milk and milk products in the preparation of new menu items that may be used in each nursing home.

Have small groups of students prepare assorted cheese trays.

Ask each student to write two menus, using cheese as the main entree.

Discuss the importance of the following aspects of milk storage:

cleaning bottles
placing bottles in coldest place in refrigerator
keeping milk in refrigerator at all times when not in use
preventing absorption of odors
avoiding the mixing of old and new milk.

Ask the students to identify retail cuts of beef, lamb, pork, and veal on a meat chart.

Have the students bring to class four recipes which use ground beef in ways other than with spaghetti, in meat loaf, and chili.

Explain the dry and moist heat methods of cooking meats. Ask the students to give examples of each.

Conduct a demonstration to show the characteristics of the various grades of eggs.

Demonstrate the procedure of beating egg whites at room temperature and then chilling.

CONCEPTS	CONTENT
	c. Poultry Nutritional value Kinds Methods of cooking d. Fish Nutritional value Kinds Methods of cooking
The main principle in vegetable and fruit cookery is to cook only until tender in order to preserve nutritive value, color, flavor, and texture.	3. Vegetables and fruits a. Role of vegetables and fruits in menu planning b. Nutritional values c. Types: fresh, canned, frozen, dried d. Criteria for buying e. Uses f. Storage g. Salads h. Dressings Kinds Preparation Use i. Garnishes

2907

ACTIVITIES

Explain the importance of the following aspects of meat storage:

covering fresh meats with wax paper and leaving the ends open

storing ground meats, stew meats, and variety meats for NOT more than 24 hours

placing frozen meats in the freezer as soon as they arrive

wrapping cooked meat for storage.

Conduct a follow-up with each student in her place of employment on the following methods of preparation: roasting, braising, stewing, and frying.

Point out the importance of the proper seasonings of meats, such as rubbing a roast with salt and pepper before placing it in the oven or rubbing the cavity of poultry with seasoning before roasting.

Arrange a field trip to a wholesale fruit and vegetable market. As part of the preparation of the students for the trip, include directions of what to look for and be ready to discuss afterward, such as the following:

Observe the care which the salesmen give to telephone orders for produce.

Learn the meaning of specifications by "grade" for produce.

Observe the total operation from the time produce arrives in big trucks until it is readied for delivery to kitchens, such as your place of employment.

Find out the cost to the wholesaler of filling one order.

Determine why those who provide quantity food service routinely order their food supplies by telephone rather than shop directly in person as a housewife does.

Have the students make a price comparison of fresh, frozen, and canned vegetables and fruits.

Have the students write lunch and dinner menus for one week, using fruit in a variety of ways. Follow this assignment with a class discussion of the menus handed in.

To test the ability of the students to identify the varieties of apples which are best for cooking and those which are best for eating, use the following devices: pictures of apples in magazine and cookbook pictures, a class visit to a fruit market display, and an oral test.

CONCEPTS	CONTENT
Whole grain or enriched cereals and breads, essentially starch or energy foods, are economical sources also of protein, iron, and B vitamins.	4. Breads and cereals a. Nutritional value b. Kinds c. Purchase d. Storage
The use of various fats in the diet provides the main store of reserve food supply.	5. Fats a. Nutritional value b. Source Vegetable Animal c. Consistency Liquid Solid d. Storage
Desserts of a large variety in kind and nutritional value provide a feeling of satisfaction and pleasure at the end of a meal.	6. Desserts a. Nutritional value b. Kinds c. Garnishes

2903

ACTIVITIES

Demonstrate the proper cooking of various fresh, frozen, and canned vegetables; the preparation of a salad; and the preparation of various vegetable and fruit garnishes.

After the demonstrations have been completed, have the students demonstrate the preparation of vegetables and garnishes in their places of employment.

Ask the students to list various different ways of using cereal in the preparation of food.

Call for volunteers to check several stores for prices of ready-to-eat cereals in large boxes compared with the prices of the same cereal packaged in individual-sized boxes, and prepare a report to give to the class.

In order to help students learn to differentiate between yeast breads and quick breads, have them clip magazine pictures of the two kinds of bread to mount, label, and place in their notebooks.

Demonstrate two leavening agents: baking powder added to hot water and soda added to sour milk.

Explain the necessity for some fat in the diet: for energy and for the utilization of the fat soluble vitamins -- A, D, E, and K.

Have the students name and explain the uses of some of the vegetable fats, such as corn oil, margarine, and hydrogenated shortening, and some of the animal fats, such as butter and lard.

Ask for a student volunteer to demonstrate the water method of measuring solid shortening by measuring 1/2 cup of solid shortening in the following steps:

Fill a cup half full of water.

Add shortening to the water until the cup is filled to the one-cup level.

Have the students keep a list of the desserts which they have eaten during one week. Help the students decide which dessert contains the most vitamins and minerals and which, the most calories.

Conduct a student contest to see who can write the longest list of fruit desserts within a time limit.

Have the students bring to class two dessert recipes which contain a large amount of milk. Have each student select one recipe to prepare as a demonstration in her nursing-home kitchen.

CONCEPTS	CONTENT
Mealtime should be enjoyable experience and can be enhanced by courteous and proper service.	C. Food services 1. Tray service 2. Table setting

CONCEPTS	CONTENT

Display in class a variety of prepared puddings and desserts, which are available in the stores, including gelatins, puddings, and prepared mixes.

Ask each student to select pictures of two desserts for each of the four basic food groups, choosing for eye appeal as well as for nutritional value because the dessert is frequently the highlight of the tray. Each student should have the following information about each dessert and be prepared to discuss it in class:

nutritional value to the patient

age and physical condition of the patient to whom it would be served

special considerations in relation to serving the item

size of serving in relation to the patient's need.

Demonstrate the preparation of a pudding, showing a variety of ways to garnish with a whipped topping, coconut, nuts, cherries, or fruit.

Have each student select a pudding and garnish to prepare for approval in her place of employment.

Demonstrate the proper setting of a tray and a table service, including the silver, dishes, napkin, and glasses.

Have each student show her understanding of the proper tray and table setting by preparing a return demonstration in the nursing home where she works.

Call upon a student to demonstrate the proper handling of dishes and utensils, such as picking up silver by the handles, picking up cups by the handles, and handling glassware without touching the rims.

Ask the students to suggest reasons for the following:

avoidance of placing watery foods together on a plate
attractive placement of food on a plate
prevention of spilled coffee or tea in a saucer.

Have the members of the class discuss the importance of the following aspects of food service:

serving hot food hot and cold foods cold
keeping chilled foods in the refrigerator until the time to serve
serving iced desserts after the patients have finished the entree
pouring the coffee or milk at the time of service.

ACTIVITIES

Conduct a discussion of the following aspects of the removal of trays from a patient's bedside or table:

picking up the trays on time
disposing of the leftover food.

As preparation for a role-playing session on the delivery of a tray to a patient and with students assuming the roles of the cook and the patient, have the students discuss the importance of the following:

proper placement of the tray
courteous service
cooperation with the nursing staff in the matter of timing.

SHORT-TERM COURSE FOR COOKS IN LONG-TERM-CARE FACILITIES

UNIT IV: THERAPEUTIC DIETS

CONCEPTS	CONTENT
An understanding of basic principles of therapeutic diets helps the cook in the preparation of food for patients for whom these diets are prescribed.	A. Definition
Normal food recommendations are changed for special diets to meet alterations in the nutritional requirement and/or in the physical characteristics of the diet.	B. Types 1. Normal diets changed in caloric content 2. Normal diets changed in physical characteristics a. Liquid b. Soft c. Low residue d. Bland e. Blended f. Pureed 3. Diabetic diets

ACTIVITIES

A. Definition

With the class develop the following or a similar definition of diet therapy:

> Diet therapy is the science of modifying the normal diet to correct nutritional deficiencies, to afford rest to the whole body or to certain organs, to adjust the food intake to the body's ability to metabolize the nutrients, or to bring about change in the body weight.

B. Types

Have the students list foods that are allowed on a clear liquid diet, such as gelatin, tea, and broth.

With aid of pictures on a flannel board, demonstrate the use of the exchange lists in planning diabetic diets (See "Food Exchange Lists for Diabetic Diets" in the appendix) of the following caloric content values:

1200 calories	1800 calories
1500 calories	2000 calories

Sample meal pattern for a 1500-calorie diabetic diet:

Breakfast

Exchange	Food
1 fruit exchange	1/2 cup orange juice
1 meat exchange	1 poached egg
1 milk exchange	8 oz. glass whole milk
2 bread exchanges	(1/2 cup oatmeal or (1 slice toast
2 fat exchanges	1 teaspoon butter coffee or tea

Lunch

Exchange	Food
2 meat exchanges	2 oz. roast beef
"A" vegetable exchange	lettuce with zero dressing
"B" vegetable exchange	1/2 cup carrots
2 bread exchanges	(1 small baked potato or (1 slice bread
1 fruit exchange	1/2 cup applesauce
2 fat exchanges	2 teaspoons butter coffee or tea

2916

ACTIVITIES

Supper

Exchange	Food
3 meat exchanges	3 oz. baked chicken
vegetable as desired	green beans
"A" vegetable exchange	
2 bread exchanges	1/2 cup rice or 1 slice bread
1 fruit exchange	1 cup strawberries
1 fat exchange	1 teaspoon butter
1/2 milk exchange	4 oz. glass milk
	coffee or tea

8:00 p.m. Nourishment

1 bread exchange	1 slice bread	) Make a
1 meat exchange	1 oz. lunch meat	) sandwich.
1 fat exchange	1 teaspoon mayonnaise)	
1/2 milk exchange	4 oz. glass whole milk	

Give each student a copy of the lists of types of foods that are excluded in the following special diets. Conduct a discussion of plausible reasons for the use of each diet.

Special Diet	Excluded Foods	Reasons for Diet
Low Salt Diet	ham bacon luncheon meats	cardiac disease arteriosclerosis
Low Fat Diet	whole milk cream butter cream soups rich pastries desserts	gall bladder disturbances
Bland Diet	fried foods high seasoned foods raw fruits (except bananas) raw vegetables	ulcers gastrointestinal disturbances
Pureed Foods Diet	solid foods	problems with chewing, swallowing, or digestion
Low Calorie Diet	desserts gravies sauces fried foods	overweight

33/34

SHORT-TERM COURSE FOR COOKS IN LONG-TERM-CARE FACILITIES

UNIT V: ENVIRONMENTAL CONTROL

CONCEPTS	CONTENT
Knowledge of the germ theory of disease promotes and understanding of sanitary food procedures and regulations.	A. Sanitation 1. Microorganisms a. What their general characteristics are b. Which kinds multiply in food c. How they are transferred from place to place Hands Clothes Utensils Dishes Food Work area d. How they may be destroyed Heat Chemical agents e. How cleanliness prevents them from spreading f. How their growth in food is controlled Production Tasting techniques Care of work area Refrigeration Storage Service 2. Community health a. Food legislation b. Health examination for food handlers c. Insect and rodent control d. Water supply controls
Good housekeeping controls promote a sanitary environment.	B. Housekeeping

ACTIVITIES

A. Sanitation

Have each student report on a phase of community health which has a direct bearing on his job as a cook, such as the following:

the Board of Health ruling that food handlers must wash their hands after using the toilet and before returning to work

what the health examination for food handlers includes

what the Board of Health inspectors look for when they inspect a kitchen in a nursing home.

Ask the student volunteers to demonstrate and explain the following techniques:

proper tasting techniques
use of throw-away gloves for making salads.

Invite a representative from the Chicago Board of Health to give a blacklight demonstration, using the following examples:

dishes and utensils which have not been sanitized, so that students may see the bacteria on unclean articles

dishes that haveen sanitized but have been improperly stored

glasses and cups that have been handled by the rims

silverware that has been handled by the bowls, tines, and blades.

Demonstrate ways of preventing contamination in preparation, handling, and storage of such foods as salads made with mayonnaise, custards and puddings, and cream sauces.

B. Housekeeping

Invite a representative from a company, such as a detergent manufacturer, to give a lecture and demonstration on the proper methods of hand and machine dishwashing. Ask the speaker to include washing, rinsing, temperature control, and the type and amount of detergent to use.

CONCEPTS	CONTENT
	b. Dishwashing Hand Machine Pot washing c. Garbage disposal
Habits and attitudes which will tend to eliminate accidents can be developed in the individual.	C. Safety 1. Causes of accidents a. Lifting hot pans without pot holders b. Greasy hands c. Wet hands d. Improper use of a knife e. Poor body mechanics in lifting f. Spilled food on the floor 2. Attitudes and accident prevention a. "Think before you leap." b. "Haste makes waste." c. "Better safe than sorry." d. "A stitch in time saves nine." e. <u>Rules of the Road</u>

ACTIVITIES

C. Safety

Ask the students to mention some common accidents and tell how each one might be avoided.

Example: Knife cuts

Cut away from yourself.

Never use a knife to open a jar or can.

Hold both a knife and food in such a way that, if the knife slips, you will avoid cutting your fingers.

Example: Falls

Wipe up immediately anything that is spilled on the floor.

Stand on a stepladder or step stoal to reach for an item on a high shelf.

Do not carry such large objects that you cannot see where you are going.

Ask for a student to volunteer to demonstrate how to perform the following tasks in such a way as to avoid burns:

lifting of lids from saucepans
pouring of hot liquids from saucepans
adding of liquid to hot fat
handling of electrical appliance cords.

SHORT-TERM COURSE FOR COOKS IN LONG-TERM-CARE FACILITIES

UNIT VI: ORDERING TECHNIQUES AND INVENTORY CONTROL

CONCEPTS	CONTENT
Careful planning and good judgment are necessary in order to make satisfactory food purchases.	A. Procurement of food 1. Establishment of buying schedule a. Daily b. Weekly c. Monthly d. Yearly 2. Factors affecting buying schedules a. Menu requirements b. Available storage space c. Available funds 3. Elimination of emergency buying (except seasonal goods) 4. Determination of proper quantity a. Standard recipe or yield table b. Wholesale buying 5. Receiving ordered goods a. Checking Quality Count Weight b. Immediate storage
Proper storage and inventory control cuts food costs and prevents unnecessary purchases.	B. Storeroom organization 1. Continuous rotation of stock 2. Types of storeroom inventories a. Perpetual b. Daily

2921

ACTIVITIES

A. Procurement of Food

Lead the students into a general discussion of the factors to consider in the buying of food, such as the season, schedule, requirements, storage space, and funds available.

Have the students explain what foods may be purchased in large quantities and what ones in small quantities.

Conduct a discussion on the wisest time to purchase each of the different forms of foods: fresh, frozen, canned, and dried.

B. Storeroom Organization

Ask the students to suggest good rules for an efficient storeroom organization, such as rotation of stock; orderliness, including labeling; and cleanliness.

Explain the types of inventory and the advantages and disadvantages of each type, for example, physical inventory and perpetual.

ACTIVITIES

Have the students, with teacher assistance, set up an ordering and inventory form that could be used in the storeroom of the nursing homes in which they are employed.

Supervise each student's arrangement of the storeroom in the nursing home in which she is employed, so that foods are placed according to kind -- fruits, vegetables, juices, cereals.

2924

APPENDIX

2925

QUALIFICATION FOR CERTIFICATION

I. Attendance

No more than six (6) absences will be permitted during the twenty-four week period.

II. Theory

The student must show some improvement from test to retest. (Written or oral tests are given, depending on the reading and writing abilities of the student.)

III. Performance

The student should have received a satisfactory rating in the teacher's evaluation of her performance. She is expected to show progress in the following areas:

Attendance	Attitude
Personal appearance	Work performance

2926

COOK-TRAINEE EVALUATION

NAME OF TRAINEE _____ NURSING HOME _____

DATE OF EVALUATION _____ EVALUATED BY _____

	Improvement needed				
	None	Slight	Some	Much	Remarks
I. ATTENDANCE					
A. On the job					
B. At the weekly class					
II. PERSONAL APPEARANCE					
A. Uniform - Neat and Clean					
B. Shoes polished					
C. Hair neat with hair net					
D. Fingernails, clean and trimmed					
III. ATTITUDE					
A. Toward job					
B. Toward patients					
C. Toward course					
IV. WORK PERFORMANCE					
A. Trainee's organization of daily duties					

SASS 2927

2928 5851

	Improvement needed				
	None	Slight	Some	Much	Remarks
B. Trainee's working relationship with co-workers					
C. Trainee's use of advance preparation (such as making gelatin or chopping vegetables) to facilitate production time					
D. Trainee's efficiency in following instructions 1. Menu 2. Minimum daily requirements 3. Directions of food preparation 4. Accurate measurements					
E. Trainee gives clear, precise instructions to her co-workers.					
F. Trainee checks menu for following day to make sure necessary food supplies are on hand.					
G. Trainee checks food items, such as meat, for quality and amount on delivery.					

V. THERAPEUTIC DIETS

A. Trainee has a working knowledge of special diets used most often (such as diabetic, bland, low salt and low fat).					

	Improvement needed				
	None	Slight	Some	Much	Remarks
B. Trainee follows through on diet orders as given by doctor and dietitian.					
VI. EQUIPMENT					
A. Trainee has necessary equipment to perform her duties efficiently or she is able to improvise.					
B. Trainee requests special pieces of equipment and justifies their need.					
VII. SANITATION					
A. Kitchen and surrounding areas are clean (work tables, walls, counters, floors).					
B. Kitchen equipment is clean (mixers, toasters, utensils).					
C. Trainee uses correct method of dishwashing (hand or machine).					

2929 0025

	Improvement needed				
	None	Slight	Some	Much	Remarks
VIII. PREPARATION OF FOOD TO PRESERVE AESTHETIC VALUE					
A. Does trainee use garnishes?					
B. Does trainee consider color combinations?					
C. Does trainee arrange food attractively on plate?					
IX. TRAINEE'S CONSIDERATION OF PATIENT PREFERENCES					
X. TRAINEE'S USE OF NEW RECIPES AND IDEAS LEARNED IN WEEKLY CLASS

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

FOOD EXCHANGE LISTS FOR DIABETIC DIET[1]

Milk Exchanges (list 1)

One milk exchange contains 12 grams carbohydrates, 8 grams protein, 10 grams fat, and 170 calories. Milk is one of our most important foods. Use the milk on the meal plan to drink in coffee, on cereal, or with other foods. This list shows the different types of milk to use for one exchange.

Whole milk (plain or homogenized)	1 cup (1/2 pint or 8 oz.)
Skim milk	1 cup
Evaporated milk	1/2 cup
Powdered skim milk (nonfat dry milk)	1/3 cup of instant type or 1/4 cup of regular type (Read directions on box.)
Buttermilk, cultured or churned (made from skim milk)	1 cup
Buttermilk, Bulgarian (made from whole milk)	1 cup
Cocoa or chocolate milk (made from 1 cup milk, 2 teaspoons cocoa, artificial sweetener), no more than once daily	1 cup

One type of milk may be used instead of another, for example, 1/2 cup evaporated milk in place of 1 cup of whole milk. When skim milk or buttermilk made from skim milk is used in place of whole milk, add two fat exchanges to the meal to get the same food value.

Vegetable Exchanges (List 2)

All vegetables contain sugar but some have more sugar than others. The vegetables have been divided into three groups according to the amount of sugar they contain, as follows:

vegetables having the smallest amount of sugar in List 2A
vegetables containing more sugar in List 2B
vegetables having a large amount of sugar included in List 4.

---

[1]The meal planning with exchange lists in this manual are based on material in "Meal Planning with Exchange Lists" prepared by a Joint Committee of the Diabetes Association, Inc., and the American Dietetic Association, in cooperation with the Diabetes and Arthritis Control Program, National Center for Chronic Disease Control, Public Health Service, Department of Health, Education, and Welfare.

Vegetable Exchanges (List 2A)

Containing little carbohydrate or protein and few calories, these vegetables, in raw form, may be eaten as desired in ordinary amounts. If cooked, no more than 1 cup at a time may be used.

Asparagus
Broccoli
Brussels sprouts
Cabbage
Cauliflower
Celery
Cucumbers
Eggplant
Endive
Escarole
Green beans, young
Green pepper
Greens
- Beet greens
- Chard
- Collards
- Dandelion
- Kale
- Mustard
- Poke
- Spinach
- Turnip greens

Mushrooms
Okra
Onions, green, young
Radishes
Romaine
Sauerkraut
Squash, summer (white, yellow, zucchini)
Tomato juice and tomatoes (limit to 1/2 cup or 1 tomato per meal)
Watercress

Vegetable Exchanges (List 2B)

One-half cup of each of these vegetables equals one exchange and contains 7 grams of carbohydrate, 2 grams of protein, and 35 calories. These vegetables contain more sugar than vegetables in List 2A. Use these vegetables raw or cooked.

Artichoke, 1 medium
Beets
Carrots
Green beans, mature
Mixed vegetables, frozen
Onions, dry
Peas, green
Pumpkin
Rutabagas
Squash, winter (acorn, hubbard, butternut)
Tomato soup: 1/4 cup as it comes from the can
Turnips
Vegetarian vegetable soup: 1/2 cup as it comes from the can

Any of the following may be substituted for 1 vegetable exchange 2B: 1 cup of List 2A raw vegetables, 1/2 bread exchange (List 4).

Fruit Exchanges (List 3)

One fruit exchange contains 10 grams carbohydrate and 40 calories. Use fresh, dried, cooked, unsweetened frozen, or unsweetened canned fruit. Canned fruit may be water packed or juice packed (but not packed in syrup). A serving of canned fruit is considered as the solid portion with its share of liquid from the can.

Kind of Fruit	Amount To Use
Apple (2"diameter)	1 small
Applesauce	1/2 cup
Apple juice	1/3 cup
Appricots, fresh	2 medium

2939

Apricots, dried	4 halves
Banana	1/2 small
Blackberries, raspberries, strawberries	1 cup
Blueberries	2/3 cup
Cantaloupe (6" diameter)	1/4
Cherries	10 large
Dates	2
Figs, fresh	2 large
Figs, dried	2
Gooseberries	1/2 cup
Grapefruit	1/2 small
Grapefruit juice	1/2 cup
Grapes	12
Grape juice	1/4 cup
Honeydew melon (7" diameter)	1/8
Orange	1 small
Orange juice	1/2 cup
Peach	1 medium
Pear	1 small
Pineapple	1/2 cup (or 2 slices)
Pineapple juice	1/3 cup
Plums	2 medium
Prune juice	1/4 cup
Prunes, dried	2 medium
Raisins	2 tablespoons
Tangerine	1 large
Watermelon	1 cup

Bread Exchanges (List 4)

One bread exchange contains 15 grams carbohydrate, 2 grams protein, and 68 calories. Measure all the foods on this list after they have been cooked.

	Amount To Use
Bread (all kinds except raisin bread and gluten bread)	1 slice
Biscuit, roll (2" diameter)	1
Cornbread (1 1/2" cube)	1
Hot dog or hamburger bun	1/2 bun
Melba toast, oblong	4
Melba toast, round	8
Muffin (2" diameter)	1
Pancake (5 1/2" diameter), omit 1 fat exchange	1
Waffle (5 1/2" diameter); omit 1 fat exchange	1/2
Cereals (cooked)	1/2 cup
Dry, flake and puff types (plain unsweetened)	3/4 cup
Shredded wheat	1 biscuit
Rice, grits, cooked	1/2 cup

2935

Spaghetti, macaroni, noodles cooked	1/2 cup
Crackers, graham (2 1/2"square)	2
Oyster crackers (1/2 cup)	20
Ry-krisp, double square wafer	3
Saltines (2" square)	5
Soda (2 1/2" square)	3
Round, thin (1 1/2" diameter)	6-8
Wheat thins	12
Flour	2 1/2 tablespoons, level
Cornstarch	2 tablespoons, level
Vegetables	
Beans and peas, dried, cooked (lima, navy, pintos, split peas, cowpeas, blackeyed, etc.)	1/2 cup
Beans, lima, fresh or frozen	1/2 cup
Baked beans, no pork	1/4 cup
Corn	1/3 cup
Corn on cob (4"long)	1 ear
Hominy	1/2 cup
Parsnips	2/3 cup
Popcorn	1 cup
Potato chips, large (3" diameter); omit 2 fat exchanges	10
Potatoes, white, baked, boiled (2" diameter)	1
Potatoes, white, mashed	1/2 cup
Potatoes, sweet or yams	1/4 cup
Sponge cake, plain (1 1/2" cube)	1
Ice cream (omit 2 fat exchanges)	1/2 cup
Ice milk (omit 1 fat exchange)	1/2 cup

Meat Exchanges (List 5)

One meat exchange contains 7 grams protein, 5 grams fat, and 73 calories. Meat should be measured after it is cooked. Remove bones and extra fat before measuring. One fourth of a pound (4 oz.) of raw meat without bones and fat usually weighs 3 ounces after cooking. An average size serving of meat would be 3 meat exchanges (or 2 meat balls, a small steak which weighed 1/4 lb. before cooking, 1 pork chop, 1 veal chop, 2 lamb chops, or 3 of any of the foods listed below.) A 3 oz. slice of cooked meat measures approximately 3 x 2 x 1/2 inches; a 2 oz. slice, 2 x 2 x 1/2 inches.

	Amount To Use
Meat and poultry (medium fat) (beef, veal, lamb, pork, liver, game, chicken, etc.)	1 oz.
Cold cuts (4 1/2 inch square--1/8 inch thick) (all-meat type) (salami, minced ham, bologna, liverwurst, luncheon loaf)	1 slice
Frankfurter (8 or 9 per lb.) (all-meat type)	1 slice

2936

Fish:	
Catfish, perch, bass, trout, etc.	1 oz.
Salmon, tuna, lobster, mackerel--fresh, frozen, or canned (with or without oil)	1/4 cup
Shrimp, clams, oysters, etc.	5 small
Sardines	3 medium
Cheese:	
Cheddar or American	1 oz.
Cottage cheese, creamed	1/4 cup
Egg	1
Peanut butter	2 tablespoons

Fat Exchanges (List 6)

One fat exchange contains 5 grams fat and 45 calories. The fat exchanges may be used in cooking. For example, a teaspoon of fat (1 fat exchange) may be used to fry an egg or to season a serving of vegetables, if the meal plan permits.

	Amount To Use
Butter or margarine	1 teaspoon or 1/2 pat
Bacon, crisp	1 slice
Coconut, grated	2 1/2 tablespoons
Cream, light, half and half	2 tablespoons
Cream, heavy, 40% (whipping cream)	1 tablespoon
Cream cheese	1 tablespoon
Avocado (4"diameter)	1/8
French dressing	1 tablespoon
Mayonnaise	1 teaspoon
Oil or cooking fat (as bacon grease)	1 teaspoon
Nuts	6 small
Olives	5 small
Sour cream	2 tablespoons

ABSTRACT - Prepared by the Nursing Home Branch of the Division of Health Resources, this handbook provides guidelines for activities supervisors in long-term care facilities. Topics are: (1) Qualifications of an Activities Supervisor, (2) Activities in General, which describes the six general types of activities and group and individual activities, (3) Establishing the Program, which suggests ways of finding interests and discusses budgeting, space, and equipment requirements, (4) Organizing and Running the Program, which provides information about the role of the administrator, consultants available to the supervisor, staff and volunteers needed, using volunteers effectively, developing an activities schedule, k eping records, and maintaining an effective program, and (5) Instructions for Selected Activities, which suggest ways to motivate participants, teach an activity, and includes several activities and resources. A discussion of health problems requiring long-term care and suggested readings are appended. (SB)

2943

Preface

All major Federal health programs are concerned with long-term care, and patient activities constitute an essential feature of that type of medical care.

Since no comprehensive manual covering this important field has been available, the Nursing Home Branch of the Division of Health Resources has developed this handbook for the guidance of Activities Supervisors in long-term care facilities.

All aspects of patient activities are covered, from the rationale for such programs to instructions for selected activities. It is hoped that the guide will not only prove useful to individuals directly responsible for activities programs but will serve as a valuable reference for all professional personnel engaged in the rapidly growing field of long-term medical care.

John Cashman, M.D.

John W. Cashman, M.D.
Assistant Surgeon General
Director, Community Health Service

2944

Introduction

As activities supervisor in a long-term care facility you play a vital role in helping individuals return to normal, active lives. This is a great responsibility, for in many instances, the effectiveness of your activities program can make the difference between living . . . and just existing. The purpose of long-term care differs from that of acute care. In acute care facilities physicians and others do things *for* patients; in long-term care facilities patients are encouraged to do things, once again, for *themselves*.

Life itself is an unplanned, unscheduled, uncoordinated activities program. Everything we do, from breathing to bathing, from singing to seeing, can be considered an activity.

And everything we do also can be considered an exercise for whenever we participate in an activity, no matter what, we are exercising our ability to master the activity. When we walk, we exercise our *ability* to walk. When we read, we exercise our *ability* to read. When we talk with others, we exercise our *ability* to be sociable and friendly.

Long-term illness can remove a person from the everyday world where normal activity and exercise is completely taken for granted. And if the reasons for exercising which were present in the everyday world no longer exist, the individual simply may stop exercising. When a person stops exercising, he begins to lose his ability to do things. If a person no longer wants to walk, because it is easier to move in a wheelchair, he eventually may not be able to walk because his muscles have atrophied from lack of use. In fact, he may throw away his ability.

The purpose of an activities program is to create as near to a normal environment as possible, thereby encouraging persons in a long-term care facility to exercise their abilities. An activities program provides physical, intellectual, social, spiritual and emotional challenges much in the same way that everyday life in the community provides such challenges. But there is a difference.

An activities program provides these challenges in a planned, coordinated, structured manner. The activities provided are carefully selected so that they not only are enjoyable, but also are especially beneficial in overcoming specific problems. For example, a stroke victim participates in enjoyable activities which not only conserve and strengthen the abilities which have not been affected, but which also exercise and encourage use of those faculties which have been impaired. Without an activities program, such a person would not use the impaired faculties and, perhaps through depression and withdrawal, might not want to do anything at all. He would, therefore, lose even what abilities he had left. Without an activities program, he eventually would lose all hope.

The most challenging part of your job, therefore, is to encourage people to participate—to get them involved. You can have the most varied and exciting activities program in the world, but if a person does not want to participate, he obviously receives no benefits.

So your job is to provide activities which present a challenge, which make people want to participate, and to achieve. For just as activity is the sign of life, achievement is the purpose of life. No matter how small the achievement, it is still an achievement. Achievement brings with it dignity, self-respect and self-reliance. And it brings with it the desire to achieve more. The desire to achieve more means participation in even more activities.

The more activities, the more exercise; the more exercise, the more a person has the ability to do.

In the last analysis, then, an activities program is the environment of challenge, of achievement and hope. An activities program can help a person along on the road to recovery. It brings with it a dignity of life. It creates a purpose for living —to go on, to do more, to achieve more. It is your job to create this environment for others. That is your challenge. It is a challenge marked by many achievements, and just as you can help make life worthwhile for those you serve, their accomplishments can help make your life richer and fuller than you ever thought possible.

OPCS 2945

Qualifications of an Activities Supervisor

It takes skill to carry out an effective activities program. But even more important than skill are certain personal qualities. Skills can be learned—that is one of the purposes of this guide—but personal qualities are attributes that you either have, or don't have. You don't learn them.

First and foremost, you must have absolute faith that engaging in meaningful activity is necessary for all people. From this comes your desire to work with the ill, aged and disabled.

You must have the ability to establish and maintain effective working relationships with the administrator, consultant, nurses, food service personnel, nurse's aides, volunteers and the individuals you serve.

You must be able to assume responsibility for planning and carrying out an activities program.

You must be flexible enough to change plans when the situation warrants.

You must have enthusiasm and a willingness to learn new ideas and new skills.

You must be able to understand where your job ends, and another's begins.

And you also must have imagination, initiative, a sense of humor, friendliness, conscientiousness and patience.

Without these attributes you cannot succeed. With them, you cannot fail. With them you will be able to learn the basics—the knowledge and philosophy of rehabilitation and the knowledge of the activities to be used.

2946

Activities in General

2947

Types of Activities

There are six general types of activities which may be adapted for your program in the nursing home setting. Specific activities within any one of the six types may range from the very simple to the very complex; from passive involvement to heavy active involvement; from individual participation to group participation. For an activity program to meet all the diverse needs of those involved, all six types of activities must be provided with as many variations as possible. The six types of activities are:

Social Activities

Social activities can help minimize self-consciousness, increase self-confidence, and stimulate interest and friendships by providing fun and enjoyment for those who take part. Typical social activities include square, folk and round dancing, group singing, horseshoes or quoits, adapted bowling, charades, cards, checkers and bingo.

Recreational activities with an emphasis on social aspects include outings to places of interest such as historic places, museums, ball games, fairs, and parks. You also can encourage persons in your care to join community groups and religious organizations, helping them to take a more active role in community life.

Diversional Activities

Diversional activities place the emphasis on individual accomplishment rather than sociability and fun. Such activities serve to take an individual's mind off worries and help him to adjust to long-term illness and long-term care. Typical diversional activities include braiding rugs, sewing, painting, refinishing furniture, and repairing or making toys.

Work-Type Activities

People need a balance between work and play. It is particularly important when leisure hours are great in number to include some work substitute. In addition, many people have grown up in an environment where leisure is considered only for the idle wealthy and where play bordered on the sinful. Do not try to remake the opinions and habits of a lifetime. Work with them. Provide activity which can be regarded as meaningful work.

Depending on the individual involved and his abilities, work-type activities can range from making a bed and ironing personal laundry to a completely structured workday—repair shop work, general ironing, bedmaking, dusting, etc. *Do not become involved in paying individuals for work-type activities without first consulting legal counsel. Legal, welfare and labor relations considerations all are involved.*

You also might investigate the possibility of establishing a sheltered workshop. Local wholesalers or manufacturers pay people for simple assembly procedures or for repairing damaged articles. Some state parks also pay for making simple items.

Volunteer Service Activities

Volunteer service activities are similar to work-type activities except volunteer aspects are stressed. Typical service activities are folding and mailing church literature, preparing material for a community fund drive, wrapping bandages, or making or repairing toys for underprivileged or orphaned children.

There also are buddy-system activities in which one person assists another in activities such as eating, dressing, reading, ambulation, playing games, etc.

Intellectual Activities

There must be activities for intellectual and creative expression. Some obvious activities are discussion groups, voting, book reviews, sketching, drama, and music appreciation. Consult your local library for availability of such materials as books, talking books, records and films.

Other vehicles for intellectual activity are clubs and committees.

Spiritual and Religious Activities

Spiritual and religious activities are especially important as religious convictions tend to increase in later years.

2948

NO INDIVIDUAL SHOULD BE REQUIRED TO PARTICIPATE IN ANY ACTIVITY.

NO INDIVIDUAL WITH A MEDICAL PROBLEM SHOULD PARTICIPATE IN ANY PHYSICAL ACTIVITY WITHOUT WRITTEN APPROVAL FROM THE ATTENDING PHYSICIAN.

Group Activities

Group activities, the involvement of a number of people in physical and mental interaction, are vital to an effective program. There are several reasons for this. Most obvious is the fact that group participation results in maximizing your resources—enabling you to involve many people within a specified budget of time and money. Less obvious, but perhaps more important, group activities promote social interaction. Having several people involved in one activity promotes communication which helps the development of friendships. In this light, group activity can help overcome feelings of loneliness, isolation and self-pity which all too frequently accompany long-term illness and long-term care.

The degree of social interaction created by a group activity is directly related to the amount of involvement of each individual both with the activity itself and with other members of the group. Generally speaking, group activities can be divided into five general categories based on degree of involvement. These five involvement categories are:

1. **Spectator group activity,** such as attending an athletic contest or a movie, where members of the group are passively involved, not actively participating;
2. **Performing group activity,** such as dancing or singing, where people are performing for themselves or for others;
3. **Independent group activity,** where each individual in a group is working on his own project;
4. **Independent/Interdependent group activity,** such as making dressings for the Cancer Society, where the total project is dependent on each group participant making the same item or performing the same task as all other members of the group, and;
5. **Interdependent group activity,** such as publishing a newspaper, where the completion and success of the total project is dependent on each participant completing a separate and distinct part of the total project.

Just as the greatest degree of involvement will produce the most beneficial results in terms of social interaction, inability or failure to perform at a high degree of involvement can produce undesirable results. Conversely, failure or inability to perform at the lowest degree of involvement will cause the least harmful results. As an example, falling asleep at a spectator group activity such as a lecture will cause no problems for the group. On the other hand, falling asleep while the group is trying to meet a deadline for completing an interdependent activity can cause major problems. It could lead to guilt feelings and withdrawal from self-ridicule or from the ridicule of other members of the group, not to mention causing possible total disruption of the activity. Thus, it is of utmost importance that you place an individual in that group activity in which he is best able to participate physically, mentally and emotionally.

Individual Activities

Because everyone has a need for personal identity, and because some in your home are unable to participate in group activities, you must provide individual activities.

For those who need individual activities as another part of an overall program, activities such as reading aloud or painting a picture virtually are unlimited. But for those who are unable to attend group activities, the scope of activity is more limited, and merits careful selection.

For those whose physical disabilities prohibit

2949

movement to a group activity area, your individual activity program must provide:

1. activities which make maximum use of each individual's physical and mental capabilities;
2. activities which are interesting to and involve the individual, and which present a challenge that can be met, and;
3. activities *which do not interfere with* scheduled nursing and housekeeping routine.

For those who have severe emotional problems or are not alert enough to become part of a group, your program must provide:

1. activities which are basically uncomplicated, but which can become more elaborate to accommodate increased ability, such as making yarn animals or games like checkers or dominoes;
2. short periods of concentration to avoid frustration, and;
3. enough time for you to develop a close relationship with the person involved, allowing you to recall his attention should his mind wander.

Obviously an individual activities program cannot provide the social interaction which is the key "fringe benefit" of group activities. Therefore, a major goal of your individual activities program should be the eventual involvement of the person in group activities if at all possible.

2950

Finding the Interests of Individuals

The development and implementation of your program depends primarily on what the individuals themselves want to do. Do not ride roughshod over individual preferences. In some cases one of your biggest challenges will be channeling an interest into an activity.

There are several ways to determine what general interests are.

The first and most obvious method is to make a list of those activities which are available or which could be made available and interview each person to solicit preferences. This same technique could be used with an individual's family which could indicate past interests.

Another technique is to refer to admission forms and records, but only with approval of the administrator. Past experiences of the individual can suggest ideas for current activities. A former sheet metal worker, for example, might be very interested in metalcrafts. In addition, having knowledge of past experience provides the basis for conversation, and putting into contact with each other those who have shared past interests.

Another source of information is staff and volunteers, to whom an individual may have mentioned a desire for trying one form of activity or another.

In general, learning an individual's interests is the key to planning the start of the program, and just as important, it is the key to keeping your program continually effective.

A past interest, however, does not mean that a person necessarily will want to take up something similar now. This could be due to feelings of inadequacy, general depression, desire to learn something different or physical or emotional limitation.

Lists of Possible Activities

The following alphabetical lists of activities are partial only and should be used to stimulate your own thinking. They also can be used to locate areas of interest of individuals entering the activities program, as well as for volunteers.

Adapted Basketball
Adapted Bowling
Art
Art Foam Projects
Anagrams
Auctions and Craft Sales
Auto Rides
Backgammon
Badminton
Balloon Volleyball
Band
Bandage Making
Basketry
Bean Bag Toss
Bedmaking
Bible Class
Billiards
Bingo
Birdfeeder Construction
Bird Feeding
Bird Watching and Walks
Block Printing
Blueprinting
Bookbinding and Repair
Book Reviews
Box Hockey
Bowling
Braiding
Braid Weaving
Bridge
"Buddy System" Work
Bumper Pool
Bunco
Candlemaking
Cards
Caroms
Carpentry
Carving (Soap and Wood)
Ceramics
Charades
Checkers
Chenille Craft
Chess
Chinese Checkers
Church Services
Clay and Plastercraft
Clubs (Camera, Garden, Book, Choral, etc.)
Colonial Mat Making
Collecting (Stamps, Coins, Rocks, etc.)
Community Service
Cooking
Cootie
Copper Tooling
Cork Craft
Cribbage
Crocheting
Croquet
Crossword Puzzles
Dancing
Darts
Decorations
Discussion Groups (Current Events, Literary, Sports, Bible, etc.)
Dominoes
Drawing
Dramatics
Education
Embroidery
Flower Arranging
Flower Making
Fly Tying
Furniture Refinishing
Games (Table, Active, Guessing, etc.)

Bingo (Magazine and Music)
Bowling
Guessing Games
Horseshoes
Relays
Ring Toss

Budgeting Requirements

The budget for your activities program must be prepared in cooperation with the administrator. It is up to you, however, to prepare a basic suggested budget which will cover equipment,

2954

supplies, and salaries. In this manner the administrator will be able to best determine budgetary limits.

Your budget is divided between nonexpendables and expendables. Nonexpendables include basic furnishings (tables, chairs, etc.) and basic equipment (phonograph, table looms, etc.) Expendables are comprised of general supplies (paper, paints, etc.) and personnel salaries and wages.

Your budget, of course, is limited. It is up to you, therefore, to make maximum use of funds available. Since your heaviest expenses are likely to be for nonexpendables, determine what your immediate needs are, and what items can be purchased sometime in the future. For example, if a few persons are interested in ceramics, the kiln at a high school, community center or hobby shop may be used rather than purchasing one of your own. Investigate what nonexpendables are already on hand. Do not purchase additional tables and chairs, for example, if some are available or could be adapted easily. Investigate the possibility of purchasing good used equipment. Determine if some equipment possibly could be donated. By all means, shop around to determine the best value before purchasing.

Budgetary allowances for expendables also must be based on the interests of program participants. If there is widespread interest in painting, for example, you must order and reorder items such as canvases, paints, brushes, etc. Determine if costs of such items will be borne entirely by program participants, by your facility, or shared. See if local merchants might be willing to offer special discounts. Some might be willing to make donations. Do not overlook purchasing from mail-order houses and shopping around for volume discounts.

A basic determination also must be made regarding the sale of crafts projects. Revenue can be obtained from the sale of toys, paintings, ashtrays, etc. Depending on basic fiscal policy of your facility or agreements established between facility and patient, part or all of such revenues might be returned to the individual or used by a patient council for the purchase of more supplies and/or equipment.

As in all other phases of your activities program, therefore, maximizing your basic resources depends on your own effective planning and resourcefulness.

Space Requirements

IT IS THE RESPONSIBILITY OF THE ACTIVITIES SUPERVISOR TO BE AWARE OF ALL POLICIES REGARDING ACCIDENT AND FIRE PREVENTION AND EMERGENCY PROCEDURES AND PRECAUTIONS.

The more space available to your activities program, the better. In most cases, however, space will be limited and it will be up to you to use to its fullest advantage the space that is available.

Basically there are nine kinds of space needed. One area may serve several purposes.

Spectator Group Activities Area

Such an area could be used for large social, intellectual, religious, clean craft and like activities in conjunction with a dining room, lounge, or other area whose purpose is other than program-related activities. The area can be used only when not interfering with normally-scheduled events. It should be large enough to seat three-fourths of all those in the facility for events such as movies, concerts, Christmas programs, lectures, etc. Special planning must consider set-up and clean-up times involved, as well as other scheduled uses of the area.

Personal Activities Area

A personal activities area could be a day room near to bedrooms where there is a TV and comfortable chairs for reading or letter writing. It also could be used for activities such as individual crafts or games, and therefore should have tables to seat four people.

Quiet, Private Area

There should be a room which is comfortable and can allow for quiet and privacy, if desired, for club and committee meetings, clean crafts

2955

and quiet group games. Depending on the activity to be performed, some storage area might be necessary. Such an area also could be used as a day room, library, staff meeting room, etc. Good lighting is essential. In large homes especially, several such areas should be available.

Noisy Recreation Area

Provision should be made for an uncluttered area, removed from bedroom areas, and near the hub of the facility's activities to permit noisy recreation. Size of such an area depends on the number of persons who would be participating there and the types of activities planned, such as pool, indoor horse shoes, shuffleboard, rhythm band, etc.

Preparation Area

Preparation area is space where donated supplies can be examined, labeled and otherwise prepared for storage or program use; where party decorations can be left to dry, and where all power equipment would be kept. Such an area could be part of a larger activities area.

Area for Diversional, Work-Type and Volunteer Service Activities Which Tend To Create Clutter, Dust and Noise

If you intend to include a program of noisy, "dirty" crafts, you need an area that can be used solely for your program. Multiple usage (also being a dining room, for example) creates inconvenient time and clean-up requirements which would defeat the purpose of the room. Because of the variety of equipment which would be needed, the Public Health Service's Nursing Home Branch advises allowance of 36 square feet per person who would be in the area at one time.

Such an area should be near lavatories but removed from bedroom areas. It also should meet the following considerations if applicable:

LIGHTING

It is recommended that a combination of natural, flourescent and incandescent lighting be used. Flourescent alone tends to distort and confuse distance judgment due to the absence of shadow. More light is needed where high eye-hand coordination is required, such as in woodworking, sewing, etc.

CLIMATE CONTROL AND VENTILATION

Provision should be made for even heating and cooling. Special consideration should be given for the removal of noxious odors and dust, especially in craft areas.

ELECTRICAL WIRING

Sufficient electrical outlets should be allowed for maximum mobility of equipment. Placing outlets at six-foot intervals is recommended. The planning for a 220-volt outlet, as required by an electric kiln, must take into consideration traffic patterns and the heat generated by the equipment using the outlet. A light warning system in the corridor should be installed to indicate when 220-volt equipment is in use.

SPACING

Aisles and work areas must be large enough to permit wheelchairs to pass one another.

COMMUNICATIONS

A telephone should be installed to permit staff or volunteers to place or receive calls without leaving the work area as well as for emergency communication.

Outdoor Recreation Area

An outdoor recreation area should have a smooth, paved surface and be level to permit individuals to walk without tripping. There should be an easy transition from paved areas to grassy areas to prevent tripping. Grassy areas also should be level.

The outdoor recreation area can be used for picnics, shuffleboard, horseshoes, croquet, gardening, religious activities, etc.

Furniture for the area should be sturdy and nontippable.

Office Area

An office area should be provided for you to keep track of records, correspondence, etc. A telephone and a writing surface are needed as well as a lockable drawer in a desk, or a lockable file cabinet to keep privileged information.

2956

Storage Space

It is essential that adequate storage space be available. The amount required depends on the type program being undertaken. All regularly-used items which cannot be left out must be stored in an area near where they are used. Those items which are used only on occasion can be stored relatively distant from their areas of use. Special storage areas must be provided for storage of edged or otherwise dangerous equipment.

Flammables, for example, must be stored in metal cabinets. Large metal cabinets also may prove useful for storage in areas where additional space is needed.

Basic Equipment

Some of the basic equipment you will need includes:

TABLES

Tables should be at a comfortable working height and tall enough to accommodate a wheelchair.

CHAIRS

Chairs with and without armrests, should be sturdy, nontippable and have a straight back for support and proper posture.

DESK

You should have your own desk for storage of files and personal items.

CUPBOARDS AND CABINETS

WOODWORK BENCH

BULLETIN BOARD

PORTABLE BLACKBOARD

SINK

One which is cleaned easily and which has counter space on both sides.

SEWING MACHINE

Some enjoy the treadle type, but electric also are necessary.

TABLE LOOMS

Also consider storage area they require when not in use.

NEEDLECRAFT EQUIPMENT

Some needlecraft equipment includes sewing and knitting needles, scissors, embroidery hoops, crochet hooks, thimbles, etc.

WOODWORKING TOOLS

Some basic hand woodworking tools include a cross-cut saw, hammers, mitre box, screwdrivers, planes, hand drills, sanding blocks, C-clamps, etc. If power tools are used, they must have locks to prevent them from being turned on without knowledge of the person in charge.

MISCELLANEOUS CRAFT EQUIPMENT

Some miscellaneous craft equipment includes paint brushes, leather working tools, etc.

Another basic craft program is ceramics. If sufficient individual enthusiasm is noted, a kiln should be included as a basic craft need.

MISCELLANEOUS NONCRAFT EQUIPMENT

Some miscellaneous noncraft equipment includes:

Piano

Phonograph and Records
An inexpensive, reliable portable might be an appropriate first purchase. Be sure service is available.

Sound Movie Projector and Screen

Jigsaw Puzzles
For patients with poor vision, adult puzzles with large pieces.

Games
Some basic games include bingo, dominoes, cards (regular and jumbo), checkers, cribbage, horseshoes, adapted bowling, Scrabble, etc.

Party Equipment
Barbecue grill, ice cream freezer, popcorn popper.

2957

2958

The Role of the Administrator

The administrator sets policy for every aspect of activity in the long-term care facility. He determines basically what is available in terms of funds, space, equipment and supplies. He should be kept informed of the progress of the activities program. Approval of the administrator is necessary for any major undertakings such as parties, open houses, art shows and similar activities. *He also must approve any activities which involve individuals leaving the facility for tours, outings, picnics, etc. As this may involve insurance and legal policies be sure to allow plenty of lead time.*

Consultants Available to the Supervisor

In carrying out an activities program, questions arise that need answering. Do not guess. Do not assume. Check with the person who is best able to answer your question.

In addition to the administrator, the following people are your consultants.

Physician

It is necessary to obtain a physician's approval (in writing) for including anyone in activities which require active participation. A physician can suggest types of activities which could prove most beneficial, as well as those to be avoided. Any physical or emotional changes you note in an individual participating in your program should be reported according to the policy in the facility.

Social Worker

A social worker can help interpret the causes and effects of a person's emotional problem, as well as suggest methods of involving an individual in an activity which will help overcome the problem. The social worker also can advise on methods for promoting more effective social interaction in group activities.

Charge Nurse

It is the charge nurse's responsibility to know a person's physical condition before and after activity participation. Very often the charge nurse is the most knowledgeable health professional available and therefore should be advised of physical or emotional changes you note in activity participants. In addition, check with the charge nurse prior to scheduling activities to avoid any schedule conflicts.

Occupational Therapist Registered (OTR)

The OTR may be your primary consultant and can evaluate an individual and determine his capacities, abilities and potential, and help you establish specific activities and goals. The OTR shows you specific techniques of remotivation and rehabilitation and answers questions about improving responses of activities participants.

Physical Therapist

Like the OTR, the qualified physical therapist can help you determine which activities are most beneficial in helping an individual to overcome a specific physical handicap or disability. He may suggest adaptations to regular activities which will make them even more beneficial. The physical therapist also may advise you of individual capacities, limitations and potential, and may help you align the goals of your activities program with the goals of the patient's physical therapy program.

Therapeutic Recreation Specialist

The therapeutic recreation specialist advises you of activities which will most interest a person. He also can advise on specific methods of motivating a person to join in group activities, or on adapting the activity to the person's limitations. In addition, he can advise on community and volunteer resources.

The above list is partial. Many others might be on hand and be able to act as consultants. By the same token, fewer than the above may be available. In either case, seek advice from all available. In no case, should you proceed if you

2959

are unable to find satisfactory answers to key questions.

Staff and Volunteers Needed

The range and diversity of your activities program will be shaped to a great extent by the manpower available for its implementation. Because individual needs and requirements vary, as well as participants' general abilities, only an estimate can be made of hours which can be allotted per person per week. What is right for your program and your facility can be determined only by you and your own experience.

Using Volunteers Effectively

(Note: For a fuller discussion, refer to publications of the American Nursing Home Association, the American Red Cross, and the American Hospital Association.)

We cannot overemphasize the importance of having volunteers in an activities program. Volunteers form a necessary and vital link between the community and those in your facility. Volunteers bring with them an unselfish concern which tells those they serve that the community has not forgotten.

You may be called upon to establish and/or direct the volunteer program in your facility. This requires planning. Legal and insurance aspects of using volunteers should be cleared before a program is begun in any way. The administrator, charge nurse and consultants should be brought in on planning and implementation. Policies regarding the facility and volunteers' rights and responsibilities need to be established, written and distributed.

The next step is to recruit volunteers. Know how many are needed. Do not recruit more than you properly can train, supervise and utilize.

Sources of volunteers are: your own personal friends, friends of staff and patients, community groups, religious organizations, etc.

First contact should be made in person or by phone. If not enough prospects can be found, then go to the less selective method of distributing press releases to local newspapers and radio stations stating your desire to obtain volunteers.

It is imperative that each prospect be carefully interviewed and screened. At the initial interview, inquire of the prospect's background—education, physical fitness, other volunteer work and reason for volunteering now. Determine what hours the prospective volunteer will be able to work, and the dependability of transportation. Also, pinpoint the prospective volunteer's areas of interest by using a general list of activities offered by your program.

Most volunteers need initial orientation—to the facility itself and to the rationale and philosophy of your activities program.

Give volunteers a tour of the facility and introduce them to personnel with whom they might come into contact. Discuss what it means to have a long-term illness. Carefully detail standards you expect from volunteers, especially regarding relationships with program participants and being faithful to promised time allotments. Volunteers must be made to feel that many people are depending on them, and, because they are volunteers, that they provide an intangible emotional reassurance to individuals in your facility which paid staff members cannot duplicate. Emphasize that by becoming volunteers, they have assumed a responsibility.

The time a volunteer can give and general ability of each determines the amount of responsibility which can be assigned. For those with limited time or ability, the role of friendly visitor is most suited—mainly talking with people, writing letters, and other person-to-person functions. To maximize beneficial results, try to match areas of volunteer interest with interests of those being assisted.

Before volunteers can take on more responsible duties, they must be trained. This requires understanding and patience on your part. There are, however, practical limits to the duties and responsibilities assigned volunteers. They should not, for example, be given sole responsibility for any long-term activity.

In no case may a volunteer have access to pa-

2960

tients' charts and records. Such materials contain privileged information.

For volunteers to work at their peak, they must be enthused about their work. Interest can be initiated by matching the volunteer's job with areas of expressed interest or past experience. Continually observe volunteer attendance sheets. In case of absenteeism, inquire of the cause. It could mean loss of interest.

To keep interest high, set up long-range goals in terms of short-range projects. In this way the time between project beginning and completion is marked by many small successes. The one or two inevitable failures or frustrations can be overcome easily.

It is also necessary to maintain effective communication and planning. At regular meetings request ideas and suggestions for improvement or change. You might wish to change or increase the duties of volunteers to present them with greater challenges.

Another essential factor in encouraging volunteers is reward. They find satisfaction in the work itself. Nonetheless, volunteers receive a special satisfaction when their ability to help others is recognized. You might wish to honor your volunteers with special ceremonies, a party, or perhaps by the presentation of a small award or present. Remember to thank each volunteer at the end of each day's work.

Developing an Activities Schedule

Effective activities schedules are not subject to hard and fast rules. There are too many variables—number of participants, their abilities and disabilities, staff and volunteers available, equipment and supplies on hand, etc.

Nonetheless, there are certain steps you can take to make your activities schedule as responsive as possible in terms of what is needed and what is available.

Criteria for Selecting Activities

In selecting an activity, either for individual or group participation, there are certain criteria which must be considered. These criteria can be analyzed in terms of what the individual needs and what a certain activity can provide. This analysis can be used for deciding to put an individual into a certain group, or for programming an activity for specific needs. Analysis is broken down as follows:

PHYSICAL CONSIDERATIONS

1. Does the individual need
   a. action rather than position?
   b. repetition of motion?
   c. graduation from easy to difficult, or the reverse?
   d. strengthening?
2. Are the demands of the activity compatible with or adaptable to individual ability regarding
   a. motions required?
   b. endurance required?
   c. coordination required?
   d. dexterity required?
3. Does the activity fulfill the individual's physical needs?

EMOTIONAL CONSIDERATIONS

1. Does the individual need
   a. mental stimulation or calming?
   b. release from tension or anger?
   c. an opportunity for social interaction?
2. Are the demands of the activity compatible with or adaptable to individual ability regarding
   a. degree of complexity involved?
   b. degree of creativity required?
   c. attention span required?
   d. understanding of directions (written and/or spoken) required?
3. Does the activity fulfill the individual's emotional needs?

In addition, each activity should be:

1. compatible with budget and space limitations
2. interesting to the participants involved
3. free from danger and annoyance (such as noise, odor and dust)
4. adaptable to the individual's working position and location
5. flexible to allow for creativity of participant(s)

2961

Once individuals have been matched with activities, all with the physician's approval, begin planning on a large blank calendar for the upcoming month.

Establish who will be available to work with the activities program, on what days, and for how long. This includes yourself, your staff and volunteers. In the case of volunteers, also indicate their areas of interest and competence. In addition, generally be aware of workload and staffing patterns of nursing, food service and maintenance personnel.

Scheduling the Activities

Determine which persons will require individual attention, on what days, for how long, and who will supervise the activities. Coordinate individual activity with nursing and housekeeping routine.

The next step involves scheduling group activities. Ascertain which participants have no time restrictions and which do. For those with time restrictions, limitations will be in the form either of prior commitments, such as regularly scheduled physical therapy, or physical and/or mental disability (the person easily may be fatigued or confused.)

Those whose time limitations consist of prior commitments pose no problem in scheduling. Certain hours simply are not available. For those whose limitations are mental and/or physical, activity scheduling requires careful planning. Activities must be spaced throughout the day so as not to use up all available time and energy at once, thereby creating long periods of boredom for the remainder of the day. At the same time, consider (or consult others regarding) which activities are most appropriate, as one fifteen-minute activity might require more energy than an hour-long activity.

In filling out your schedule for group activity, always indicate amount of preparation and clean-up time necessary. This requires your knowledge of housekeeping schedules, kitchen staff schedules, etc.

Your initial step is to indicate those activities which of themselves necessitate scheduling at certain times in certain areas. As examples, religious activities take place on Sunday, with perhaps regularly-scheduled Bible readings or discussion every Wednesday. There might be a movie scheduled every Friday evening. The facility newspaper, if monthly, requires certain preparatory activities on specific days. Similar regularly scheduled activities might include club and committee meetings, music activities, or a monthly party for all celebrating a holiday in the month.

In addition, there are seasonal activities which require certain planning periods. Such activities are picnics, open houses, outings, political events, tournaments, award functions, etc.

Once all regular scheduled activities have been indicated, along with the personnel necessary for their supervision, other group activities can be planned.

In choosing activities, make selections based on their interest to the participants, time, space and manpower required for their supervision. Once you have determined what types of activities are best (crafts, recreation, etc.), let the individuals select specific activities.

Recreational games are the most flexible, as they can be geared to virtually any situation.

Crafts also are flexible, but usually are limited by degree of difficulty, location and clean-up time necessary. A craft project can be completed either at one sitting, or could require several periods. In case of a long-term project, carefully check that ultimate completion is not delayed by conflict with another activity. Accomplishment is a vital part of your activity program, and its beneficial effect should not be put off and possibly lost.

Finally, do not forget the important individual need for personal activities such as solitaire, puzzles, letter writing and reading. Such activities also are especially useful as "fillers" when supervisory staff is pressed for time.

Integration into Total Facility Program

Once the schedule has been completed, it is subject to review by the administrator and heads of the various departments, or their representatives.

Just as virtually everyone in your facility somehow is affected by your activities program, virtually everyone in the facility has an effect on its success. Therefore, the administrator and department heads should be given the consideration of viewing the schedule and making suggestions.

Your major concerns are to enlist their enthusiasm and support and to avoid conflicts with other schedules. As examples:

Is the time you have selected for cooking activities best for the dietary department?

Are craft area hours convenient for the housekeeping department?

Will sufficient food service and nursing personnel be on hand to help you with a party or open house?

Do not make assumptions which later could cause "hard feelings" or confusing last-minute schedule changes.

Once the schedule has been approved by all affected department heads, have copies made and distribute them to the various departments. In addition, post copies on appropriate bulletin boards.

Remember, an activity which requires use of the supplies, equipment or personnel of any other department must not be undertaken without prior approval of the person in charge of the affected department.

Assigning Volunteers and Staff

Once the program schedule has been approved, it is necessary to implement it. The key to successful implementation, again, is thorough planning on your part, and communication.

First, with planning, each scheduled activity must be divided into jobs. For example, a group activity might require three basic jobs – giving instruction, supervision and clean-up. You might want to give instructions, but then let one or two others supervise, and assist in the clean-up. Another activity might require five or six basic jobs, but they all might be carried out by one person.

Therefore, assign staff and volunteers to jobs within the activity. Clearly indicate who is responsible for what, and who will be supervisor for the activity.

Be as precise as possible in determining time allowances for the performance of each job and each activity.

At the beginning of each day, go over the day's scheduled activities and inquire about the events of the previous day. Request "feedback" from volunteers and staff. Check to see if the time allowance was sufficient. If the activity or job took longer or shorter than planned, make proper adjustments in the time allowance for the future. Ask about any problems that might have been experienced. Ask for ideas on how the job or activity could be improved. Through observation, check if those who supervise or have responsibility for a job or activity are interested and capable. Some might be ready for more difficult duties.

By combining planning for long-range goals in a system of short-range, specified jobs and activities, you will ensure maximum utilization from the manpower available to you.

Records

Records are an invaluable element in the planning, implementation and evaluation of your program.

In addition to budgetary, equipment and supply records, there are four basic forms which can be used.

Your facility's "Patient Care Referral" form (fig. 1) and "Patient Information" form (fig. 2) both contain valuable information which can help define the individual's needs, abilities, disabilities and interests. Information from both should be made available to you as soon after admission as possible.

The "Activities Program Attendance" form (fig. 3) is used to record an individual's daily participation in activities. By checking this form you can gauge the interest of the total population in different activities as well as the overall participation of any individual.

The "Activities Program Monthly Calendar of Events" (fig. 4) is used to indicate the complete plan of activities for the upcoming month. The activities should have been checked previously

at an organizational meeting to ensure that the activities in question create no conflicts with the smooth running of the facility. Such a program should be posted on a central bulletin board and be given to the various department heads, your consultants, and others directly involved, including volunteers. It also can be used in conjunction with the individual "Activities Program Attendance" form to cross-check what specific activities were participated in.

Keeping the Program Effective

The continuing effectiveness of your program requires constant alertness and growth on your part.

Records must be checked on a regular basis to ensure that interest is being maintained by all participants. At the same time, those individuals who have shown steady progress should not be limited. New, more advanced activities should be planned, both in the scheduling and training of personnel involved and in budgetary considerations.

You also should make efforts to increase your own knowledge and skill. Whenever possible, read what literature is available, attend educational or training sessions and visit other facilities to see what other activities supervisors are doing in their programs.

You also might wish to formalize certain programs to give them an independent basis. For example, tournaments might be held, developing into seasonal or even annual events. Award systems might be developed for volunteers and other staff members. By establishing such formalized activities, some planning is made automatic to give you more time for planning and development elsewhere. At the same time, of course, always seek means to improve such activities, as they might tend to become stagnant.

The key to keeping your program effective, therefore, is to make it a constant challenge for individual participants. New projects and activities should be tried. Simple repetition of activities which have been mastered day after day, too often can lead to the very boredom and dullness which the activities program, in large part, is intended to overcome.

Instructions for Selected Activities

Motivating an Individual To Participate

NO INDIVIDUAL SHOULD BE REQUIRED TO PARTICIPATE IN ANY ACTIVITY.

Knowing a person's interests, past or present, does not guarantee that he will want to participate in an activity of similar nature. There are a variety of reasons why he might be disinterested. He may lack confidence, fear failure or being laughed at, or he may just be completely withdrawn into his own problems, real and imagined.

There are several avenues open for you to involve an uninterested individual in activities.

First, you must show enthusiasm and the conviction that the individual can participate on a par with others. If attempts at persuasion fail, and if the activity is of particular interest to the individual in light of his past experience, and present abilities, ask him, for example, to help explain facets of procedure to you. Your own helplessness might encourage him to demonstrate for you. He then might be willing to demonstrate other steps, and, before long, realize his own capabilities and be willing to join in. You also may ask him to help someone else in the activity, acting as an assistant instructor.

Another method of involving a reluctant individual requires investiveness and subtlety. If, for example, an individual wants absolutely nothing to do with any activities and only wants to sit and watch television all day long, you can stimulate his involvement by using his own desires. You might question him about the program he just watched, asking him what he felt about certain characters. You might have several people watch the program and conduct a discussion group afterward. If a game show is watched, you might wish to perform the game show in your facility. In other words, you must find a way of channeling an individual's immediate desires into related activities which eventually can lead the way to more general activities and social interaction.

Remember, it is imperative that an individual's interests be maintained. Initial interest is no guarantee of continued interest. You should attempt to make a program as varied and involving to a person as possible.

To ensure that a participant's interest is being maintained, check his activity record. If there are periods of unexplained absence, it could indicate a lack of interest or perhaps a problem with one member of the group. Ask the individual what the problem is and seek solutions.

Also, be sure to check with staff, volunteers, other program participants and family if the person involved may have mentioned something about a like or dislike in the activities program. Constantly help an individual to participate, to meet challenges, and to succeed.

Teaching an Activity

There are five basic steps in teaching to be followed for either individual or group instruction. The five steps are:

Preparation

It is essential that you be thoroughly prepared for teaching the activity. Know your subject well, be it a craft or a game. Have at hand all the equipment you will need – materials, tools, or recreational necessities such as balls, blindfolds, etc.

Orientation

Explain the purpose or general idea of the activity. If a craft is involved, show the finished object and explain what tools are used and how they are used in making the product. If a recreational activity is involved, explain the goal. For example, in Chinese Checkers, the goal is to move your marbles from one point of a star to another.

Demonstration

Show the procedure. Go through the process step-by-step, explaining what the purpose is for each step. If there are some shortcuts that can be taken, demonstrate them only if the person learning will not become confused. If possible,

2970

incorporate a shortcut into the actual demonstration, showing the one shortcut without demonstrating the normal routine.

Initial Supervision

Once you have demonstrated, have those involved go through the procedure step-by-step, until it is done correctly. You might have to have participants try each step after you demonstrate, then go through the process again.

Summation

Go through the procedures again, have the individuals go through again, and ask for any questions.

There are several "tricks of the trade" which will make the teaching process simpler and more effective.

1. Double and triple check your preparation.
2. If applicable, seat participants in a comfortable position with good lighting for work.
3. If possible, sit beside an individual so that he can see what your hands are doing, hear what you are saying, and does not feel rushed.
4. Give encouragement and honest praise. Some persons are apt to be very critical of their performance and can tell quickly when your praise is insincere.
5. Be patient. If a mistake is made in one of the steps, reteach the step. You may wish to reteach the step for an entire group if you feel several are having a problem with it. Do not demonstrate what might happen if something is performed incorrectly. This only leads to confusion.
6. In case of crafts, have several designs on hand for individuals to work from. If original designs must be created, it could be very discouraging for those unable to create, or who feel their design to be inferior.
7. Have a sense of humor. Keep the situation light. Remind the individual that if he makes a mistake, "so what." At the same time, do not make fun of a person, or of his efforts.

Five Recreational Activities

1. Adapted Bowling

Materials Needed: Table (30 inches high); Masonite sheet (two feet by eight feet); half-inch thick plywood sheet (two feet by eight feet); ten large wax paper milkshake containers; two rubber balls (three inch diameter).

Construction Required: The adapted bowling alley is constructed by nailing or gluing the Masonite to the half-inch plywood. You may wish to embellish the Masonite with paint.

Number of Participants Involved: The number of participants who can be involved is almost unlimited, although it is suggested that the number be kept to no more than fifteen or twenty, depending on the rules you establish.

Rules of Play: The rules of play can vary considerably. In general, participants are in a circle around the bowling alley (fig. 5), the alley being turned to face each individual, rather than having the individual move.

Each person has five turns, one turn at a time in rotation. He throws two balls on each turn. In

FIGURE 5.—Adapted bowling alley and players. Alley rotates to accommodate players.

2971

scoring, a point is received for each pin knocked down, except that twenty points are given if all ten pins are kocked down on the first roll of the ball in any given turn. A total of one hundred points is possible. Participants can play as individuals, or in teams.

2. Shuffleboard

Materials Needed: Eight wooden discs (quoits) (eight inch diameter, 3/4 to one inch thick); four shuffleboard sticks (purchased or made); paint.

Construction Required: *Discs* are simply made in crafts or by a carpenter. Four are painted red, four blue.

Shuffleboard sticks can be purchased or made by affixing to the end of a mop or broom handle a block of wood eight and one-half inches wide by six inches long by one and one-quarter inches thick, one end being made concave to fit outer edge of disc, with the bottom of the shooting end planed to a forty-five degree angle (fig. 6).

Shuffleboard base usually is a floor inside or a concrete surface outside (heavy oil cloth or plastic also can be used). The diagram is painted (fig. 7). Note that length of area can be shortened if necessary.

FIGURE 6.—Shuffleboard stick head.

FIGURE 7.—Shuffleboard diagram and dimensions.

Rules of Play: Four persons play at one time, two being designated the blue team, two as the red. One blue player and one red player are at either end of the court. All eight discs are at one end of the court. Players alternate pushing the discs, first one blue disc, then one red disc, one blue, etc. If the red player is first to play a disc, then blue player on other end of board pushes disc first when play begins at that end of board. Such alternation is necessary as a player may hit opponent's discs out of scoring position with his disc.

Scoring is determined by position of discs after all eight have been played. Discs which are on the line receive the lower of the two scores indicated. The game is complete after 21 points (or whatever specified sum is set) is reached.

1765

2972

3. Balloon Valleyball

Materials Needed: Net (or cord) long enough to be suspended between two walls; large, bright colored, round balloons.

Construction Required: The net or cord must be suspended between two walls at a height of four to four and one-half feet from the ground.

Number of Participants Involved: The maximum number of participants involved is 18, nine to a side in rows of three.

Rules of Play: A like number of individuals is on either side of the net. Play starts when server taps balloon into the air with the object of getting it over the net. If the balloon does not go over the net on the initial serve, two more taps are allowed to other players. If the team which serves fails to get the balloon over the net in three taps, or if the balloon touches the floor, or if the balloon is tapped by the same person twice in succession, the team which is serving loses the balloon and the other side has the serve. No points are scored. If the team which is *receiving* fails to return the balloon within three taps, or if it drops the balloon or has a player touch the balloon twice in succession, then the team which is serving receives a point and serves again. Only the team which is serving is eligible to score points.

If conditions merit, players may rotate position. The game is won by the team scoring 21 points, or whatever number is agreed upon.

4. Relays

A relay is an active group game in which mild competition and team spirit can be developed.

There are several varying types of relays, with the only equipment needed a baton, which could be a cut-off broomstick, a ball or some similar relaying device.

The specific relay which you choose depends on the general physical abilities of those involved. Some relays involve more endurance and/or dexterity than others.

As shown in fig. 8, two teams face one another man-for-man. The baton is moved from left to right, then, once having gone from one end to the other, moves back to its original position. A variation of this relay, demanding a great deal more dexterity, requires that the baton (a shoestring) be loosely tied by the "passer" around the "passee's" wrist. "Passee" then unties the baton and carries out the passer function. As usual, winning team is signified by the one whose lead-off man is first to regain possession of the baton.

FIGURE 8.—In this type relay, the baton is passed from left to right, from one end of the line to the other, then back again. A shoestring-tying variation requires more dexterity.

The relay shown in fig. 9 requires more movement than above, but can be played by less players. The teams are side by side, each lead-off man equidistant from a wall, chair or similar device. The lead-off man takes the baton, moves to the goal, touches it, returns and hands the baton to the next in line, then proceeds to the end of the line. The team whose lead-off man is first to return to the head of the line, wins.

FIGURE 9.—In this type relay, lead-off man takes baton, goes to and touches goal, then returns and passes off baton to next person in line. Lead-off man goes to the end of the line, while relay action continues. Game is over when lead-off man returns to front of line.

2973

5. Group Exercises

Group exercises are used to maintain and promote general physical fitness and mobility. The amount of time spent on exercising depends on the composition of the group involved. Remember that energy expended by an individual must be conserved to provide ability to participate in various activities throughout the day. At no time should you allow an individual to become fatigued. No individual may participate in exercises without prior written approval of the attending physician.

The following exercises can be performed from either a standing or sitting position. Those unsteady on their feet should sit. Each individual needs side space equal to fingertip-to-fingertip distance of outstretched arms.

DEEP BREATHING EXERCISE

Participants inhale while leader counts to four.
Participants exhale while leader counts to four.

HEAD BOWING EXERCISE

On the word "ready," head is in upright position.

On the count of 1, lower head until chin touches chest.

On the count of 2, raise head to "ready" position.

On the count of 3, put head back as far as possible.

On the count of 4, return head to "ready" position.

HEAD TWISTING EXERCISE

On the word "ready," head is in upright position.

On the count of 1, move head to right, right ear approaching right shoulder.

On the count of 2, return head to "ready" position.

On the count of 3, move head to left, left ear approaching left shoulder.

On the count of 4, return head to "ready" position.

SHOULDER SHRUG EXERCISE

On the count of 1, participants raise shoulders.

On the count of 2, participants lower shoulders.

SHOULDER EXERCISE

On the word "ready", arms are by side.

On the count of 1, raise arms in front of body, parallel with feet.

On the count of 2, move arms to the side, perpendicular to legs.

On the count of 3, raise arms over head, palms touching.

On the count of 4, return arms to "ready" position.

ELBOW AND SHOULDER EXERCISE

On the word "ready," arms are by side.

On the count of 1, raise arms in front of body, palms upward, parallel to feet.

On the count of 2, bend elbows and touch finger tips to shoulders.

On the count of 3, return arms to #1 position.

On the count of 4, return arms to "ready" position.

CLOSE AND OPEN HAND EXERCISE

On the count of 1, make fist.

On the count of 2, open hand and spread fingers.

CHOPPING MOTION EXERCISE

On the word "ready," fold hands together on lap.

On the count of 1, swing hands upward over right shoulder.

On the count of 2, return hands to "ready" position.

On the count of 3, swing hands upward over left shoulder.

On the count of 4, return hands to "ready" position.

TRUNK TWISTING EXERCISE

On the word "ready," hands by side if sitting, on hips if standing.

On the count of 1, twist body from waist up to right.

On the count of 2, return to "ready" position.

On the count of 3, twist body from waist up to left.

On the count of 4, return to "ready" position.

TOE TAPPING EXERCISE

On the word "ready," feet are flat on floor.

On the count of 1, left heel remains on floor, raise left toes.

On the count of 2, return to "ready" position.

2974

On the count of 3, right heel remains on floor, raise right toes.

On the count of 4, return to "ready" position.

MARCHING IN PLACE EXERCISE

On the word "ready," both feet are flat on floor.

On the count of 1, raise left foot off floor.

On the count of 2, return to "ready" position.

On the count of 3, raise right foot off floor.

On the count of 4, return to "ready" position.

The following two exercises are used only in a sitting position.

LEG ABDUCTION AND ADDUCTION

On the word "ready," sit with knees about eight inches apart, feet flat on floor.

On the count of 1, spread knees apart.

On the count of 2, bring knees together.

KNEE STRAIGHTENING EXERCISE

On the word "ready," sit with knees about eight inches apart, feet flat on floor.

On the count of 1, straighten and raise left leg.

On the count of 2, return to "ready" position.

On the count of 3, straighten and raise right leg.

On the count of 4, return to "ready" position.

Five Crafts

ALL CRAFTS WHICH TEND TO CREATE DUST AND/OR ODORS MUST BE CONDUCTED IN WELL-VENTILATED AREAS.

1. Woodworking

Woodworking can be as simple as making blocks for children, or as complicated as building a house. When selecting a project, keep the participant's ability in mind. Do not suggest overly simple projects for men with past experience and present ability to complete more involved projects.

In some cases, someone from the facility's maintenance department, from a school industrial arts department or a retired carpenter may be willing to cut out projects for woodworking participants, thereby avoiding expense and exposure to hazards.

PROJECT A: CHILDREN'S BLOCKS

Goal: To produce varying sized blocks for children which will not be harmful if chewed upon

Equipment needed: Sanding block; paint brush; (C-clamp)

Materials Needed: Small pieces of scrap lumber (not plywood); sandpaper, coarse and fine; vegetable coloring or nontoxic paint

Procedure: Using the coarse sandpaper, sand the wood block completely, being careful to smooth all corners and edges and to remove any loose slivers. Repeat the process using the fine sandpaper. (For a person with the use of one arm only, fasten the block to the table by means of a C-clamp.)

Clean the block by brushing.

Color the block with vegetable color or with nontoxic paint. *Do not use any materials which, if swallowed, might prove harmful.*

When 12 or 18 blocks have been completed, bag them in a mesh bag and use as gifts for children of friends or relatives, orphanages, etc.

PROJECT B: LAMP

Goal: To make an attractive lamp that can be used in the individual's room (This project can be long-range, also encompassing other crafts, as done here with "Mosaics—Project A".)

Equipment Needed: Saw; hand drill (brace); bits; hammer; pliers (to strip cord); screwdriver; vice (wooden); sanding block; scissors; paint brush; ruler; pencil; equipment cited under "Mosaics—Project A."

Materials Needed: 1 sheet ¼" plywood (capable of being cut into dimensions given below); 1 piece scrap ½" wood (capable of being cut into dimensions given below); 1 piece scrap 1" pine (at least 8" square); nails; sandpaper (coarse and fine); light fixture (new or old, including extension rod, socket and pull chain, brass rod, coupling, washer, threaded pipe, washer and nut, as shown in fig. 15); electrical cord; plug; felt; white all-purpose glue; paint; materials cited under "Mosaics—Project A."

2975

Procedure: Cut wood into desired proportions, as follows:

¼" plywood—4 pieces, each 7" x 14"
½" wood—2 pieces, each 6⅜" x 6⅜"
1" pine—1 piece, 8" x 8"

Sand outer surfaces of wood to remove any splinters, bumps, etc. Sand edges and corners of 1" pine only.

Taking the ruler and pencil, make small, light marks on the edge of the top of the 1" pine, at the 2", 4", and 6" points. Repeat this for the other three edges. From each of these points on the edge, make a mark at 13/16" toward center. These marks form a perfectly centered outline for one of the 6⅜" squares. (See fig. 10.)

FIGURE 10.—6⅜" square centered and placed on 8" square.

Center the 6⅜" square in the outline you have just made. Nail it to the pine base.

On each 6⅜" square, mark the half-way point of each edge, 3³⁄₁₆". Draw one horizontal line, from point to point, and one vertical line, from point to point, for each 6⅜" square. The perfect center is indicated where the lines intersect.

At the point of intersection, drill a hole with a bit whose diameter is equal to or slightly larger than the diameter of the threaded pipe of the fixture. Do this for both 6⅜" squares, and drill through the 1" pine base for the 6⅜" square which is mounted to it.

Taking your ruler and pencil, draw a line on the bottom of the 8" square from the hole you have just drilled to a point marked at 4" on edge of base bottom.

Mount the base in a wood vice. If a wood vice is not available, use a metal vice with pieces of wood in clamp area to prevent gouging. With a saw, saw a small channel along the line you have drawn. This will form the channel for the electric cord. Then with a ¾" diameter bit, drill a hole ½" deep only in center of base. (See fig. 11.)

FIGURE 11.—Showing channel and fixture well.

Place one piece of the ¼" plywood in the vice, longest edge up. Lay another piece of the ¼" plywood on top, the edge of the top piece being even with the side of the piece in the vice. Nail the two pieces together. (See fig. 12.)

FIGURE 12.—Showing first two sides in vice, nailed.

2976

Place the unattached 6⅜" square in the vice. Put the two pieces of ¼" plywood into position. Nail together (See fig. 13.)

FIGURE 13.—Showing top mounted to two sides.

Place the 6⅜" square and attached 8" square in vice. Nail to the 6⅜" square what has been assembled so far. (See fig. 14.)

FIGURE 14.—Showing base mounted to two sides and top.

Now nail the two remaining pieces of ¼" plywood into position.

The next step would be to decorate the box-like structure. For our purposes, we have chosen to use mosaics, and this is described as Project A, under "Mosaics"—the next section. There are many other possibilities. You will wish to paint or stain the base, however, and now is the time to do so, choosing the desired color.

Once the lamp is decorated, perform the necessary wiring for the light fixture. *If you are using an old fixture, use new cord. Do not use old cord.* The wiring should be done by someone who knows what he is doing (fig. 15).

FIGURE 15.—Light fixture.

Once wiring is complete, insert cord through appropriate holes; place fixture in position with nut and washer at top; slip another washer and nut over base of cord, fasten top and bottom nuts; attach the plug to the end of the cord. Insert bulb and attach shade. (You may wish to make shade another project.) Test the lamp carefully for wiring defects. (For illustration of complete lamp, see fig. 16.)

ALL ELECTRICAL WORK SHOULD BE DONE BY AN EXPERT IN THE MAINTENANCE DEPARTMENT. DO NOT DO IT YOURSELF UNLESS YOU HAVE BEEN SHOWN HOW AND ARE FULLY CAPABLE.

Once wiring is complete, cut out an 8" square piece of felt and, with all-purpose white glue, attach to bottom of lamp base.

2977

2. Mosaics

The use of mosaics is an ancient art form. It can be done in bits of marble, glass, ceramic tile, egg shells, seeds, etc. It allows for great creative expression, but, because some might have trouble creating an original design, useful model designs should be available.

PROJECT A: CERAMIC TILE MOSAICS

Goal: To produce a mosaic design on a lamp made in woodworking project, prior to electrifying the lamp

Equipment Needed: Sanding block; pencil; ruler; empty coffee can; brush; soft cloth; canvas bag; hammer

Materials Needed: Sandpaper (coarse and fine); surplus ceramic tiles (not glazed) in several different colors; white, all-purpose glue; grout; wax

Procedure: Sand surface on which mosaics will be placed. (This already has been done in the case of the lamp.)

Trace desired design on wood, determining how much of any one color is needed.

Take scrap ceramic tiles of one color in desired quantity and place in canvas bag. Smash tiles with hammer, being careful not to break tiles too small. Remove tiles from bag. Repeat for other colors.

Making sure the surface is clean, place a small portion of the total design into place. Once it is determined that this is the design desired, glue pieces into place with white, all-purpose glue. Repeat for total design, one small area at a time.

Once all pieces of ceramic tile have been glued in place, top included, mix grout in empty coffee can. Mix grout until it arrives at a creamy consistency. (Directions are on package.)

Using a brush, brush the grout over all areas where mosaics have been placed, being especially careful to get the grout into spaces between pieces. Get out all air bubbles. Let grout dry.

Once the grout is dry, wipe the entire design with a clean, soft cloth, getting grout off all mosaics, leaving it only between pieces. Wipe until smooth.

Now apply wax and polish. A finished lamp is seen in fig. 16.

FIGURE 16.—Completed lamp.

PROJECT B: SEED MOSAIC

Goal: To reproduce a favorite picture in seed mosaics

Equipment Needed: Tracing paper; pencil; ruler; carbon paper; brush; tweezers

Materials Needed: White all purpose glue; clear plastic spray; heavy cardboard; various color seeds depending on colors to be used. Some seeds include: bird seed, various types; split peas; pistachio nut shells; celery seeds; sunflower seeds and shells; etc. Note: Rice can be dyed many different colors, if desired. Mix a small amount of vegetable coloring and water together. Drop in rice, a few grains at a time. Remove with a slotted spoon. Blot on paper toweling, and let dry on waxed paper.

Procedure: Place tracing paper on smooth surface and mark off in squares. Place marked paper over photo or magazine illustration, etc., to be copied. Trace outline. (See fig. 17.)

If figure is to be reduced, or enlarged for mosaic, mark off paper in squares corresponding to new size desired. For example, if the seed mosaic is to be twice as large as the picture

2978

from which it is taken, and if ½" squares originally were used, make up new paper with 1" squares.

The design is transferred from one piece of paper to the other block by block (fig. 18).

FIGURE 17.—Showing traced picture and square grid.

FIGURE 18.—Showing transferring of small to large.

Once the desired design is done in correct size, place carbon paper, carbon side down, on the surface on which the mosaic will be placed. Place the paper with the design over the carbon paper, and, with a dull pencil, sketch the outline of the design. Do not trace squares.

Once the design has been transferred to the surface, select a small area near the center. Cover area with white, all-purpose glue, and, using only one color at a time, place seeds in position with tweezers. Repeat for entire project, one area at a time.

Once the project (fig. 19) is complete, let dry thoroughly. Spray with several coats of clear plastic, letting one coat dry before applying the next. *Note: Be sure that spray is applied only in extremely well-ventilated areas, preferably outside.*

Once completed, frame as desired.

FIGURE 19.—Showing dog of seed mosaic.

3. Simple Quilts

Goal: To produce a multi-colored, tufted laprobe 45" x 70"

Equipment Needed: Tapestry needle size #18 or #19; embroidery needle size #5 or #6; scissors

Materials Needed: 252 6" square pieces of nonravelling, colorfast, washable, opaque material, all material of the same weight; #3 or #5 pearl

cotton thread; embroidery thread or nylon sock and sweater yarn; old nylon hose.

Procedure: Determine pattern. For laprobe, 45" x 70", 126 5" squares are needed. Determine what color these squares are to be. Make one square at a time.

To make a completed 5" square, cut out two 6" squares of the same material. On the face of each square, with a piece of chalk, mark the center.

Turn the two pieces of material so that the outside faces are touching. Using a small running stitch (fig. 20), start sewing two inches from right corner of one side, turn corner, sew three complete sides, and then sew one inch of side where two inches already have been completed, leaving approximately a two inch opening on that side. (See fig. 21.)

Once sewing is complete, clip corners.

FIGURE 20.—Running stitch.

FIGURE 21.—Showing completed first-stage sewing and clipped corners.

Turn rightside out.

Take one old, clean nylon stocking, gather down to the toe, and insert into quilt square through opening, placing the nylon into the center of the square.

Thread three strands of nylon sock and sweater yarn through large tapestry needle. Take one stitch in marked center of square, securing stocking. (See fig. 22.)

FIGURE 22.—Showing center tacking stitch.

Tie the thread in a square knot and cut.

Close the two-inch opening with a blind stitch.

Once the total number of required squares have been made, crochet or button-hole stitch (fig. 23) them together using one strand of the yarn used for tacking, #3 or #5 pearl cotton thread or embroidery thread.

FIGURE 23.—Buttonhole stitch.

2980

4. Simple Pom-Pom Animals

Goal: To make a simple, pom-pom owl

Equipment Needed: scissors; compass

Materials Needed: yarn; scrap felt; thread; white, all-purpose glue; cardboard

Procedure: With a compass, draw a circle three inches in diameter on a piece of cardboard. Using the same center, draw another circle one inch in diameter. Cut out center one-inch circle. Cut out three inch circle. This gives you a doughnut-shaped piece of cardboard. Duplicate using disc as your guide.

Repeat the procedure above, except outer circle is 1¾" in diameter, with inner circle being ¾" in diameter. Make two. Make a slit in each disc. (See fig. 24.)

FIGURE 24.—Showing discs with slits.

Place the two large discs together, the slits being 180 degrees from one another. Wrap yarn through (approximately 110") and around discs until no more can be wrapped. (See fig. 25.) Repeat this procedure for the smaller discs (approximately 85").

Once no more yarn can be fit, insert the scissors between the discs, and cut all the way around the edge. Separate the discs a little and, with a piece of heavy-duty thread, secure the yarn in the center, leaving enough extra to tie the pom-poms together. (See fig. 26.) Repeat for the smaller disc.

FIGURES 25 & 26.—Yarn is wrapped around disc until no more can fit. Yarn then is cut and discs spread.

Once both pom-poms are secured, remove discs. With the excess thread, tie the two pom-poms together (fig. 27).

With scissors, trim larger pom-pom to give it a slightly oval shape and flatten front of smaller pom-pom "head." (See fig. 28.)

FIGURES 27 & 28.—Pom-poms are tied together and trimmed.

2981

For the eyes, cut out two large, dark circles of felt. Thread a needle with piece of yarn. Knot one end, insert needle through center of felt, and run through head. Repeat for other eye, and tie the two ends of the yarn together in the back of the head. Cut off excess yarn. (See fig. 29.)

For the beak, cut out a diamond-shaped piece of felt and fold. Use same procedure as for eyes, with knots appearing at either side of beak. (See fig. 29.)

FIGURE 29.—Eyes and beak mounted to pom-pom head.

Owl now can be attached to a handbag or blanket, or may be made free-standing by flattening bottom or by attaching to simple felt base.

5. Decoupage

Goal: To make an old metal tray into a once-again useful, decorative piece

Equipment Needed: sanding block; scissors; paintbrushes; sponge

Materials Needed: old metal tray; old greeting cards; tissue paper; pencil; sandpaper (fine); emery cloth (fine); steel wool; white, all-purpose glue; rubber cement; paint; clear deck varnish; turpentine

Procedure: Select and cut out design materials.

Make sure that the surface of the tray is clean and smooth. Use steel wool, sandpaper, emery cloth to remove any rust, flaking paint, etc. Choose the background color and select a corresponding flat paint. Paint the surface to be decorated. Let dry 24 hours, sand smooth, apply another coat. If desired, repeat again. After the final coat has been applied, and has dried for 24 hours, prepare the surface by rubbing with a damp emery cloth, fine grade.

With the tissue paper, outline the surface to be decorated. Place cutouts on paper, moving them into an appealing arrangement. When satisfied with an arrangement, dot the back of each cutout with rubber cement and place on outline. If it is satisfactory, prepare to mount the cutouts on the tray.

Brush the back of your first cutout with a thin coat of white, all-purpose glue. Place the cutout in position. Press it to the tray with a damp sponge, moving the sponge from the center of the cutout to the edges. Repeat for all cutouts, one at a time.

When all cutouts are glued, you are ready to seal them to the tray. Mix clear deck varnish with sufficient turpentine so that it flows easily and evenly. Seal the surface of the cutouts using a soft, flat brush. Let dry 24 hours. Thereafter, apply as many coats as necessary (from five to fifteen) to completely seal the cutouts so no edges can be felt. Wait 24 hours between application of each coat. When the final coat is applied, wait 24 hours and sand with very fine sandpaper or emery cloth until the surface is smooth.

Councils and Committees

Through participation in councils, committees and clubs, a significant degree of independence, purpose and sociability can be restored to individuals.

With councils and committees, the emphasis is on individuals having a role in the decision-making process. Committees and councils allow individuals to have an effect on what is going to be undertaken. Many facilities have had excellent results by giving individuals a voice in the running of the activities program.

An activity committee's role would be supple-

2982

mentary to your own. For example, a committee might suggest a specific date for an open house, or what to give as an award or gift, or what movies are to be shown, etc. In other words, the overall planning is still your responsibility, but determination of some specific detail is left up to those who are most affected by that detail.

As in any close community, there are bound to be petty jealousies, hurt feelings, leaders and followers. In this light, it is best if all individuals are somehow involved in activities committees. You might wish to establish an awards and gift committee, to determine what type of award should be given a volunteer or guest speaker; a movie committee, to select what movies should be shown; a decorating committee, to work on decorations for a party or open house; a party committee, to select specific dates for certain events and possible themes, and other committees with overall scope as wide and as varied as your overall program.

Selection of the people to work on the committees is best made on a random basis—perhaps by pulling names from a hat, with a specified number to work on each committee. Trading committee posts among and by individuals should be allowed. Bear in mind that there may be those who might not wish to participate in committee work due to other obligations such as clubs, or crafts projects, etc. Those who do not wish to participate because they feel inferior or afraid that they could not contribute, however, should be urged to join in, if only to watch. Nonetheless, do not force an individual to do something which he absolutely does not want to do.

Meetings of the committees can vary, according to the nature of the committee's purpose. If possible, the meeting should take place in a special room which affords quiet and privacy. A chairman who is able to do the job and, preferably, who has not chaired a meeting in the recent past, should be selected by committee members at each meeting.

Some set of rules should be observed, based more on politeness and common sense than strict parliamentary procedure. Individuals should not interrupt a speaker, and individuals must speak in turn.

You or a member of your staff or a volunteer should be present at meetings to answer any questions, give assistance where necessary, and to observe. Do not interfere or run the meeting. To as great an extent as possible, committee meetings are activities where individuals do for themselves.

Depending on the committee's realm, some decisions should be referred for vote by all concerned. For example, in selection of movies, committee members might select ten movies from a list of one hundred, then have all individuals in the program vote to determine the five most desired from the list of ten.

Be cautious in dealing with committees. Outline their responsibilities carefully so you do not have to override their decisions. You might wish to make general suggestions or advise that a potential committee decision might be contrary to facility regulations. If you must veto a committee judgment, do so as mildly as possible and with full explanation. Remember, committee activity is not a game for those involved. If a committee is established properly it is engaged in earnest, serious work and should be treated accordingly.

Clubs

Unlike councils and committees, clubs composed of individuals in the facility usually do not engage in decision-making.

Clubs are composed of persons with interests in common, such as coin or stamp collecting, gardening, volunteer work, welcoming new individuals to the facility, etc.

Establishment of a club is your responsibility. You might wish to check over records to see where interests lie, or perhaps compose a list of possible clubs, questioning individuals about their interest in specific areas.

Club meetings usually take place on a regular basis. Meetings should be open to all who might wish to observe or participate, however, since some may have a latent interest which observance of a club meeting might encourage them to develop.

Club activities involve reading or suggesting books and magazines to read, reading aloud, discussing unusual facts associated with the

2983

subject at hand, or displaying, as with coins or stamps, certain rarities in the possession of individuals.

Clubs also give members the opportunity to expand their activities and involve the community. Guest speakers can be invited in from the community at large, trips can be made to museums or other locations pertinent to the club's interest, and clubs in the community with interests complementing those of club members in the home might be encouraged to meet occasionally in the facility or to invite facility club members to general meetings in the community.

Your role in club activities, aside from being the person responsible for originating them, is primarily as an observer. Again, the goal is to have club members do and act for themselves. You or a representative from your office should be on hand, however, to answer any specific questions or respond to any specific requests.

In general, it can be said that measures to give individuals roles in independent thinking encourage them to assume roles in the community at large where independent thinking and decision-making are necessities for existence.

Facility Library

Most people enjoy reading and should have access to current publications—periodicals and books. Reading stimulates mental alertness and can provide the basis for many beneficial forms of social interaction.

In establishing a library for those in your facility, consult your community librarian. She may know the reading tastes of many in your program, as well as being familiar with the theory for establishing a simple, yet effective distribution control system.

You might be able to get a direct stop at the facility from your community library's Bookmobile, if available, or a bulk delivery of books from the library for your participants' use on a monthly or six-week basis.

Some magazines may be subscribed to, although this can lead to expense and perhaps some incidents about who is to keep which magazine for how long. Many homes have found great success when volunteers bring in recent (one week old) editions of popular magazines, enabling individuals to have their own personal copy of a favorite publication.

Bookcases should be placed where staff easily can supervise take-out and return procedures. Hours must be established. One or several patients may wish to volunteer their services as librarian(s).

In case of partially-sighted or blind individuals, Talking Books, large print and Braille books are available from the Library of Congress, Division for the Blind and Physically Handicapped (1291 Taylor Street, N.W., Washington, D. C. 20011 or from a regional office and other sources.)

Patients no longer able to read but who are sighted enjoy primarily pictorial publications such as *Look, Life, Ebony,* etc.

Facility Newspaper

One of the most absorbing and rewarding activities for individuals is the writing and publication of a facility newspaper.

Because there will be some expense involved, budgetary considerations and approval must be obtained from the administrator. Outside of items such as writing paper, pencils, art supplies, scissors, etc., the main cost will be for the actual printing itself.

As in the formation of the club, it is up to you to generate initial enthusiasm for the project by inquiring of individuals if they would be interested in the project. If there is a sufficient show of interest, try to encourage more to join in as a job of one sort or another can be found for almost all wishing to participate. Talents especially needed are writing and illustrating. Some of those areas where no real previous experience is necessary includes pasting up, reporting, distributing, and selection of those stories to be used and those which can be omitted. Check through records to see if there are those who might have had past experience or ability to assist. Encourage such a person to join in, possibly by asking for an evaluation of the overall plan for the publication.

2983

2984

Once you have the names of those who want to participate, call an organizational meeting. At this meeting it might be possible to have a guest speaker, a writer for a local newspaper, perhaps, to outline some of the major areas of concern and some of the work that will have to be done. If it is impossible to get such a guest lecturer, you could have an interview with a writer at his place of work to ask pertinent questions. Relay the information to those attending the initial meeting to give them an opportunity to decide where their maximum ability or interest lies.

It will be up to you or a volunteer or staff member to assist in the development of the newspaper. A list of possible initial assignments could be made up and discussed at a second organizational meeting. There will be a need for writer/editors; illustrators; reporters, who only have to bring in notes or verbal information; columnists to write continuing features such as "I Remember When" or "Comment on Current Events;" layout designers, and other positions about which you should obtain more information.

The scope of the newspaper should be facility-wide. Ask for the cooperation of various department members to act as correspondents, sending in notes about events or happenings in their departments.

The main emphasis of the newspaper will be on those you serve. Some of the items that could be reported include birthdays; new arrivals; coming events, such as parties and holiday celebrations; "patient of the month," selected on random basis giving a biography and current interests of an individual, poetry, as well as any articles pertaining to any major changes that will affect daily living in the facility. Other possibilities include welcome to new volunteers and employees, employee birthdays, words from the administrator, reports from the various departments, etc. Also possible are surveys which analyze individuals' views of certain issues, and compilations of unusual past experiences.

The style of writing for the facility newspaper need not be the formalized newspaper jargon that you read in daily newspapers. The style can be casual, almost as if writing a letter. Nonetheless, it is important for articles of any length to be well outlined so they maintain their interest and readability.

Selection of articles can be made by several editors who can pass judgment effectively. Final typing can be done by a volunteer or member of the facility's clerical staff. Actual paste-up, if required, can be done in a craft area.

The cost of printing the newspaper should be investigated before beginning the project. It would be best to consult a local printer, explain the situation and ask his advice. Chances are he would be more than happy to cooperate. In addition, you might investigate the actual cost of printing on the facility's duplicating or mimeograph machine. Also check with a local high school as many have print shop facilities. Local community organizations might have printing equipment you can use free of charge. It is up to you to ascertain the best and least expensive means of printing as this will be the most expensive part of the project.

Should the newspaper be printed "in house" on a duplicating machine, the originals should permit easy reading by those who are visually impaired. You can use all upper case letters, SUCH AS THIS, or, if there is an IBM Selectric Typewriter in the facility, you might be able to secure a special large type speech font.

Distribution of the newsletter also can be carried out by individuals in your care. Copies should be given to all in the facility, including staff, volunteers, etc., to visitors. Copies also could be sent to families of individuals in the facility.

Remember, the finished product does not have to be the finest piece of work ever done. It is not expected to compete with a daily newspaper. But to those who participate in its publication, a newspaper of their own is an achievement of immense pride and satisfaction.

Rhythm Band

The rhythm band is an excellent activity to promote both mental and physical exercise. Much of the equipment can be made in your facility as craft projects, and other materials can be purchased very inexpensively or donated to your facility.

2985

To initiate enthusiasm, determine what songs are favorites for individuals. Secure records of one or two "peppy" songs and with one or two instruments, indicate how the rhythm band functions, picking up the beat of the song. Invite several to try.

You can begin with a very few persons, eventually encouraging all able to do so to join in. A phonograph and records are needed.

Some of the manufactured instruments that can be used include:

Bells (obtained from a dime store)

Drums (toy military drums and bongo drums)

Cymbals (small)

Maracas

Tambourine

Triangle

Several of these manufactured items can be made in craft activity as well as other items used for the rhythm band. These include:

Bells (sew 10 "jinglebells" to a piece of grosgrain ribbon)

Chop Blocks (glue fine sandpaper to one side of two small blocks—rub together)

Cymbals (two pot lids)

Drum (oatmeal box covered with paper and shellac; drumstick—12-inch dowel with cork fishing bobber glued to one end)

Rattles (sealed bandaid box filled with pebbles, or; pingpong paddle with soda caps loosely nailed, two-to-a-side, or; two aluminum tart pans, filled with metal buttons, glued taped or laced together with popsickle stick handles)

Rhythm Sticks (two ten-inch pieces of dowel)

Tambourine (punch eight holes in the rim of an aluminum pie pan and string metal buttons (three in a group) through holes)

Xylophone (glass bottles filled to various levels struck by a spoon)

In addition to performing regularly, the band can be a center of attraction at parties, requiring posters to be made, etc. To keep interest high, play to different records, encourage individuals to change instruments, or try forming a marching rhythm band if enough band members are ambulatory. A high school music instructor might be willing to give you consultation.

Gardening

Over the years individuals in long-term health care facilities have shown continuing interest in gardening. In essence, gardening involves the responsibility of caring for a form of life, and a chance for the creation of visual beauty.

Gardening itself can range from simple to complex. It might involve a single plant in an individual's room, a window box, or, as happens in many instances, planting and upkeep of flowers on the grounds of your facility.

In beginning general gardening activities, a variety of equipment must be on hand, depending on the scope of the project. In selecting the necessary materials, much of which probably is in possession of the maintenance department, consult with individuals in the program who have had experience. Let them make listings of suggested tools such as trowels, hoes, etc., as well as supplies such as peat moss, and of course, the flowers themselves.

If the budget allows, plants in each individual's room, cared for by the individual or with the help of an experienced "gardener" not only brighten rooms, but might spark a new area of interest or some degree of social interaction where neither have existed before.

Scheduling gardening activities poses no problems, especially during the summer months or in areas where outdoor activity is possible year-round.

The activity suggests many other possibilities.

A gardening club easily could be established, where literature could be read aloud, movies shown, lectures given by florists or horticulturists, etc. Also possible are trips to botanical or horticultural gardens or trips to museums with botanical or horticultural exhibits. During open house, inspection of the facility's gardens is another possibility. Nor should you overlook the possibility of newspaper publicity for individuals who might enter contests or experiment with new strains of flowers. Contact with the community's garden club or society also is encouraged.

Therefore, as with many specialized activities, gardening can generate widespread enthusiasm and enjoyment for those individuals involved

2986

in the actual performance, as well as in the many activities directly associated with it.

Religious Activities

NO ONE SHOULD BE FORCED TO PARTICIPATE IN ANY RELIGIOUS ACTIVITIES

Religious activities are of particular importance to most people. In establishing programs in your facility, consult with community religious leaders of all faiths. Be sure to check with the administrator to determine facility policy regarding seeking of converts by groups which emphasize proselytizing. This policy should be relayed to those whom you consult.

Services

The basic religious activity is the conducting of services. One religious leader, or perhaps several in rotation, might be willing to come to your facility on Sunday to conduct nonsectarian services. If there are distinct groups of one religion or another, special services might be held, followed or preceded by general, nonsectarian services. If there are several groups, several corresponding religious leaders might be willing to come out to the facility to conduct special services. *It is important, in the conduct of services, that no one is overlooked and that no one is forced to participate.*

Another possibility, and one that is especially beneficial, involves one or several members of a religious group being picked up by relatives, friends or volunteer members of the congregation to be taken to community services. This possibility easily is investigated by discussing the matter with volunteers in your home, or by calling the head of the affected congregation.

Still another possibility, especially for facilities whose patients are predominantly of one particular faith, would be the holding of outdoor services with members of the regular congregation being invited—bringing the community to the facility. Such activities could be followed with refreshments and perhaps an open house.

Other Activities

In addition to services, there are many other activities related to religion, including:

Bible Classes—Representatives of many religions would be willing to come to the facility in the middle of the week, or perhaps several times a week, to conduct Bible readings and explanations of Biblical meanings.

Bible Study Group—A Bible Study Group similar to a club, and could be led either by a representative of a religious group, or by a patient. Such a group need not be affiliated directly with any one particular religion or another.

Church Volunteer Work—Many volunteer projects might be undertaken for church-related charities, such as an orphanage, hospital, etc.

Church Social—Individuals from the facility might be taken to church socials, or might be able to have a church social in the home.

Church Fraternal Groups—Individuals from the facility might be encouraged to join or to maintain membership in religious fraternal groups affiliated with their religion, such as the Knights of Columbus or B'nai B'rith.

Remember, the possibilities for related religious activities are almost endless. Discuss ideas and possibilities with many religious leaders in the community. They will be happy to help you to develop a meaningful program for all those in your facility.

DO NOT OVERLOOK ANY INDIVIDUAL DO NOT IGNORE HIS PREFERENCE.

2987

Some Community Resources

The following listings should be used to stimulate your own thoughts and the thoughts of others. This list is not the be-all and end-all. Use it for ideas, for, in the last analysis, ideas are your greatest resource.

Crafts

FROM YOUR LONG-TERM CARE FACILITY

Scrap yard goods, tongue depressors, tape, tin cans, empty Clorox bottles, tissue paper, milk cartons, paper cups, gauze, cotton batting, etc.

FROM THE STAFF, INDIVIDUALS BEING CARED FOR AND THEIR FAMILIES

Scrap yard goods, old nylon hose, old jewelry, old greeting cards, old books, old furniture, old picture frames, old toys and dolls, etc.

FROM THE COMMUNITY AT LARGE

Surplus goods, such as scrap lumber from a lumber yard, scrap leather from a shoe and glove manufacturer, scrap yard goods from fabric retailers, scrap yard goods and old burlap bags from mills. Also donations from clubs, organizations, civic groups, etc.

Games

FROM YOUR LONG-TERM CARE FACILITY

Tables, chairs, brooms, specific games, as well as prizes such as fruit, small trophies, etc.

FROM THE STAFF, INDIVIDUALS BEING CARED FOR, AND THEIR FAMILIES

Games no longer used, prizes, ideas for games, tournaments, etc.

FROM THE COMMUNITY AT LARGE

From retailers and community groups, the donation or loan of special equipment, and the donation of prizes.

Other Activities

FROM CHURCHES

Religious services, Bible readings and discussions, lectures, ice cream socials, missionary groups, etc.

FROM CLUBS AND ORGANIZATIONS

Lectures, assistance in project development, meetings, community drama groups, etc.

FROM MUNICIPALITIES

Visits to the museum, zoo, planetarium, aquarium, civic concerts, libraries (books, movies, records), public schools (music and drama groups), city recreational programs, parks (fishing, picnics), etc.

PRIVATE INDUSTRY

Sheltered workshop, field trips, movies, etc.

EXHIBITIONS

Sports, art, flowers, automobiles, etc.

PRIVATE SCHOOLS

Dance recitals, judo and karate exhibitions, band recitals, etc.

Creative Use of Odds and Ends

This list is very partial and is used to illustrate some possibilities for the creative use of odds and ends. The possibilities number in the hundreds of thousands, limited only by your own imagination and inventiveness.

BOTTLES (plastic and glass)

paint containers, vases, lamps, desk sets, piggy banks, games (bowling pins and bean bags), door stops, bubble bath containers, paper weights, dolls.

BROOM HANDLES

playing pieces for games (checkers), table legs, toy wheels, handles (old tools).

BURLAP (ravelled and dyed if wanted)

foundation (for rugs, handbags, and pillows), place mats, wall hangings, colonial door mats, braiding (rugs), block printing.

CANS

vases, desk sets, pin cushions, kitchen utensils (funnel, scoop, cutter), toys, foot stools.

CARDBOARD

posters, shuttles for weaving, picture and puz-

2989

zle mounting, toys, waste baskets, patterns, small frames.

CARPET

ravelled and woven, doll house rugs, door mats.

CHRISTMAS AND GREETING CARDS

applique on bottles, tinware and woodenware, bead chains, flowers, jigsaw puzzles, scrapbooks, posters, decorations.

COTTON (batting)

stuffing for toys, quilts, decorations.

COTTON (cloth)

applique, dolls, aprons, slippers, rugs, quilts.

EGG SHELLS

ornaments, mosaics.

FELT

stuffed animals, applique, wall hangings, bookend silencers, backing for ceramic pieces.

FURS

slippers, doll dress trimmings, toy animals.

GLASS

tea tiles, mosaics, paint pallets.

LEATHER

book marks, hinges, containers (tobacco, knives, change), parts for toy animals.

LINOLEUM

block printing, mosaics, doll house furnishings.

MAGAZINES AND CATALOGS

resource material (questioning advertisers about films available, etc.), paper mache, scrapbooks, patterns, wastebaskets.

MARBLES

mosaics, jewelry.

NEWSPAPERS

paper mache, shakers and fly fans.

PLASTIC BAGS

Christmas wreaths, poodle dogs, weaving strips.

POOL CUES

furniture legs, curtain rollers, mallets.

SANDPAPER

clop blocks (rhythm band), match scratchers.

SPOOLS

spool animals and dolls, wheels for toys, beads, spool knitters.

STOCKINGS (nylon and cotton)

stocking animals, rugs, stuffing for toys and pillows, spool knitting.

STRING

knitting, knotting, curtain pulls, fringe, washcloths, colonial mats.

VELVET

greeting cards, box linings, pictures, doll clothes, applique, rugs.

WALLPAPER

bookbinding, covering boxes, vases (covering), lamp shades, patterns, paper mache, posters, jigsaw puzzles.

WOOL

quilts, rugs, bedsocks, animals.

WIRE

coat hangers, fly swatter stems, armature (clay sculpture), flower stems, jewelry.

WINDOW SHADES

canvas for painting scrolls, patterns, bookbinding.

WOOD

games, shuttles, bean bag boards, foot stools, bread boards, basket bases, bird cages, flower boxes, frames, toys, bookends.

Companies That Furnish Films

To obtain the names of film distributors near you, consult your Yellow Pages under Motion Picture Film Libraries and Motion Picture Film Distributors. If you are located in a rural area, simply ask an operator in the nearest large urban area to consult the Yellow Pages for you. She will be happy to perform this service.

One major source of all type films and audio-visual equipment is your own community library, nearby college library, or nearby city

2990

library. Your librarian, or local photographic equipment supplier also may know a community camera or movie club whose members might be willing to show and discuss some of their own films.

In addition to "regular" movies, check into industrial films. These motion pictures are produced for organizations of all types and tell stories pertinent to each organization. The possible list of subjects is as varied as man's activity has been, is, and will be in the future. Most of these films are modern, in color and available free.

Literally thousands of organizations have had films made. It might be a good project to gather information on the availability of such films. Some companies producing them are virtually all those listed on the New York and American Stock Exchanges; telephone companies, airlines, health associations such as the American Cancer Society; colleges and universities; insurance companies; museums; foreign embassies; religious organizations; nationally based civic associations and organizations; all branches of the Federal Government, such as the Public Health Service, National Medical Audiovisual Center, Communicable Disease Center, P.H.S., Atlanta, Georgia; NASA; the Atomic Energy Commission, etc.; tourist bureaus of large cities; state farm extension services; local agricultural clubs; trade associations, and, of course, your local library.

When writing to these organizations, address letters to the Public Relations Director, or the Public Information Officer. Request a listing of films available, how shipping is arranged, etc.

Equipment and Supply Companies

To obtain equipment and supplies, consult your local Yellow Pages, as well as those of nearby cities, under headings such as "Arts and Crafts Supplies," "Hardware," "Hobbies," "Lumber," and "Sporting Goods."

When purchasing, shop around. Consider availabilities of services if needed as well as price.

For lists of suppliers on a national basis, write to the following and request lists of suppliers:

American Occupational Therapy Association
251 Park Avenue South
New York, New York 10010

National Recreation and Park Association
1700 Pennsylvania Avenue, N.W.
Washington, D. C. 20006

2991

Appendix A

Common Health Problems Requiring Long-Term Care

Arteriosclerosis

Blood vessels are the pipes of the body's plumbing system. The heart pumps blood through the arteries to all parts of the body. Blood distributes oxygen to the body's cells. Blood is returned to the heart in veins. The arteries have thicker walls than veins and they pulsate. These arteries can be affected by a disease called arteriosclerosis. Arteriosclerosis also is known as "hardening of the arteries." It is characterized by a fatty substance in the blood sticking to the inner wall of an artery (fig. 30).

The fatty lesion on the inner wall of the artery causes a thickening of the other two layers of the artery – the middle wall and the outer wall. This causes arteries to lose their elasticity and become rigid, known as "pipe stem" arteries.

This disease can affect arteries in any part of the body. When it affects a certain part of the body or organ, the name of the affected area or organ is placed first. For example, cerebral arteriosclerosis signifies arteriosclerosis in the arteries of the brain.

2992

1ees

The causes of arteriosclerosis are not completely known, but it is known that smoking, overweight, diabetes, and high blood pressure make the disease proceed faster. With proper care an individual with this disease can live many years, leading an active, useful life.

An activities program, including some physical activity, can provide physical and mental stimulation. Routine activities can be helpful to the confused or forgetful individual.

Remember, any secondary problems, such as a heart condition or diabetes, etc., also must be considered before any type activity is entered into.

Figure 30.—Arteriosclerosis results when fatty substances build up on the inner wall of an artery.

Heart Disease

There are many different types of heart diseases, caused by many different conditions. Many of these conditions are caused by interruption or slowdown of the flow of blood to the heart, and, because the heart is the body's blood "pump," this can result in changes in the flow of blood.

Although many diseases of the heart are gradual, taking place over the years, symptoms can come on suddenly—completely unexpectedly. As Activities Supervisor you should be aware of some of the signs of heart problems. They include dizziness, unusual tiredness or fatigue, nervousness, rapid heart beating, difficult breathing, weakness, blueness of the skin, lips and fingernails, pains in the chest or the left arm, headache, urinary complications and insomnia. Many of these problems are not always caused by heart disease, but, should you note any of these symptoms, report them to the charge nurse or physician immediately.

An activities program can help heart disease victims through encouraging relaxation, mental stimulation, and, where appropriate, by encouraging the individual to adjust to his limitations. The person with a known heart condition should not participate in physically active activities, or those requiring raising the arms more than chest high, without the written approval of the attending physician.

Stroke

Stroke is also referred to as cerebral vascular accident or "C.V.A." A stroke occurs when the flow of blood to the brain is somehow interrupted.

The brain is divided into several areas. The cerebrum is the major area and it controls most of the functions of the body. In turn, the cerebrum is divided into several areas, or zones, each zone having control over a specific function of the body (fig. 31).

Figure 31.—Zones of the cerebrum.

If the flow of blood is interrupted to one or any number of the control zones of the cerebrum, the part of the body over which the affected area has control cannot function. The flow of blood can be interrupted by blockage, as caused by arteriosclerosis, or by a blood clot, or by a hemorrhage, where the artery breaks and the blood flows out, or by compression caused by a small tumor pressing on the outer wall of the artery causing it to close (fig. 32).

2993

Figure 32.—If the flow of blood to a zone or zones of the cerebrum is interrupted, by blockage, breakage or compression, the part of the body controlled by that part of the cerebrum is affected.

There are many precautions that must be observed in the care of the stroke patient which can be explained to you by a physician or nurse.

An activities program can provide much for the stroke victim in the way of rehabilitation. The individual affected may feel like an outcast, and the activities program can overcome this through social interaction. Activities also will encourage speech and self-care in functions of daily living, maintain or increase strength and coordination in unaffected as well as affected areas, and increase self-confidence through mastering activities geared to abilities.

Mental Illness

Mental illnesses are "organic" or "functional."

Organic mental illness refers to mental disorders which result from physical damage to the brain, from cerebral arteriosclerosis, infection, poisons in the body such as alcohol or barbiturates, severe blows to the head, etc. Older persons, because of lowered resistance, are more likely to suffer organic mental illness than their juniors.

Functional mental illness is related to emotional problems. Frustration caused by waning physical ability, loneliness, rejection and fear of death often can create symptoms as severe as those caused by organic illness.

Response to treatment of either type of mental disorder for those 65 and older is virtually the same as for other age groups. Two-thirds may be expected to recover almost completely or to improve significantly.

Depending on the type and severity of the disorder, an activities program can prove of great value, especially in helping to direct individual tensions and energies to worthwhile accomplishments. A sense of belonging and importance can be established through effective group activity, particularly when community volunteers are involved.

Senility

Senility usually is the result of organic brain disease. The two chief chronic brain killers are cerebral arteriosclerosis, wherein hardening of the arteries in the brain prevent sufficient oxygen from reaching it, and senile brain disease, where the brain simply wastes away. In both cases, cause is unknown.

Both diseases foster memory loss and confusion. Experts disagree, however, as to the inevitable progression of the diseases. In some cases, the progress of the diseases has been halted. In addition to memory loss, individuals so afflicted tend to become irritable, lose interest in appearance, tend to live in the past, behave in childlike fashion, and eventually become incontinent.

An activities program can help those afflicted by providing group activity to help maintain the individual's awareness of others and a secure atmosphere involving pleasant activities which are simple, repetitive and possibly associated with familiar activities of the past.

Parkinson's Disease

Parkinson's Disease is not really a disease but rather a group of symptoms.

Parkinson's symptoms include a progressively worsening shaking of the hands, stiffening of the muscles, a masklike appearance of the face, and a shuffling gait when walking. Parkinson's is not contagious nor is it fatal. While it does not paralyze, it can cause muscle tissue to change through disuse.

It is important to note that Parkinson's has no effect on mental ability. A person's intellect remains sharp and clear. As a result, the indi-

2994

vidual with Parkinson's easily can become embarrassed through inability, drooling, etc. While embarrassment does not cause symptoms, it can aggravate them. Therefore, a victim of Parkinson's disease needs sympathetic reassurance and understanding.

There is no cure for Parkinson's Disease. In some selected cases the disease symptoms may be removed through surgery, but in most cases one must rely on physical and occupational therapy to maintain mental and physical ability at the highest possible peak.

Obviously an activities program is desirable in the rehabilitation of the victim of Parkinson's Disease. Physical activity can maintain maximum flexibility and use of all muscles. Group activities can spur social interaction and conversation. Activities which will bring a sense of self-reliance and self-respect to the afflicted individual should be encouraged.

Aphasia

Aphasia is an organic condition of the brain which can result from different forms of other brain diseases or injuries such as hemorrhage, arteriosclerosis, etc.

Aphasia results in speech disorders which can be classed as "motor aphasia" or "sensory aphasia."

Motor aphasia is characterized by the inability of the afflicted individual to express himself in words. He can understand what is said to him, but can only use gestures in reply.

Sensory aphasia is characterized by the inability of the afflicted person to understand what he can see or hear. In some cases, an individual cannot distinguish words from other sounds—all is noise without meaning. In other cases, the individual can distinguish words from other sounds, but they have no meaning—as if someone were addressing him in a completely foreign language.

Treatment for aphasia is primarily speech therapy.

An activities program can provide the afflicted person with challenges easily met and accomplished. Depending on the seriousness and type of aphasia involved, giving or demonstrating instructions is a key element in involving the individual in the activity.

Hearing Loss and Deafness

Hearing loss or deafness can result when the hearing mechanism (fig. 33) is somehow disrupted. The ability to hear is dependent on a series of functions. Basically, a noise gives off sound waves or vibrations. These vibrations beat on the ear drum. The vibrations given off by the ear drum are carried to the middle ear which is composed of three delicate bones. The bones pass the vibrations from one to the other. The third bone, the stapes (pronounced staypeez), connects to the inner ear. When the stapes vibrates, it creates waves in the fluid of the inner ear. These waves are detected by microscopic hairs which create an electrical impulse in the hearing nerve. This impulse is carried to the brain, and the brain gives the impulse meaning. An impairment in any one of these functions can cause a hearing loss, or, in some cases, total deafness. This impairment could be blockage in the auditory canal, a broken ear drum, or brain damage, among many others.

FIGURE 33.—Hearing mechanism.

Hearing loss is especially common in old age. The exact cause for this loss is unknown, although some think it is due to changes in the brain's ability to give full meaning to the electrical impulses received. Usually it involves

2995

less and less ability to hear higher tones. This lessening ability takes place over many years.

An activities program cannot restore hearing. Participation in activities, however, can help an individual to overcome some of the problems which are associated with hearing loss or deafness. An activities program will help the hard-of-hearing or deaf individual to socialize and accomplish worthwhile tasks which impart a sense of self-reliance and self-respect.

When speaking to such individuals, make sure that background noise is as low as possible. Speak with your face and lips facing the individual. Talk slowly and distinctly with a little pause between words and sentences. Speak slightly louder than normal and lower your voice to keep tones as low as possible. Remember—be patient and include the hard-of-hearing or deaf person in as many activities as other afflictions permit.

Blindness

About half the people who are unable to see today are 65 years of age or older. Important causes for blindness in adults are cataracts and glaucoma. A cataract is the clouding of the lens of the eye, and glaucoma is characterized by pressure of liquid in the eyeball which can crush the optic nerve (fig. 34). The specific cause for each is unknown.

Figure 34.—The eye.

In both cases, considering modern and steadily improving surgical and other treatment techniques, there is an increasingly greater chance that vision can be restored.

For those who have been afflicted in later years and who do not have a chance for the restoration of sight, an activities program can become a major element in readjustment and rehabilitation.

Activities will be especially helpful in developing social interaction for the blind individual, and can help in the development of other senses, especially touch and hearing, which in turn can encourage self-confidence through activities that are useful and worthwhile. For help in setting up a special activities program for a blind individual, contact your local agency for the blind.

Emphysema

Emphysema is a disease of the lungs which strains the heart and, in some cases, can cause death.

In healthy breathing, lungs efficiently extract waste gas, carbon dioxide, from the blood as it circulates through blood vessels in the lungs. Then like a bellows, the lungs exchange the carbon dioxide with fresh air from which oxygen is extracted. The oxygen then is distributed throughout many air spaces in the lungs by a tree-like arrangement of tubes called the "bronchial tree." (See fig. 35.)

The tubes end as tiny "bronchioles" that feed elastic, bulb-shaped air sacs called "alevioli." Healthy bronchioles and alevioli have elastic properties that allow them to expand or contract giving the lungs the bellows effect.

Covering all passageways from the nose to the lungs is a thin mucous blanket. Beneath the mucous blanket are microscopic hairs called cilia which are constantly in motion. Together the mucous and cilia protect the tissue of the lungs by propelling foreign matter (dust, pollen, etc.) to the throat where it is removed by "clearing the throat."

Emphysema, for causes unknown, penetrates the mucous layer and destroys the cilia. Walls of the alevioli are destroyed creating large, inefficient air spaces. It is more difficult to remove waste gasses, and more difficult to bring in fresh oxygen. As a result, the heart has to work harder to pump oxygen-poor blood

2996

through the system. Without adequate treatment, death may result from suffocation and an overworked heart. It is believed that cigarette smoking has much to do with emphysema.

FIGURE 35.—Lungs and bronchial tree.

Because it is likely that emphysema will accompany some other affliction, activities should be devised which meet requirements of the prime affliction and also avoid any undue strain on the heart or any type of overexertion. Also to be avoided are dust, smoke, insecticides or any other type chemical irritant.

Diabetes

Diabetes is a condition in which the body does not produce enough insulin to use properly the sugar contained in food which is eaten. As a result, extra sugar collects in the blood.

The cause for diabetes is unknown. There is no cure. Treatment consists primarily of providing insulin to the afflicted individual. This treatment can keep diabetes under control indefinitely, allowing the diabetic person to live an active, normal life.

As Activities Supervisor, you should be aware of some of the problems associated with diabetes which can attack an individual suddenly and without warning. If the sugar in the blood becomes too low, an insulin reaction may occur. Symptoms of insulin reaction are impatience and crankiness, headache, sweating, trembling and hunger.

If the sugar level in the blood becomes too high, there is danger of diabetic coma. Symptoms of approaching coma are increased thirst and dry mouth, dry skin and flushed face, nausea, vomiting and drowsiness. In case any of the symptoms are observed, the nurse should be called immediately. Bear in mind that in some cases a diabetic may have sensory damage and the sense of touch (heat and cold) may be lost or impaired.

Unless otherwise specified by physician, the individual afflicted with diabetes can participate in activities not limited by any other afflictions. It is imperative that those activities involving physical effort be checked first with a physician or nurse, however, as the amount of energy expended affects the body's use of sugar.

Multiple Sclerosis

Multiple sclerosis (MS) is a disease of the central nervous system characterized by patches of degeneration in the brain and spinal cord. Typically, MS strikes men and women in the 20-40 age bracket. Depending on the frequency and severity of attacks, stricken individuals may live for as long as 25 years after the first attack. There is, as yet, no cure. The cause of MS is unknown.

Some of the most noticeable MS symptoms are uncontrolled rolling movements of the eyeballs, uncontrolled sudden emotions, incoordination, stiffness of the lower extremeties, short attention span and incontinency. MS may strike suddenly, disappear then strike again more violently.

Efforts in rehabilitation primarily are directed toward preservation of as much muscle tone and control and mental alertness as possible. Much of this is carried out through planned programs of physical and occupational therapy.

An activities program for the person with MS usually is carried out in consultation with therapists. Chief goals of an activities program are social interaction, as many MS victims tend to suffer from depression, as well as encouraging maximum use of and retention of physical and mental dexterity.

2997

Osteoporosis

Osteoporosis is a disorder affecting middle aged and aged persons which causes a gradual decrease in the amount and strength of bone tissue. Osteoporotic individuals experience a gradual "thinning out" of bones which become less dense, or more porous, tending to lose their normal strength (fig. 36).

It is believed that osteoporosis in old age is caused by the decreased activity of glands producing hormones. Through life, human bones renew themselves. Old bone is continually absorbed by the body and new bone produced to replace it. Slowed hormone production slows the ability to produce new bone, hence there is a process of deterioration without renewal. It also is felt that insufficient intake of calcium in food and drink over long periods of years may cause osteoporosis, since the body is dependent on the intake of calcium for production of new bone.

FIGURE 36.—Normal bone and one with osteoporosis.

Current treatment for osteoporosis includes the prescription of medications containing hormones as well as diets which are rich in calcium.

An activities program for an individual with osteoporosis should avoid requiring an individual to stand for long periods. The risk of accident with any heavy object also should be avoided, as well as the lifting of any relatively heavy object even in routine activities.

Fractured Hip

The term "fractured hip," as used regarding the aged, usually means that the femur, or long bone in the thigh is fractured where it is attached to the pelvis or hip (fig. 37). The two most common places for the fracture to occur are at either the neck or top of the femur or slightly below that point.

Often the fracture occurs as a result of a general weakening of the bones called osteoporosis. The bones of the hip simply cannot bear the weight of the rest of the body.

The cure for a broken hip in the aged involves surgery—either the insertion of a metal pin between the top of the femur and the rest of the bone, or the placing of an artificial top on the femur. (See fig. 38.)

Activities can help an individual overcome problems of daily living, either on a temporary basis until recovery is completed, or on a permanent basis if surgery is not attempted. Activities can restore a sense of self-confidence and self-reliance.

FIGURE 37.—Types of hip fractures.

FIGURE 38.—Repairs of hip fractures.

2998

Appendix B Suggested Reading

The following lists of books and periodicals represent some of the many works that are of value to your program. Those books marked by an asterisk (*) should be purchased for permanent reference.

General Information

AMERICAN STANDARD SPECIFICATIONS FOR MAKING BUILDINGS AND FACILITIES ACCESSIBLE TO, AND USABLE BY, THE PHYSICALLY HANDICAPPED, American Standards Association, Inc., National Society for Crippled Children and Adults, Inc., 2023 West Ogden Ave., Chicago, Illinois, 1961.

*BRAILLE BOOKS FROM LIBRARY OF CONGRESS, Division for the Blind and Physically Handicapped, 1291 Taylor St., N.W., Washington, D. C. 20011.

COMMUNITY RELATIONS HANDBOOK, Hoffman, Charles, American Nursing Home Association, Washington, D. C., 1970.

CONDUCTING WORKSHOPS AND INSTITUTES, Adult Education Association of the USA, P9, 1225 19th St., N.W., Washington, D. C. 20036.

*CURRENT LITERATURE ON AGING, National Council on the Aging, 315 Park Ave. South, New York, New York 10010.

*CYCLOPEDIC MEDICAL DICTIONARY, Taber, Clarence W., ed., Davis Publishing Co., 1965.

EDUCATION FOR AGING, Adult Education Association of the USA, P17, 1225 19th St., N.W., Washington, D. C. 20036.

EFFECTIVE PUBLIC RELATIONS, Adult Education Association of the USA, P13, 1225 19th St., N.W., Washington, D. C. 20036.

*FIRE AND SAFETY CODE FOR YOUR STATE, Appropriate state agency.

*GUIDE TO . . . BOOKS ON RECREATION, A, National Recreation & Park Association, 1700 Pennsylvania Ave., N.W., Washington, D. C. 20036.

HOW TO USE ROLE PLAYING, Adult Education Association of the USA, P6, 1225 19th St., N.W., Washington, D. C. 20036.

HOW TO WORK WITH OLDER PEOPLE, Vickery, Florence E., Division of Recreation, Dept. of Natural Resources, State of California, Publication No. 59-3, 1960.

*LICENSING CODE FOR YOUR STATE, Appropriate state agency.

2999

PRESS RELATIONS HANDBOOK, Hoffman, Charles, American Nursing Home Association, Washington, D. C., 1967.

WHEELCHAIR SELECTION: MORE THAN CHOOSING A CHAIR WITH WHEELS, Fahland, Beverly and Grendahl, Rehabilitation Publication No. 713, American Rehabilitation Foundation, 1800 Chicago Ave., Minneapolis, Minnesota 55404.

General Periodicals

AGING, U. S. Dept. of Health, Education and Welfare, Special Staff on Aging, Supt. of Documents, U. S. Govt. Print. Office, Washington, D. C. $1.00 per year.

GERIATRIC FOCUS, Knoll Pharmaceutical Company, Orange, New Jersey.

MODERN MATURITY, AARP Membership Dept. 406 East Grand Ave., Ojai, California 93023.

NURSING HOMES, Professional Publications, Inc., 4015 West 65th St., Minneapolis, Minnesota 55435.

Activity Programming

ACTIVITIES FOR THE AGED AND INFIRM, A HANDBOOK FOR THE UNTRAINED WORKER, Merrill, Toni, M.A., Charles C. Thomas, Springfield, Illinois, 1967.

GROUP WORK WITH THE AGED, Kubie, Susan, International University Press, New York, New York, 1953.

GUIDE TO PLANNING AND EQUIPPING A HANDICRAFT FACILITY FOR A NURSING HOME, Bengson, Evelyn, O.T.R., Rehabilitation Education Service Unit, State Dept. of Health, Olympia, Washington.

*HOW TO TEACH ADULTS, Adult Education Association of the USA, P5, 1225 19th St., N.W., Washington, D. C. 20036, 1955.

LEADER'S GUIDE TO NATURE-ORIENTED ACTIVITIES, Van der Smissen, Betty and Goering, Oswald H., National Recreation and Park Association.[1]

OCCUPATIONAL THERAPY ASSISTANTS PROGRAM, Wisconsin State Board of Health, P.O. Box 309, Madison, Wisconsin 53701.

PHYSICAL REHABILITATION FOR DAILY LIVING, Buchwald, Edith, McGraw-Hill Publishing Company, New York, New York, 1963.

PLANNING AREAS AND FACILITIES FOR HEALTH, PHYSICAL EDUCATION AND RECREATION, Participants in National Facilities Conference, The Athletic Institute.

PLANNING BETTER PROGRAMS, Adult Education Association of the USA, P2, 1225 19th St., N.W., Washington, D. C. 20036.

TIPS—HANDBOOK, National Association of Manufacturers, 277 Park Ave., New York, New York 10017.

TRAINING GROUP LEADERS, Adult Education Association of the USA, P8, 1225 19th St., N.W., Washington, D. C. 20036.

PUB DATE - 70 365p.Report of a Workshop (Northern Illinois Univ., DeKalb, Jul. 20-31, 1970).

DESCRIPTORS - *OCCUPATIONAL HOME ECONOMICS; *WORKSHOPS; *INSTRUCTIONAL MATERIALS; EDUCATIONAL PROGRAMS; PROGRAM DEVELOPMENT; COOPERATIVE PROGRAMS; WORK STUDY PROGRAMS; ADVISORY COMMITTEES; *RESOURCE UNITS; CHILD CARE OCCUPATIONS; FOOD SERVICE OCCUPATIONS; HOME FURNISHINGS; SERVICE OCCUPATIONS; SECONDARY GRADES

ABSTRACT - A 12-day workshop attended by 37 participants focused on the establishment and development of vocational home economics programs, including cooperative and work-study programs, at the junior and senior high school level. Materials were developed for school administrator use in developing programs and for teacher use in planning and conducting programs. Projects resulting from the workshop and provided in this document are: (1) Initiating a Cooperative Vocational Home Economics Program in a Small School, (2) The Advisory Committee, a description of the formation, selection of membership, and functions of the committee, (3) Being a Better Friend and Employee, a 3-week teaching unit for an introductory course to vocational home economics at the eighth grade level, and (4) several resource units for wage earning programs in child care, clothing, foods, home furnishings, personal services, and home economics related occupations. WORKSHOP

VOCATIONAL PROGRAMS IN HOME ECONOMICS

The workshop focused on the establishment and development of vocational programs in home economics including cooperative and work-study. Legislation affecting occupational education was reviewed. Participants became aware of services and publications of the state department and national agencies, as well as university and other resources.

Speakers furnished basic information on the structure of vocational education today and gave examples of functioning occupational programs in Illinois. Other learning experiences included visitation of the Mid-Valley Area Vocational Center at Kaneville, Illinois and a lecture demonstration by Dr. Robert Hoppocks on occupational guidance and counseling.

I.

PHILOSOPHY

Congress has challenged vocational education to emphasize new job program and concepts such as the "cluster concept," where you teach the child several related skills so that he will not be tied down later to one job.[1]

Congress also challenged home economics to get into the new area of training for the dual role of homemaking and wage earning. Traditionally, home economics has been challenged to train people for homemaking, but now it is being called upon also to train people for jobs.[1]

With these challenges in mind, home economics programs should revise their curriculums to meet the need of the dual role and better prepare the individual for the changes in our society.

Source:

[1]Jennings, John F., "Legislation Affecting Auxiliary Personnel" Journal of Home Economics, Vol. 62, No. 2, February 1970. p. 95.

II.

RATIONALE

Many youths do not obtain education beyond high school; thereby making it necessary that the high school must provide a comprehensive program consisting of a general program, a college-entrance program, and a vocational entrance program. It is in the latter area that many high school curricular programs fall far short and this is especially true in the small school.[1]

One of the continuing functions of leadership in programs of vocational education is the planning function. Without successful planning a program drifts into a state of ad hoc decison making without recognized goals or purposes, and neither the community nor the staff will find such a process satisfactory. It is not possible to maintain staff morale or a sense of direction in an enterprise which appears to be governed by expendiency, or which seems to be out of touch with the realities of the world of work. Lack of planning usually results in a status quo program which becomes more and more inadequate as time goes on, and may eventually have to be completely reorganized.[2]

Sources:

[1]Griessman, Eugene B., Densley, Kenneth G., Vocational Education in Rural Areas, ERIC Clearinghouse, The Center for Vocational and Technical Education, The Ohio State University, 1900 Kenny Road, Columbus, Ohio 43210, p. 50.

[2]Organization and Operation of a Local Program of Vocational Education, U. S. Dept. of Health, Education, and Welfare/Office of Education, Instructional Materials Laboratory, Trade and Industrial Education, The Ohio State University, 1885 Neil Avenue, Columbus, Ohio 43210, p. 21.

High school vocational curricular offerings are limited and have received little attention. In this paper we have tried to tie together the need of the small school with the necessity of good planning to provide a basis which will encourage more small schools to expand their offerings.

III.

OBJECTIVES FOR GROUP PROJECT

A. To prepare the basis for a program that meets the needs of the student at present and prepares him for the future.

B. To establish an outline for the formation of an advisory committee which will be a vital part of the total program.

C. To formulate a plan to involve and interest the community in the establishment of the program.

D. To devise a list of the people needed to be informed about the program and methods of doing so.

E. To make guidelines for student selection that places the student with the needs in the program.

F. To make guidelines for training stations that will give the most educational value to the program.

G. To suggest a schedule of activities for planning and establishing a cooperative vocational educational program.

IV. VALUES AND GOALS - HOW TO APPROACH THEM:

In introducing students to the values and goals of finding a job or occupation that they will enjoy, I would begin by giving them a background in our changing economy. I would emphasize, also, future changes that they can expect.

A. Recent changes in our economy since World War II.
   1. Urbanization
   2. Improved living standards
   3. Changing Patterns of consumption
   4. New products and new processes
   5. Changing patterns of employment - automation
   6. more leisure time

B. How do these changes affect YOU as a student and future homemaker?
   (These are some of the important things to bring out)

We can certainly expect many changes in the future and with the changes will come new problems to be solved. An increasing population and growing urbanization will present us with problems of city planning. Highly technical consumer products that make our lives more pleasant may also make our lives a bit more harried if we cannot repair them ourselves and if there are not enough skilled servicemen to care for them. What will Americans do with their increased wealth and leisure time? Will they use them to enrich their lives? We can certainly expect dislocation of labor in the future, but we can also expect that new job opportunities will develop to satisfy the new needs and wants of a changing society. These new jobs, however, will be for the adept; they will be for those who prepare now.

Here are three important things that YOU as a student can do now to prepare your self to cope with these changes.
   1. Invest in yourself
   2. Invest in your education
   3. Invest in your leisure time

It is ~~good for~~ imperative that Home Economists ~~to~~ bring in the consumer area when discussing future goals. ~~One of the better books to use is~~ Suggested References: CONSUMER ECONOMICS by Wilhelms, Heimerl and Jelley, published by McGraw-Hill Book Company. This book also has some basic budgeting problems and offers a beginning understanding in the area of money management.

C. The key to the future.

VOCATIONAL

SELECTION

You now hold the key to your future in your hand. Let js look at what this means. If you will examine it closely, you will see that there are little bumps and valleys that are used to unlock the lock. In your life, we may interpret these peaks as abilities that you have. No two persons have the same degrees of abilities in the same areas. Also, everyone has certain valleys, or disabilities and things that he cannot do as well as other people.

Now to find the key for you to unlock your future, we find that in life there are many vocational and occupational choices. Each of these occupations is different in some respect from the one next to it, and requires certain abilities. If an individual is to be well adjusted, he must fit the requirements of the job just as the key has the proper tumblers in the lock. When the peaks and valleys meet the same pattern in the lock, we can unlock the future and a success is assured.

To go just a step futher, it is not necessary for the key to have high peaks throughout in order to fit a specific lock or occupation, nor will certain disabilities prevent a person from entering an occupation. Some jobs require a lot of one thing - but require a small amount of what we now consider "abstract" intelligence.

It is up to each individual to evaluate his own peaks and valleys and match these peaks with requirements necessary to preform a specific job.

This drawing and the ideas are found in PSYCHOLOGY FOR BETTER LIVING by Lyle Tussing, published by John Wiley & Sons, Inc., New York.

D. Relationship between goals, values and standards.
The student needs to be aware of these three words and what they mean to him/her in relation to job selection. First of all Values is the key as the other two stem from your values. Values are generalized concepts which are important to the individual such as happiness of health. The term Goal - a more specific - is it signifies something definite toward which one works. A standard in its most general sense defines as something used as a basis of comparison.

E. Some values necessary to win the job and be successful there.
1. Proper grooming for work
2. Proper dress for work
3. Job etiquette in a business manner
4. Promptness in everything
5. Relationship with enployeer and fellow employees
6. Maintaining personal health
7. GOOD ADDITUDE TOWARD WORK CRITICISM
8. What is meant by job ethics
9. Awareness of self evaluation and how to correct self
10. What decision making involves
11. What an interview consists of doing
12. How to apply for a job
13. An awareness of characteristics that are developed through job experience
14. Awareness of personal abilities, interests and motivation
15. Possibilities for advancement
16. A desire to be dedicated to a chosen job or profession
17. Knowing how to deal with self tensions in work

MANAGEMENT FOR MODERN FAMILIES by Gross and Crandall, published by Appleton-Century, New York, has information that is useful in discussing these values.

F. Ways that students can learn more about jobs.
It is important for students to value having a job that they will enjoy and will be happy doing. By looking into some of the following suggestions, students may approach a vocation with more assurance.

1. By doing a job description
2. By describing some good and bad experiences in jobs that she is familiar with either by her own experience or by the experience of someone she knows.
3. By demonstrating a skill that is necessary for a certain job.
4. By writing a description of a good worker for her job description.
5. By doing a work simplification project related to job.
6. By doing role-playing of the work situation.
7. By having someone from this area of work being investigated in to talk with the class.
8. By visiting a job situation and observing what a worker does in a typical day.
9. By seeing slides or a film of jobs.

VI. The Community

A. Surveying the Community Needs fore Vocational Program

1. Survey the community for youth's needs for future employment

2. Survey the community for job or resource places for employment in the community

B. Getting the Community Interested

1. Form a committe of interested and hopefully informed people to get together for the purpose of stimulating community interest.

2. Talk to influential people and community leaders. Show them the survey findings and ask for their ideas for providing the needs. Also enlist their help for getting the community interested and invovled.

3. Discuss survey results and possible plans with the School Board and school administers. The working committee will need their approval and support.

4. Have a special school faculty and staff meeting to inform them of the student's needs and future plans. Many of these people will want to help create interest and support in the community.

5. Conduct a meeting with all the extra curricular activities presidents. Tell them about the possible program and find out them interests.

6. Provide a member of the working committee to talk to each school club about the new program and what it will mean to them. If the high school student, who the program is primarily designed for, wants the vocational program, he can be persuasive in convincing adults. The teenagers will talk about it at home. Then the adults will begin discussing it with each other.

C. How to Convince the Community That They Need a Vocational Program

1. At PTA, adult and youth church functions, and clubs and organizations such as Rotary, Lions, etc, have a committe member tell about the survey results and how the vocational program can meet these needs. Point out how everyone is needed to make the program successful.

2. Advertise with radio announcements and posters in downtown windos about the community needs, vocational programs and its benefits.

3. Publicize and have a general meeting for all these concerned and interested in the vocational program.

4. In presenting the proposal, be well supported with facts. The plan should show the rationale that underlines the program, the structure of the program, phases of development, evaluation of the program, costs and benefits it offers to the high school students, businesses and the community.

VII. PUBLIC RELATIONS

Effective public relations is recognized to be a vital foundation for all Cooperative Vocational Programs if they are to be successful. It is essential for the program relies upon the interest and participation of many groups of people within a community.

Program purposes, benefits, objectives, policies, procedures, and activities should be communicated to a wide variety of audiences through various media. In order to produce desired results, the publicity must take into account the concerns of the audiences to be reached and the media and methods which will best convey the message to them.

It would appear that, in a rural community, the word would "get around" easily, but publicity done haphazardly could very well lead to inadequate or misinformation. Also, an understanding of the total plan will help those we're seeking to involve to recognized their part in the program, and make it less likely that they will expect it all to "roll" the first year in operation but will require their continued support to succeed.

From the onset the school administrator will be eager to help formulate the local vocational plan. He, and the school board to whom he is accountable, should be aware of the proposed program change before any feasibility studies are made, either those assessing the needs of the students who will be involved or the manpower needs of the community. After the ground work has been done and the program begins to take shape, the coordinator should present it to the school administrator and the board with the help of information collected by an advisory council in regard to need, objectives, immediate and long-range plans, and expected outcomes. As the new endeavor progresses, the administrator will be interested in the development and may appreciate an offer to observe it in operation in the classroom or at the training stations. It is essential that he learn what problems the program faces and what assistance is needed in order to make it function.

Reports to the administrator and the school board must be prepared carefully so that valuable conference time is used to the best advantage. A Cooperative Vocational Program is a real challenge to a small community, and it will be a "feather in the administrator's cap" if it is successful. It will not be difficult to gain his support. Keep him informed and value his guidance.

The total school faculty must be "in the know" in regard to the vocational program, not just those who operate closest to the departments involved. In a small school many of the faculty members will be needed to lend their special talents in one way or another. Team teaching may very well may very well strengthen the classroom instruction offered in the program. Special or remedial help needed in specific areas of learning will involve some faculty members. We may even find our training stations within the school, teaching students in the skills and attitudes necessary to become teacher or child care aides or food service personnel.

The school guidance counselor is a key figure in the initiation and continued operation of any vocational program. It is through him that much of our students' needs and interests can be acquired. He must know the objectives, the policies, the sequential set-up, and the course requirements in order to acquaint students and their parents with what they may gain from choosing the route of the cooperative program as they may go through high school. The counselor may also make available up-to-date career information and see that he is available to discuss it with interested students.

The school nurse may be a valuable resource person in the areas of health occupations, child care, and aid to the elderly. In a small school, where field trips to hospitals, clinics, nursing homes, or child care centers may not be advisable or possible, the school nurse may be a real asset for specific instruction and guidance.

All students in the school should have the opportunity to learn about the program and what it has to offer them. Publicity offered to teenagers must appeal to their interests and their goals. It should be presented to them in a manner which will gain their attention and thoughtful consideration. Peer-group opinion is a critical factor in the way the program is perceived by students. Satisfied and successful cooperative education graduates are the one best advertisement the program can have. Suggested approaches to students are given on a chart following this article.

Parents have considerable influence in the students' choices of courses and their educational plans. They are frequently uninformed of the opportunities in cooperative vocational education for their adolescents, or they may be misinformed about its purposes and values. Their most common misconception is that sutdents who enroll in the "coop" program cannot meet college entrance requirements. Parents not only want their children to have a good education, but to be part of the upper strata in the school. In order to have the endorsement of parents, the program must be conceived as being educationally sound and socially acceptable. Parents are reached through parent-teacher meetings, direct mail, spaced publicity in newspapers, business sponsored meetings, and personal contact with the program coordinator.[1] In a small school one of the finest ways to reach parents is by home visitation. Personal contact with those who'll be directly affected by the program is one of the coordinator's best means of publicity. Continued conferences with parents, as their students progress in the program will strengthen their endorsement and support. Further suggested approaches to parents are given on the chart following this article.

Those employers in a commu nity who undertake to train the pupils must be well informed concerning the total program. Ideally they have been included

in the shaping of it. In a small community they may very well be a part of the advisory council and the public relations team itself. It must be remembered that their knowledge of the jobs for which we're training and their advise is vital to the learning process. If they are made to recognize that they are an invaluable part of the program, they'll make every effort to lend it their backing.

In any active community there are organizations concerned with community development and eager to help initiate a program particularly suited to the specific needs of the area. Members of civic and professional organizations, welfare agencies, service clubs, and other community groups welcome students and faculty at their meetings to tell of proposed curriculum changes or progress made in programs underway. The vocational coordinator and student youth groups may also establish sound public relations by contributing their efforts toward community-wide goals and service projects.

On the following page is charted some of the ways that, in a small community, we may "get the word around" to those who will share in the responsibility of initiating a Cooperative Vocational Program. The best publicity any program can have, however, will be the graduates coming from it--satisfied and successful young men and women who have found a meaningful place in the world of work.

GENERAL GUIDELINES WHEN PLANNING PUBLICITY[1]

I. Source approval of superintendent or publicity director for the entire publicity program or each item as it is to be released.

II. Publicize what has been done more than what is planned to be done.

III. Give due credit to all people involved.

One of the most essential elements in a publicity program is timing. A chart similar to the one shown on the following page, listing the types of publicity planned and the time when they would be most effective might be helpful in organizing the publicity program.

When writing news articles remember that the opening paragraph is most important. Many readers do not read further than this, so WHO? WHY? WHEN? and WHERE? should be answered in the first sentences. Photographs attract reader interest so should be used whenever possible.

Feature or "spot" stories throughout the year might be written about the students' views and reactions to their jobs; the awarding of annual training certificates, interviews with employers, student youth activities at their organization meetings, including photographs when possible. The public is interested in its schools and enjoys reading about the achivements of young people in the community.

Letters to prospective students and selected businessmen have a persnal touch which is not characteristic of other forms of publicity. Letters to businessmen may be more valuable if signed by the superintendent.

On the following pages are sample news releases and a letter to businessmen which may be adapted to be used in a specific situation.

SAMPLE NEWSPAPER ARTICLES

NEW VOCATIONAL PROGRAM IN HIGH SCHOOL

Classes in Home Economics Cooperative Education are the most recent addition to Blank High School curriculum according to a recent announcement by Superintendent R. N. Pearson.

These classes afford students of Junior and Senior standing both on-the-job and classroom education in a variety of occupations. Practical work experience is provided the student through part-time employment at some cooperating business within the city.

The course is set up for one or two years and carries two credits each year. Students receive pay comparable to that paid beginning workers in the same occupations.

Typical occupations in the program are brical consultant, child care aide, companion to elderly, clothing assistant, dietitian aide, fabric coordinator, floral designer, food caterer, food service employee, home furnishings aide, housekeeping-management assistant, millinery aide, and tester of foods, equipment or textiles.

The program will operate under the direction of Mrs. Jane Williams, teacher-coordinator. Mrs. Williams will be responsible for the selection and placement of students and will correlate their classroom and practical education. An advisory committee of local business people will be set up by the school to assist Mrs. Williams in organizing and operating the new program.

The addition of this type of program will do much to provide the youth of Anytown with a well-rounded educational program that will fulfill the need for practical and useful training. It is hoped it will enable a large portion of our students who desire to become occupationally competent to enter full-time employment upon graduating from high school.

Figure 37

ADVISORY PANEL

Mr. R. N. Pearson, Superintendent of Blank Public Schools, has released the names of five citizens who have been selected to serve in an advisory capacity to the Home Economics Cooperative Program for the 1969-70 school year. They are Mrs. Dorothy Joiner, Utility Company, Mrs. M. C. Duncan, Northeast General Hospital; Mrs. C. G. Whatley, Brook's Day Nursery; Mrs. Ann Smith, Rawl's Ready-to-Wear; Mrs. A. B. Cantrell, Circle Inn Motel; Mr. Jack R. Banks, Chamber of Commerce; and Mr. R. N. Pearson, Superintendent of Schools.

Students in Home Economics Cooperative Education receive on-the-job training in home economics related occupations. The advisory committee makes recommendations for improvement of the program, aids in publicizing and promoting the program, helps select training stations, assists in evaluation of the program, and provides general advice as needed.

The program is under the direction of Mrs. Ruth Duncan, teacher-coordinator.

Figure 38

SAMPLE LETTER TO BUSINESSMEN[1]

Date

Business Address

Dear Mr.

We are taking this means of acquainting various employers who are engaged in home economics related occupations within our community of a new course--Home Economics Cooperative Education -- which has been added to our high school curriculum. It is intended to enable our school to render a more complete service to our local businesses and institutions by supplying them with better trained personnel from among our graduates.

The Board of Education feels that the inclusion of this type of program will do much to provide the youth of (Name of Town) with a well-rounded educational program that will fulfill the need for practical, down-to earth training. It will enable that large percentage of our students who desire to become occupationally competent to enter full-time employment upon graduation, or supplement their incomes while attending college or a vocational school.

As the name of this course suggests, it is carried on through a cooperative arrangement between businesses and institutions of our community and the local school. Practical work experiences are gained by the student through part-time employment in some place of business -- such as yours -- during each morning or afternoon. Information related to the students' occupation is provided by our high school in a special class scheduled each morning or afternoon. Students must be of Junior or Senior standing and must be at least sixteen years of age to participate in this program.

(Name of teacher-coordinator), teacher coordinator of this program, will make every effort to visit you in the near future and explain the operation of this program more in detail. If you decide that your place of business will be in a position to cooperate in training one or more students, we shall be very happy to include you on our "faculty".

Very truly yours,

(Name of Superintendent)
(Name of School)

1. Adapted from Industrial Cooperative Training Handbook. College Station, Texas, Texas A & M University. May 1968. p. 102

VIII. Student Selection

It is most important to select good quality students for the program. This does not necessarily mean they must be "A" or "B" students, but they should have the aptitudes and qualifications necessary for success in a given occupational area. The student should have established a broad career goal.

A. Eligibility

Junior and seniors who are 16 years of age or older are usually selected. Most schools prefer students to have had some pre-vocational course. Students should make their desire to receive training known in the school guidance office and be approved by Vocational Home Economics Department.

B. Factors to Consider When Selecting Students

The following factors can be used as guidelines for selecting students for a Home Economics Cooperative Education program as suggested in the Texas Technical University, Home Economics Cooperative Handbook.

1. Interest in receiving training
2. Physical suitability (good health and stamina)
3. Disciplinary record
4. School attendance records
5. Hobbies
6. Past work experience
7. Personality characteristics
   - a) punctuality
   - b) honesty
   - c) loyalty
   - d) alertness
   - e) accuracy
   - f) perserverance
   - g) cooperation
   - h) initiative
   - i) sincerity
   - j) willingness to work
8. Recommendations
9. Past employers' opinions
10. Other school activities
11. Personal appearance
12. Grades in high school

C. Contacting Students

Spring recruitment is the best. It may be possible to contact students by examining student record cards and mail a letter and interview schedule to all eligible students. (See Figure 3)

Students who show an interest can then be interviewed personally.

An assembly program might be held or the coordinator might talk to a particular class and have the students fill in an application form.

Application forms asking for the following information can be given to the students prior to the interview.

1. Occupation desired
2. Reason for choice
3. Possible training stations
4. Resume' of school credits
5. Four references
6. Signature of parent
7. Signature of student
8. Agreement to join Future Homemakers of America

An example of an Application For and Acceptance and Placement Policies will be found in Figures 4 and 5. If any of the occupations are not available in a particular city, they should be deleted.

D. Securing Recommendations

Student rating sheets should then be sent to the teachers the students listed as references. (See Figure 6) Further information about attitudes, character, and ability to get along with others in a working situation can be obtained from interviews with former teachers, principals, and/or employers.

LETTER TO STUDENTS

Date_____

Dear_____

A new program of Home Economics Cooperative Education has recently been added to the list of high school subjects. In this program the student will be employed a minimum of fifteen hours a week in a place of business in the city. The student will spend half of each day in the study of regular high school subjects including a special class related to occupational education. In addition to receiving practical work experiences, the student will be paid for work performed while acquiring training in an occupation of his choice.

This is primarily a two-year course for which a student may achieve two credits per year. This plan enables the student to prepare himself for full time employment and at the same time satisfy graduation requirements. Training in approximately thirteen occupations will be available this year. In general, choices may be made from the following types of occupations: bridal consultant, child care aide, companion to elderly, clothing assistant, dietitian aide, fabric coordinator, floral designer, food caterer, food service employee, home furnishings aide, housekeeping management assistant, millinery aide, and tester of foods, equipment, or textiles. The occupation selected by a student will depend upon his interests and abilities.

If you are interested in obtaining further information regarding the program, you may contact (Teacher-Coordinator) at the (Name of High School) any morning during the week of (Date) from (Time). If it is not possible for you to come in person, you may mail the attached blank to (Teacher-Coordinator) at the (Name of High School).

Sincerely yours,

(Name of Principal)

ACCEPTANCE AND PLACEMENT POLICIES

The very nature of the Cooperative Home Economics Education program makes it necessary for students to possess certain qualifications. The following statement of the principles concerning the necessary qualification is made in an effort to inform students so they will receive the intended vocational benefit from the course.

ATTENDANCE -- All students are employed in some occupation. The businesses that employ students must make adjustments in schedules to provide training stations. This makes it necessary that the student have a good attendance record and continue in regular attendance.

GRADES -- Students may not have a period for study hall in their schedules. Therefore, they will have to budget their time so they can study. Students who make good grades will be more able to make this necessary adjustment.

CITIZENSHIP -- When students are employed they represent the business, the school, their family, and themselves. Employers want good citizens. Only students with excellent citizenship records should represent the school to the businesses.

EMPLOYABLE -- All students must be recommended to the employer by the coordinator. A professional recommendation of this type can only be made when the coordinator believes that the student has the necessary qualifications for a specific job in a specific business. Since the coordinator's responsibility is to place the right student in the right training station, it is necessary for her to use every means at her disposal so that the student may receive the maximum benefit from the course.

Do you understand that acceptance into the course depends upon placement in an approved training station?_____Have you read the "ACCEPTANCE AND PLACEMENT POLICIES" above?_____

IX. Selection of Training Employers

Training stations that will give the most educational value to the cooperative vocational education student-learner must be selected.

The training employer and his employees should have a favorable attitude toward the cooperative education program.

There needs to be a survey to determine if there are a sufficient number of employers who are capable and willing to deliver quality on-th-job training.

A. Criteria in Selecting Training Stations

1. Potential to provide training for occupation that are challenging and worthy of the students learning time and efforts.

2. Competence of employer in their occupation.

3. Respectability of community and reputation of employer is excellent.

4. Good standards of workmanship.

5. Work environment is conductive to good health, to safety, and to development of job satisfaction.

6. Adequacy and appreciation of equipment.

7. Volume of business

8. Policies of the company toward occupational training.

9. Existing employer-employee relationships.

The employer should be able to provide a job throughout the school year. Students should be able to rotate from one task to another as they become skilled. The wages received should be comparable to those received by other beginners in that occupation.

The training stations should be easily accessible. It should have suitable hours of work, an opportunity for learning and advancement, and an availability of instructional materials for the occupational area.

State regulations regarding the employment of minors should be carefully considered.

X.

A SUGGESTED SCHEDULE OF ACTIVITIES FOR

PLANNING AND ESTABLISHING

A COOPERATIVE VOCATIONAL EDUCATIONAL PROGRAM

Activities	Suggested Time for Accomplishment
A. Survey of businesses in the community	February or March
B. Complete application and student agreement form.	March or April
C. Interview students who completed application forms to identify more specifically the kinds of businesses in which students are interested.	March or April
D. Review information obtained in step A, to identify businesses which could provide training situations to meet student needs and interests.	April or May
E. Contact businesses identified as possible training situations to determine willingness of businessmen to accept student-learners.	May or June
F. Use information obtained to outline tentative training plan which the student would follow.	Summer
G. Contact local businessmen to review tentative training plan to make necessary adjustments to fit program to the needs and abilities of the student.	Summer
H. Arrange for students to be interviewed by prospective employers for employment as student-learners.	September
I. After employer agrees to employ a student, the coordinator, the employer, the student, and the parent (s) meet to review, and revise the training agreement.	September

THE ADVISORY COMMITTEE

By Betty Schindel
Presented to Dr. Smith
July 30, 1970
Home Economics 450

3051

The advisory committee is not new to vocational home economics. However, its use has been limited due to the fact that some administrators and boards of education are of the misconception that advisory committees make the decisions for the school. If this misconception is cleared, perhaps advisory committees will be one of the best known phrases of the seventies. The changes brought about in community concern by various events in the sixties, will probably bring more community concern in the seventies. Since the advisory committee is developed from the community, it fits in with our time. With teacher's salaries increasing and with discriminations mounting, the community cannot simply stand by and watch the schools making decisions. They, instead, must take an active part in the happening. A way in which the community can take part is through the advisory committee. In this paper, the advisory committee has been divided into three main topics. They are as follows:

1. Forming a committee
2. Membership
3. The function of an advisory committee

The separate words advisory and committee are heard quite frequently, however, for the purpose of this paper, a definition is in order. The word "advisory" is defined as "exercising the power to advise."[1] What is "to advise?" "Advise" is "to council, caution or warn, recommend, inform or consult."[2] A committee is defined as "a body of persons delegated to consider, investigate, take action on, or report on some matter."[3] An advisory committee is a body of people delegated to exercise the power of counseling, cautioning or warning, recommending, informing and consulting on certain matters having to do with education.

The need of the advisory committee to our educational system is becoming more evident as time passes. There is friction mounting between educational administrators and the community which they represent because of misunderstandings. The community is concerned as to where tax money is being used. The community is also curious as to why so many students are not being educated to fill the many needs of society. On the other hand, the educators want to know what the parents of the community expect from the school system. Suggestions are needed on how to keep students in the school and off the streets. The educators need suggestions on community needs and useful course material. They also need evaluation reports on the efficiency of the program. The community and the school system must communicate. "We must listen to the people we are trying to serve and enlist their support not just as spectators, but as active participants in the decision making process."[4] How can this be done? The answer to this question is found through giving the community, both parties must work together. When each one becomes aware of the needs of the other, it becomes much easier to solve the problem. If the groups of the community would join together for a common cause, they could become more effective in limiting their problems instead of each on striking out on its own.

There are many types of advisory committees. They range from national to state to local. Under the local advisory committee, there are such committees as the steering committee, the general advisory committee, the departmental and the specific occupation advisory committee. The National Advisory groups "have been responsible for presenting to the Congress recommendations which have shaped two of the most important pieces of Vocational Education Legislation passed

in recent years."[5] These two pieces of legislation were the Vocational Act of 1963 and the Vocational Educational Amendments of 1968. The Vocational Education Act of 1963 called for a periodically assembling of an advisory council to review the nations' programs, to report the findings, and to make recommendations. The first council of this nature assembled on November 22, 1966 and presented their recommendations on December 11, 1967. These recommendations were formulated in the Vocational Educational Amendments of 1968. As a result of these amendments, a National Advisory Council, as well as state councils, was formed. The newly formed National Advisory Council was to advise, evaluate, and make recommendations to the Secretary of Health, Education, and Welfare, these recommendations would then be submitted to Congress. This National Council was to consist of twenty-one members, of which no less than 1/3 was to be the general public representatives. The remaining members of the council was to be persons familiar with "Vocational Education needs and other problems of management and labor; manpower problems and administration of manpower programs; administration of state and local vocational education programs; problems of handicapped; problems of the disadvantaged; and post-secondary and adult programs."[6] These members and the general public representatives are to meet at least four times a year.

As stated before, the Vocational Amendments of 1968 permitted the forming of State Advisory Committees. However, in order for the state to receive any money from the Federal Government, a committee must be formed to perform the following three functions:

1. "Advise the state board on the development of policy matters arising in the administration of state plans.

2. Evaluate programs, services and activities.

3. Submit to the commissioner of Education and the National Advisory Council an annual report on the effectiveness of Vocational Education, with recommendations for such changes which may be warranted."[7]

With these funds received from the Federal Government, needed studies may be carried out by the council. Also, staff members may be hired, and other authorized activities may be taken care of. The public is not eliminated from the duties of the council. The council must meet at least once a year. At this meeting, the public is allowed to express its' views.

The first which expresses the community need for the advisory committee is called the Steering Committee. The job of this committee is clearly one of guiding and assisting in the process of translating community need. This duty is accomplished by the following five responsibilities:

1. "Ascertain the interest of the community in vocational education.

2. Assess the specific needs of the area.

3. Set up standards for equipment and instruction.

4. Review instruction content.

5. Assist in the determination of selection criteria for pupils and teachers."[8]

When the steering group has established a program need, "it should be dissolved after a decision is made as to whether to start a cooperative education program."[9] The members of this committee are usually people of the community who represent labor and management. The members are also from social groups and other active individuals in the community. There is no set number for the membership, but twenty-five members have been found to work extremely well in larger communities. In smaller communities the number should be lessened.

Once the Steering Committee has been dissolved, an Advisory Committee should be appointed. The duty of the committee is still only to advise. It may advise on training stations, sources, types of instructional material, assist its youth club activities, provide related speakers to classrooms and studies, assist with banquets, investigate the need for adult education and help set standards for students. Some of the members of the Steering Committee may be asked to form the advisory committee. The co-ordinator and other educators, along with training station employers are the most likely to remain on the committee. The membership of the committee is reduced from twenty-five to a range of seven to twelve people. Staggered terms of membership help to keep some experienced members at all times.

A committee developed to fill the need of the entire vocational program is called the General Advisory Committee. Its members are selected from all the occupations represented in the program of the school. The duties of this committee are to decide the needs of individuals and community; help find the requirements of the area labor markets; make sure the programs offered are realistic and practical for the students; help build up the respect and prestige of vocational education programs; and work on the planning of long range goals.

The final advisory committee that will be mentioned in this paper is the Advisory Committee for specific occupations. It is concerned with the content and experiences involved in a specific occupation. "These may be food merchandising, child care, ornamental horticulture, or carpentry."[10] The members of these committees are often times responsible for donations of materials and supplies at a reduced cost or free.

The purposes of advisory committees are the same. That is to say that all advisory committees try to provide and identify usable advice to the educative administration. They are to work together in producing the best education, equipment and instructional material for their community needs. Another of their duties is that of "increasing the involvement of the community and parents."[11] It has been said many times that "it is regretable that the advisory committees are often seen only as a public relations device. They may serve this purpose - providing information to the public, acting as a reflection of probable public reaction to school policies or decisions, or being a group to share the blame for unpopular action. But the basic purpose of the advisory committees should be to provide usable advices, to have new ideas and to bring fresh judgment. They are expected to be creative."[12] To me, much of this quote is a view from the fifties or later era. We now look upon advisory committees as partners in the education of our children and not just public relations men.

After research, it appears that the main purposes of an advisory committee are as follows:

1. To assist the schools in identifying needs.
2. To evaluate the effectiveness of school programs.
3. To communicate information to the public.
4. To act as sounding boards.
5. To act as vehicles through which members of community can voice their opinions.
6. To insure concentrated effort of all available resources.
7. "The net work of advisory committees serve as valuable resources for improvement."[13]

The members of the advisory committees are appointed and approved by the Board of Education. Sometimes the board appoints a representative to act in its name. This may be the vocational director, superintendent, or even the principal. Whoever is chosen acts in the name of the highest school authority. This is a good point to have understood by the appointed committee members. Their job is to advise, and the board is to have the final word in all matters. When the representative of the board is looking for suitable members, he should keep in mind that this committee is to represent the community, and the total committee is made up of laymen. The co-ordinator is only a liaison between committee and school. Another important qualification of the members is experience and enthusiasm. Each member must show substantial interest in the program and must have had recent firsthand, practical experience in the area of concern. The age of the members should not be limited. It could be a rash mistake if the young or the old were eliminated from the committee. Character is another quality which should be examined in selecting the committee members. "Candidates for membership should be people of intelligence, integrity, and courage. They should be responsible, civic minded, and co-operative."[14] Many times, it is thought that the aggressive and ambitious people make the best committee members. This is only true if their ambition and aggressiveness is used toward their common goal. This will be a foreful committee member. Another factor which is very important in selecting a committee member is the time which this person will have to contribute toward the committee. Each member must be available for frequent meetings and should be prepared in advance for these meetings. If it is difficult to find people with available time, it is acceptable to have alternates. This applies especially if the person is representing some group. Balanced representation of all groups effected by the committee

or affecting the committee is of most importance. They must all have a voice in the program. When the committee becomes one sided, it becomes dangerous. This quality of being one sided could stimulate groups to a point where they refuse to help or cooperate. This destroys most of the work that an advisory committee is striving toward.

The committee size is an important factor is dictating the success of the advisory committee. There is no set number for membership in a committee of this nature. Each school must determine the number of members which it feels is necessary. There are several factors to be considered in the size of the advisory committee. They are as follows:

1. "The proposed function of the committee.
2. The size of the program and community.
3. The realization that working groups find decision making difficult.
4. The fact that informal constructive discussion is hindered if the group is too large."[15]

It is just as harmful to have too many members as it is to have to few. "Studies have indicated that as size increases, there will be decreasing group cohesiveness and increasing organization and division of labor in the group, along with development of cliques and possibly of factions."[16] Even though the size of the committee is left up to the board, there are a few committee sizes which have proven very effective. The first of them is that of the Steering Committee which has a membership of around twenty-five. The General Advisory Committee, representing an entire vocational education program, is most effective at around twelve to fifteen members. Six to ten members is thought to be adequate for the Specific Occupational Committee. The Departmental Advisory Committee, which is formed after the Steering Committee has been dissolved, seems to function best with seven to twelve members. However, these are only

guidelines, and each school should decide on the membership size which would function properly. In a smaller community the advisory committee would consist of fewer members than that of a larger community. Also, in the small community there probably would not be a need for the Specific Occupational Committee, and in some instances there may not be a need for the Departmental Advisory Committee. However, I feel the Departmental Advisory Committee should always be encouraged.

It is very difficult to set hard and fast rules on policies and procedures for the operation of advisory committees throughout the United States. Only generalizations can be made, and one must choose those rules which apply to his situation. It appears that the successful committee works best if selection of a formal or informal procedure is suggested by the community and the school situation. The formal policy has advantages because its rules and procedures can clarify purpose and create an atmosphere of stability. Many times some people are more willing to work in such a group than in an informal atmosphere. The danger that it possesses is that often times too rigid of rules are set up and this could slow down the initiative of the committee members as well as make it difficult for the committee to function. Policies should be only the provisions necessary for efficient operation. The informal view has been successful in many situations. This is because it possesses the flexibility needed to fit different circumstances. Regardless of how informal the policy being used is, a set of guidelines and responsibilities should be drafted to give the committee direction and to clarify the correct position of the committee within the school system.

What exactly are the duties of an advisory committee? This is not a simple question to answer. Every day educators and committee members are finding new and helpful uses for the advisory committee. The following list will give the most common uses of this committee, but these are far from being the only uses.

on next sheet - it should follow immediately

1. Accept committee assignment
   a. Organizational meeting
   b. Hear explanation of home economics program

2. Determine community needs
   a. For high school and post-high school cooperative programs
   b. For adult classes

3. Evaluate program
   a. Advise whether or not program is providing the kind of training life situations demand
   b. Review curriculum and objectives of program
   c. Review adult classes
   d. Secure opinions from business people
   e. Review all features of the program including the various forms used

4. Assist in the preparation and selection of course material
   a. Establish need for a course
   b. Review present course outlines and texts used
   c. Suggest revisions or additions
   d. Review objectives

5. Help select and place students
   a. Review applications
   b. Suggest training stations
   c. Suggest placements
   d. Suggest placements for graduates

6. Help select instructors and serve as instructors
   a. Teacher-coordinators
   b. Adult instructors
   c. Serve as instructor when coordinator is out of town

7. Guide and support coordinator
   a. Give encouragement and stimulation
   b. Without committee, coordinator may feel he is almost an isolated worker
   c. Coordinator can adjust activities by hearing commendations and criticisms

8. Assist in surveys
   a. Determine data to be gathered
   b. Suggest means for securing data
   c. Help secure certain information
   d. Assist in data interpretation

9. Help to provide continuity
   a. Program of work maintained even though there is a change in coordinators

10. Provide financial and legislative support
    a. Arrange for donations
    b. Set up scholarships, awards for honor students

c. Support school administrators for local appropriations
d. Support state and national legislation affecting vocational education

11. Provide public relations service
    a. Interpret program in community
    b. Provide information for counselors
    c. Arrange for exhibits at meetings and in store windows
    d. Develop plans for recognizing students, such as in store advertisements
    e. Arrange to have coordinator present talks before community groups
    f. Help prepare or review brochures explaining the home economics program
    g. Advise on other forms of program promotion

12. Recommend policies for cooperative program
    a. Minimum wages to be paid
    b. Regulations for employment of students
    c. Type of students to be selected
    d. Releasing students after employment
    e. Student ratings

13. Help secure equipment, supplies and instructional material
    a. Arrange for purchase or by gift
    b. Locate instructional materials from local stores

14. Assist in club work (HERO)
    a. Suggest means of raising club funds
    b. Help secure speakers
    c. Provide financial aid for individual members to attend state or national conferences
    d. Serve as judges for local awards and contests
    e. Attend installation ceremony of local officers

15. Assist in securing meeting places
    a. For adult classes
    b. For advisory committee meetings
    c. For field trips, special demonstrations

16. Help plan special events
    a. Banquet and other social activities
    b. Special events participation 17

It is quite evident that the members of the advisory committee do not just walk in and begin working on evaluation programs, surveys, or any other functions of the committee. It would stand to reason that many of the new members will not have a complete understanding of the program. The responsibility to make sure that new members and old members are kept abreast of things is the coordinators. The following list is an outline for coordinators to follow:

1. Develop an understanding of the program
   a. Committee members can then interpret the school's program to the community
   b. Operating policies (including State Plan) can be presented as part of the orientation.

2. Develop responsibility for the program
   a. Keep committee informed on progress in meeting objective of the program
   b. Solicit sincere cooperation and interest by accepting members af full-fledged partners in the program.

3. Keep the committee busy
   a. Improvements and expansion possible when committee's suggestions are considered and accepted.

4. Do not waste member's time
   a. Members should not be asked to do routine jobs
   b. Nor should they be asked to solve problems which they do not have the background to consider intelligently
   c. Plan worthwhile agenda - and send out in advance
   d. Coordinator has all the facts needed for discussions
   e. Distribute minutes to members

5. Give recognition for assistance
   a. Present certificate to members stating their membership on the advisory committee
   b. Provide follow-up reports on committee recommendations on action taken or not taken by the school.
   c. Recognize individual members in printed material
   d. Send letter of commendations at the close of the school year

6. Accept committee recommendations
   a. A source of constructive criticism
   b. Should not organize committee if the school does not act upon its advice. 18.

The first meeting of the newly formed committee is one of the most crucial parts of the entire program. If the coordinator does not produce an enthusiastic view in the members of the committee, he is in for a long and difficult time. To begin the first meeting, the coordinator should have a member of the board, or the superintendent give a message of welcome to the members of the committee. He should make them feel that he is not trying to take over the committee. It is feasible for the coordinator to write this message for the board member. The coordinator will find it helpful to contact a few members before the first meeting whom he feels are interested in the program. At this time, those contacted members and the coordinator go over the agenda for the meeting. Because of this effort, the laymen appear to be in charge of this meeting. When the coordinator prepares the agenda, he places at the beginning the phrase "For Discussion Purposes Only." The reason for this is to give the committee full authority from the beginning. The chairman and other officers are chosen at the first meeting by the members. This is a very critical step for the reason that much of the committee's success will depend on their chairman. After the chairman has been elected, he presides over the committee. Before the meetings thereafter, it is the duty of the coordinator and the chairman to go over the agenda. They must make sure that each member of the committee receives a copy of the agenda well in advance of the meeting. The purpose of this is to familiarize each member with what will be taking place at their next meeting. It will also inform the members of the meeting date.

An advisory committee does not guarantee a successful program. It will not guarantee the committee to be without problems or conflicts. However, a school that is aware of what such groups contribute, can draw from the experience that it takes to build and keep a sound program.

3065

When this advisory role is not filled, the benefits that the educators and community members can contribute is lost. Many times, these benefits press programs to more effective operation. Without the advisory committee, the maximum potential of the program is not reached. ~~It is the students who are hurt without these advisory committees functioning for them.~~

RATIONALE

With technological change, increase in population, more education needed for certain jobs, and advanced skills needed for other jobs, it is important to help a student think of choices vocationally at an earlier age so he or she is better prepared for our rapidly changing society and the realities of work.

An introduction to vocational home economics at the Junior High School level is important for students to start thinking about the things they are interested in for a possible life work. This study, in turn, shows them the relevance between related skills, qualities, abilities, traits, and characteristics as applied to both friendship and employability.

STUDENT OBJECTIVES

Know names of jobs that use home economics skills

Learn the requirements for these jobs

Learn things I like and don't like about these jobs

Learn how to write letters of application for jobs by study an d and practice.

Role playing to learn interviews

Know characteristics for valued friends and employees

Learn the amount of education I need for different jobs.

Know requirements and restrictions in employment

TEACHER OBJECTIVES

Interest students in developing skills for the work world

Guide students in developing personal characteristics necessary in the world of work.

Alert students to job opportunities that exist at the service and technical level in home economics

Identification of pupil interest, aptitude and potential.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

OVERVIEW-LIST OF EVALUATION DEVICES

I. 1. Personal traits check list
   2. List of habits related to employability
   3. List of hobbies related to employability
   4. Essay on occupations that interest you
   5. List of values

II. 1. Essay on life in 10 years
   2. Job application form
   3. Resume
   4. Opinion poll

III. 1. Bulletin board evaluation
   2. Panel discussion evaluation
   3. Evaluate class discussion
   4. Particiaption in speaker
   5. Comprehension of material
   6. Mastery test

CONTENT	LEARNING EXPERIENCES
WEEK I	
Day 1	
Understand relationship of traits and characteristics as a basis for employability are the same as for friendships.	Review characteristics studied in 7th grade.
Analyze the relationship between personal habits and employability.	Do check list of personal traits.
People differ from one another in many ways.	Go over which traits please and which displease others.
Personal habits are related to making friends and being employable such as neatness, cleanliness, freedom from mannerisms, careful use of time and management of money and energy.	List habits that are related to friendships and employability.
Day 2	
Find out and become aware of sources of vocational and occupational information.	Field trip to Library.
Learn to use these available sources.	Investigate information available on vocations.
	Investigate one job area that you are interested in.
Day 3	
Work on developing qualities for friendships and employability.	Read and study outline of background material.
Learn about self.	List hobbies, activities and habits.
Know some characteristics of emotional maturity.	Work out a bulletin board on teen interests.
Know the meaning of terms used in the handout.	Divide interested parties into a panel on working mothers vs non-working mothers.
The range of job opportunities available to a person is limited by the kind and level of his education.	

CHECK LIST OF PERSONAL TRAITS

Check yourself in the appropriate column according to how frequently you show the trait.

	always	often	seldom	Give an example of how you have shown each trait.
Promptness				
Acceptance of criticism				
Sense of responsibility				
Dependability				
Friendliness				
Enthusiasm for learning				
Respect for others				
Sense of humor				
Honesty				
Fairness				
Initiative				
Others (specify)				

RATING MYSELF ON EMPLOYABILITY

Directions: Write "yes" in the blanks on the left of the ones you do.
Write "no" in the blanks to the left of the ones you do not do.
Make a check (✓) beside those which you could improve.

_____ 1. Do I usually enjoy metting People?

_____ 2. Do I usually like to make new friends?

_____ 3. Do I usually remember peoples" names?

_____ 4. Do I usually smile easily?

_____ 5. Do I usually enjoy talking with people over the phone?
6.

_____ 6. Do I usually speak pleasantly to people?

_____ 7. Do I usually find it hard to think of things to say when talking to a person whom I do not know well?

_____ 8. Do I usually try to find out other people's interests?

_____ 9. Do I usually want to talk about my own interests?

_____ 10. Do I usually like to share my interests?

HAND-OUT

I. VOCATIONS

1. Guidelines for making a vocational decision

A. Interests and abilities
   1. Physical requirements
   2. Mental health status
   3. Emotional maturity
   4. Degree and kind of mental abilities
   5. Degree of interests and abilities
   6. Degree of socialization required

B. Educational and training requirements
   1. General education
   2. Employment education:
      High school, vocational school, technical college, graduate study, special courses, adult education, apprenticeship, internship, on-the-job training.

C. Restrictions in occupations
   1. Requirements for licenses, certificates, union or professional affiliations
   2. Special restrictions:
      Age, marital status, dependents, experience, physical limitations, appearance

D. Working conditions
   1. Monetary factors:
      pay scales, tips, commissions, discounts, profit sharing
   2. Time factors:
      Working hours, overtime, vacation
   3. Physical activity
   4. Tools and machines
   5. Safety factors
   6. Opportunities for friendship
   7. Benefits:
      retirement, pension, sick leave, maternity leave
   8. Services:
      health, counseling, meals, parking

E. Entrance into an occupation
   1. Methods used in location employment
   2. Entrance into occupations on trial basis

HAND OUT

Contributions of Home Economics in Preparing Women for Varied Roles

1. Educates for establisning a satisfying personal and family life.
2. Provides knowlidge and skill for wage earning.
3. Offers training at all levels of aspiration.
4. Helps in managing work at home and on the job.
5. Provides for creative and leisure time activities.

Occupations Requiring Home Economics' Knowledges and skills

1. Occupations requiring high school training
2. Occupations requiring post high school or professional training
3. Location of jobs requiring home economics' knowledges and skills
4. Job clusters within areas of home economics:
   a. Care and guidance of children
   b. Home and industrial management and supporting services
   c. Food and industrial management and supporting services
   d. Combination of home furnishings, equipment and services
   e. Clothing management, production, and services
   f. Combination of areas and other related occupations

HAND-OUT

1. Working Women

   A. Characteristics of women in labor force
      1. Number
      2. Age
      3. Family status
      4. Work patterns
      5. Earnings
      6. Types of occupations held
      7. Race
   B. Family adjustments necessitated by employment of homemaker
      1. Scheduling of meals
      2. Scheduling of entertaining and relaxation
      3. Changing patterns of responsibilities
   C. Motivations for women working
      1. Need to provide financial support
      2. Wish to improve family standard of living
      3. Interest in work and posession of skills
      4. Attitudes and expectations of husband
      5. Desire for personal satisfaction
      6. Desire to make contribution to society
      7. Escape from home responsibilities
      8. Desire for independence
   D. Factors which influence a girl's vocational plans
      1. Marriage
      2. Expectations of husband
   E. Changes affecting employment of women
      1. Shift of family to producing unit
      2. Earlier marriage and parenthood
      3. Agencies to care for children
      4. Development of labor-saving equipment and products
      5. Increase in opportunity for education
      6. Increase in job opportunity
   F. Changes in status of women
      1. More job openings
      2. Comparable salary with men
      3. Less restrictive dress codes
      4. Opportunity for advancement
   G. Roles of women
      1. Assume multiple roles
      2. Increased emphasis on role as a wage earner
      3. Less differentiation between roles of men and women

WEEK II

Day 1

Generalize relationships of traits, abilities, aptitudes, and interests, experiences and habits that make one better employee and friend.

Define each of the qualities showing considerations of others that make for friendship and employability.

Educational experiences contribute to a persons qualifications for employment.

One needs more than interest to suceed in a job.

Discuss why students leave school.

Relate to employment barriers and lack of wages.

What are ways to encourage young people to stay in school. What would they do if they dropped out?

Work on bulletin board and panel.

Day 2

Be aware of legal requirements for working--social security, age, hours, income tax, as applied to students.

What traits do employers look for in you?

Experience in part time and summer jobs helps students choose vocations wisely.

Why is resume important to you and to employer.

Be aware that an employer expects return for money you are paid.

Securing a job is easier when one is familiar with the methods used in locating employment and when one has knowledge of the requirements.

Discuss resume and job application forms.

Write a resume. Look at examples.

Fill out job applications.

Collect essays on jobs or job areas.

Day 3

Know about Social Security numbers and how to obtain them.

Know about work permits, where and how to obtain.

Physical restrictions apply to certain jobs--marital status, age, dependents, experience, physical limitations, appearance, unions.

When one has knowledge of conditions his job choices are more likely to be rewarding.

How monetary factors such as pay, tips, commissions, discounts, effect occuaptional choice.

Time factors such as hours, overtime, vacations, physical activity, tools, and machines to be used.

Opportunities for friendships and personal satisfactions may influence choice.

Benefits such as sick leave, maternity leave and pensions effect choice.

Hand out ditto sheets on women's working.

Discuss the forms in light of content.

Discuss the interview for a job.

Have an employment agency representative give views on obtaining a job and interviews.

Written questions from class on vocations.

This to be dittoed and handed out at end of period to students as outline and suggestions for discussion

Student: Read and study the following material

DEVELOPING QUALITIES FOR FRIENDSHIPS AND EMPLOYABILITY

I.. Developing self-knowledge related to qualities for friendships and employability

A. Sources of personal informations
   1. Teachers, counselors, and others
   2. Records of attendance, grades, behavior
   3. Tests of achievement, intelligence, abilities, interests, personality
   4. Intuition

B. Sources of occupational information and guidance
   1. Counselors, employers, workers, and others
   2. Advertisements, pamphlets, books
   3. Public and private employment agencies, placement office.

C. Personal qualities related to friendships and employability
   1. Physical qualities which affect friendships and employability
      a. health status
      b. Strength, energy, stamina
      c. Age
      d. Height and weight
      e. Posture
      f. Voice and speech
      g. Appearance, grooming
      h. Physical handicaps
   2. Psychological resources for friendships and employability
      a. Mental health
         1. self-confidence
         2. optimism
         3. Freedom from fears, tensions, anxieties
         4. Freedom from jealousies, resentments
      b. Intelligence, general mechanical ability to follow directions
      c. Emotional maturity
         1. Self-dicipline
         2. Judgment
         3. Initiative
         4. Acceptance of criticism
         5. Responsibility
      d. Attitudes toward people, things, school, work
         1. Respect
         2. Enthusiasm
         3. Sense of humor
         4. Other
      e. Character traits
         1. Honesty
         2. Integrity
         3. Fairness
         4. Trustworthiness

3. Social capabilities which influence friendships and employability
   a. Ability to communicate
   b. Enjoyment of people
   c. Leadership
   d. Consideration for others
      1. Empathy
      2. Courtesy
      3. Tact
      4. Loyalty
      5. Tolerance
      6. Acceptance of differences
      7. Manners
      8. Patience
      9. Generosity
4. Habits which influence friendships and employability
   a. Neatness and cleanliness
   b. Mannerisms
   c. Use of time, punctuality
   d. Management of money and energy
5. Interests and preferences which contribute to friendships and employability
   a. Reading
   b. Recreation
   c. Groups/clubs, activities
6. Special skills and abilities which contribute to friendships and employability
   a. Sports
   b. Art
   c. Music
   d. Drama
   e. Dancing
   f. Cooking
   g. Sewing
   h. Woodworking
   i. Others
   j. Relation of interests and abilities
7. Experience and opportunities for developing qualities for being a friend and an employee.
   a. Education and training
   b. Activities at school, home, and in groups
   c. Travel
   d. Wage earning experiences
   e. Acquaintances with variety of people
   f. Financial resources
8. Personal values that relate to employability and the development of friendships
   a. Ethical principles
   b. Outlook on life, purposes, and goals
   c. Expectations for home and occupational life
   d. Concept of success

II. Making a self-assessment in relation to being a friend and obtaining employment
   A. Assessment of qualifications
      1. Assets, strengths
      2. Weaknesses, handicaps, deficiencies
   B. Acceptance of strengths and limitations
   C. Exploring occupational preferences
      1. Identifying areas of interest
      2. Analyzing qualifications
      3. Making tentative decisions
      4. Planning for decisions making

III. Using self understanding to develop qualities for keeping friends and holding a job
   A. Overcoming dificiencies
   B. Changing habits
   C. Developing new strengths
   D. Expanding interests

WEEK III

Day 1

Job differ in requirements such as intelligence, mechanical ability and ability to follow directions.

When person knows abilities he has a basis for making appropriate plans relating to occupations.

One indicates through preferences his values.

One's qualifications are enhanced by special skills and abilities in areas of sports, arts, music, drama, dancing, cooking, sewing, woodworking, etc.

Class discussion.

List interests.

Show how interests might relate to an occupational area.

Do a job opinion poll.

For following class period: one page essay "What My Life Will Be Like In 10 Years From Now."

Day 2

Realize that each family is individual.

Mothers working outside the home cause differences and problems.

Identify role of women in world of work.

Relate trend toward early marrage and parenthood.

Outside agencies have assumed responsibility to care for children at an earlier age.

The changing status of women is resulting in greater freedom and equality in vocational opportunities.

More jobs are being opened to women.

Though marriage is a major goal for many girls, deeper considerations is being given to the development of vocational skills which will serve them before and after marriage.

Panel by students on working and nonworking mothers.

Why do women work?

Are women too independent today?

What about the women's liberations movement?

What are poor reasons for seeking employment?

Under what conditions would it be understandable for women to seek employment?

What values cause women to seek employment?

What extra expenses result from women working?

Relate unit.

Day 3

Evaluation

Mastery Test

OPINION POLL -- A SUGGESTED EVALUATION DEVICE

Directions: This opinion poll is concerned with your feelings about working situations. Check those statements with which you tend to agree in the first column; check those with which you tend to disagree in the second column.

	Tend to Agree	Tend to Disagree
1. Pay is the most important consideration when deciding upon a job.		
2. If a typist gets her required work done ahead of time she should be able to leave the office early.		
3. Being an "eager beaver" is the way to succedd on a new job.		
4. Supervisors have the right to criticize employees about their clothes.		
5. Sales people should be allowed to chew gum if they enjoy it.		
6. It takes careful planning to be punctual.		
7. Wearing metal hair clips to work is considered poor grooming.		
8. One should attempt to establish close relationships with co-workers early in employment.		
9. It should be permissible to make personal phone calls if work slackens.		
10. A worker's criticism of a superior is harmless, providing it is done in private.		
11. Employees have the right to talk back to their employers whenever they feel they have been treated unjustly.		
12. Employees should be able to have inexpensive business supplies for personal use without feeling guilty.		
13. Failure to notify an employer when absent from work is a major offense.		
14. Getting along well with people is just as important as the ability to do a job well.		
15. Griping is a harmless way of getting rid of unhealthy emotions.		

	Agree	Disagree
16. Most jobs are boring.		
17. During periods when work slackens it is wise to "look busy".		
18. Education and training are over-estimated by employers.		
19. Workers should not attempt to do something unless they are specifically told to do so.		

This may be used as a pre-test of student attitudes.
Can be used as a guide for class descussion.

3. Dietician
4. Institutional food service manager
5. Caterer
6. Technician in food research laboratory
7. School lunch manager
8. Home economist for business enterprise, demonstrator
9. Cooking school teacher, director
10. Teacher of adult education courses in foods
11. College teacher of foods, nutrition
12. Nutrition consultant for social agencies, businesses

III. Home and Industrial Management and Supporting Services

A. Accupations requiring High School training
1. Homemaker's assistant part or full time in private home
2. Housekeeping aide in nursing or rest home
3. Hospital housekeeping aide
4. Hotel or motel housekeeping aide
5. Visiting homemaker for elderly or handicapped person
6. Management aide in public housing project
7. Manager of home in absence of wife or mother
8. Personal shopper
9. Companion for elderly person
10. Information clerk in nospital
11. Receptionist in hospital or nursing home

B. Occupations requiring advanced training or higher education
1. Supervisor, manager of rest home
2. Family financial advisor
3. Teacher of adult education course in management
4. College teacher of home management house
5. Director of home management house
6. Manager in public housing project

IV. Home Furnishings, Equipment, and Services

A. Occupations requiring Hign School training
1. Sales person in furniture store
2. Florist helper
3. Demonstrator of equipment and products
4. Research technician in laboratory testing products and equipment
5. Appliance sales person
6. Assistant to drapery or slip cover seamstress
7. Sales person in fabric shop
8. Drapery, slip cover seamstress, self-employed
9. Upholsterer helper
10. Sales person in drapery shop

B. Occupations requiring advanced training or higher education
1. Manager of small home furnishing business
2. Buyer of home furnishings in department store
3. Interior designer, consultant
4. Kitchen planner, consultant
5. Furniture designer
6. Landscape planner
7. Floral designer
8. Consultant for manufacturer of equipment
9. Research technician in equipment testing laboratory
10. Window trimmer
11. Real estate consultant

V. Clothing Management, Production, and Services

A. Occupations requiring High School training
1. Fitter or seamstress in clothing alteration
2. Clothing service aide
3. Dressmaker's assistant
4. Dressmaker,,self-employed
5. Worker in a garment factory
6. Worker in laundry, cleaning establishment (alterations)
7. Manager of coin-operated dry cleaning establishment
8. Sales person in dress shop
9. Sewing machine demonstrator
10. Fashion model

B. Occupations requiring advanced training or higher education
1. Research assistant in textile laboratory
2. Textile designer
3. Buyer of dresses in department store or dress shop
4. Fashion designer
5. Fashion journalist
6. Consultant to manufacturer of laundry products and equipment
7. Manager of dress shop

VI. Combination of Home Economics Areas

A. Occupations requiring advanced training or higher education
1. Teacher of home economics classes in high school, college, or adult education
2. Extension worker, home adviser
3. Editor or assistant in publishing magazines, newspapers, business literature
4. Advertising editor, writer
5. Coordinator, writer for radio and television programs
6. Demonstrator on television
7. Homemaking consultant
8. Writer of women's columns, homemaking books.

VII. Other Related Occupations

A. Occupations requiring High School training
   1. Cosmetology, hairdresser apprentice
   2. Welcome Wagon hostess, visitor of newcomers
   3. Salesperson, demonstrator of cosmetics
   4. Gift wrapper

B. Occupations requiring advanced training or higher education
   1. Airline, bus, or train hostess
   2. Cosetologist, hairdresser
   3. Manager of beauty shop
   4. Window trimmer
   5. Floral designer
   6. Adult teacher of flower arranging

CHILD CARE OCCUPATIONS: CLASSROOM

A Paper

Presented to

Dr. Louise Smith

Northern Illinois University

By

Doris O'Hara

3098

RATIONALE

Students who leave high school today must find a job in our society. Boys and many girls need to find a rewarding job in which they will spend many days of their lives earning money. Training for a job related to child care occupations offers a student an excellent opportunity for employment after high school and valuable experience for their future families.

This course is designed for juniors as a prerequisite to the home economics occupations on-the-job training program in child care offered to 12th grade level students at the Whiteside Area Vocational Center (WAVC). Students at the WAVC will receive classroom instruction and on-the-job training in nurseries and day care centers in the Sterling-Rock Falls area. Some students will receive training at the Dixon State School for the mentally retarded. The students will work with children 14 years of age and under.

The course content and textbooks were decided at an all day meeting of all home economics teachers teaching in schools that participate in the WAVC. The students in each school will receive approximately the same instruction. This will help to give the students the proper start toward their on-the-job training the following year.

The developmental tasks from Developmental Tasks and Education by Robert H. Havighurst which apply to this course are:

1. achieving assurance of economic independence.
2. selecting and preparing for an occupation.
3. preparing for marriage and family life.

After completing this course, the students should have a start toward mastering these developmental tasks of adolescence. In addition, the students will be familar with the developmental tasks children must accomplish as they grow.

The text used for the course is entitled Child Care and Development by

Louise Bates Ames. The text was first printed Spring of 1970 and is presented in a unique manner. The book is written to tell the students things they need to know about young children and about the students themselves because human behavior is all of one piece. It states its information from the developmental point of view. There is no division by ages. Instead the child grows up all in one piece. The text was chosen because of this approach to child care and the developmental tasks of children.

There is no prerequisite for this course in child care occupations. It is open to both boys and girls of junior and senior standing. The juniors will be the only ones who can participate in the training program. However, the seniors taking the course will receive valuable information about caring for children and give them a knowledge of employment opportunities. The class will meet everyday for 80 minutes.

In the immediate Tampico area there are very few opportunities for employment. Most high school students earn money by babysitting. Many mothers work in nearby factories such as General Electric or clerk in stores in Sterling-Rock Falls. Students babysit after school and all day during the summer. This course will also help students with future employment experiences while in high school.

OVERALL OBJECTIVES

1. Have a functional understanding of the basic concepts of child development.
2. Develop a positive attitude toward children.
3. Accept children as individuals.
4. Understanding of the continuing effects of both heredity and environment.
5. Have the ability to plan, prepare, and serve simple nourishing meals and and snacks for children.
6. Be capable of directing individual or group activities of children such as story telling, games, play, and various creative experiences.
7. Understand the selection, use, and care of various games, play apparatus, toys, and supplies.
8. Recognize that caring for children is an important worthwhile job.
9. Be familiar with employment opportunities in this field.
10. Have an acquaintance with various types of child care facilities and standards required.

BASIC CONCEPTS

1. Behavior cycles
2. Individuality
3. Prenatal Development
4. Physical Development
5. Intellectual Development
6. Emotional Development
7. Routines in a child's life
8. Living in a family unit
9. School and the child
10. The child with problems
11. Employment opportunities

BLOCK PLAN--CHILD CARE OCCUPATIONS: CLASSROOM

JOB-ORIENTED CHILD-CARE

Overview

Job-oriented child care has been developed to extend the curriculum into the area of gainful employment in accordance with the vocational acts of 1963 and 1968.

The course, available to girls in grades 10, 11, and 12, will deal with the 2-5 year old child only as this is the greatest age group found in most child care centers.

This unit is one semester, two hours daily. A following unit will take the student into child care centers for the work related cooperative program.

UNIT I

RELATIONSHIP WITH CHILDREN

"If you're serious about building a better relationship, stop calling him Charley—his name is Fred."

JOB-ORIENTED CHILD CARE

(A Semester Course)

10th, 11th, 12th Grade Level

UNIT I: RELATIONSHIP WITH CHILDREN

Major Concept: The primary purpose of the family and society is the total development of the individual from infancy to maturity.

Objectives:

1. To recognize the relationship of the family background to the adjustment of the individual into society.
2. To appreciate the role which the family substitute may play in the care of the child in our society.
3. To be aware of the various employment opportunities related to the care of the child and his development.

Generalizations	Course Content
In all known societies there is a recognized unit that assumes the functions of child bearing, regulation of behavior, and economic support.	I. Relationship with Children A. Responsibilities of the family toward the development of the child. 1. Physical responsibilities 2. Cultural & Economic responsibilities
The family is the fundamental unit of our society.	B. Responsibilities of family substitutes toward the development of the child.
Family life provides an avenue for the transmission of cultural patterns from one generation to another.	1. Why family substitutes are necessary a. Economic Reasons b. Physical & Health Causes c. Moral & Cultural Influences
The degree of security which a child develops is determined by the atmosphere of adequacy and acceptance expressed in the family.	2. How the family substitute functions a. Part time assistance b. Full time institutions
The complexity of modern life sometimes makes it necessary for the family to call on others to assist with the care of children.	

Society provides various agencies and individuals to help with the rearing of children.

Good rapport with children will increase the effectiveness of the family substitute. employee.

C. Responsibilities of the family substitute employee toward the development of the child.

1. Sincere liking for children
2. Ability to work cooperatively
3. Ability to communicate with children.
4. Understanding of child development and behavior
5. Skill in directing appropriate activities for children of all ages.

Student Activities:

Read Chapter I of The Developing Child by Brisbane. (This is the student text). Discuss the statement "The Child is the Father of the Man."

View and discuss the following films in relation to responsibilities toward the developing child.

"From Generation to Generation."; McGraw Hill Films, 330 W. 42nd Street, New York
(Shows basic facts of human reproduction using animation.)

"The Deep Well"; Health, Education & Welfare Center, 10 E. 44th St., New York
(Shows foster home program and how to use it.)

Listen to a parent of an adopted child tell of values and problems of adoption

Visit a day care center. Evaluate the role it plays in the development of a child. List the qualities that a worker there needs to successfully do her job.

Evaluation:

In essay form, compare the role of the family substitute to the role of the parent. (This could also be done in graphic form if the student is creative.)

UNIT II

DEVELOPMENT OF THE CHILD

SPOON-FEEDING RHYME

By GEORGIE STARBUCK GALBRAITH

One for the baby;
Two for the floor;
Three for the high chair;
Oops! . . . dropped *four*.

One for his left ear;
Two for his chin;
Three for the baby . . .
I got *that* in!

UNIT II: DEVELOPMENT OF THE CHILD

Major Concept A: The total growth process is affected by the interaction of heredity and environment.

Objectives:

1. To understand the role of heredity and environment in the growth process.

2. To appreciate the type of environment which will best suit the child in his quest to satisfy basic needs and reach full maturity.

3. To contribute to the establishment of a favorable environment which will facilitate growth in the child.

Generalizations	Course Content
The basic pattern of human growth is determined through laws of heredity.	II. Development of the Child A. Heredity and its role in the growth processes of the child. 1. Physical hereditary factors 2. Mental hereditary factors
Patterns of human growth are altered through varying effects of environmental conditions.	B. Environment and its role in the growth process of the child 1. The home environment a. Economic influences b. Cultural influences
The responsibility of the parent is to provide an environment which will lead to satisfaction of the child's needs.	2. The geographical environment a. Climatic influences b. Community influences
The environment of a child care center should reinforce and/or contribute to the satisfactory fullfillment of a child's growth toward maturity.	(1) School (2) Societies & Organizations

Student Activities:

Read and discuss Chapter 2 of Brisbane's The Developing Child, pp 27-30.

View and discuss the following films:

"Baby Meets His Parents", (U of Ill.)
(Shows relation of heredity and environment to personality.)

"Children Around the Globe", (Eye Gate Co.,)
(Showing hereditary and environmental influences.)

Read from numerous books, pamphlets, and articles relating to human reproduction. Write brief summaries of the articles or give oral reports.

Chart hereditary characteristics in the family or bring pictures of family members and point our hereditary characteristics.

Listen to a foreign exhhange student tell of environmental influences on his growth pattern.

Prepare a bulletin board of pictures of children from around the world. Point our influences of heredity and environment.

Evaluation:

Debate the importance of hereditary vs. environment in the development of children.

Major Concept B: In the developmental process, growth is physical, intellectual, emotional, and social, and all are interrelated.

Objectives:

1. To recognize the interrelationship of all appects of growth.
2. To appreciate the laws of sequence and maturation which accomplish general similarities and basic trends of development.
3. To be aware of the patterns of personality development.
4. To discriminate between acceptable and unacceptable behavior patterns...and to help the child learn to discriminate.
5. To assume responsibility for limits of children's behavior and to enforce them at times when the child is too immature to judge consequences of his own behavior.
6. To understand the nutritional needd of children.
7. To assist children in the formation of desirable food habits.
8. To be able to prepare and serve nutritious and appealing meals for children.

Generalizations	Course Content
Each child has a rate and pattern of growth which is individually his.	C. Patterns in the growth process 1. Sequential 2. Individual
Growth follows in basic	D. Parental responsibilities toward creating a satisfactory environment

trends due to laws of sequence and maturation

Clothing for children should be easy to clean not cumbersome, and simple enough for the child to manage.

The home should offer each individual a haven in which he may develop his individual personality.

Play activities are developmental activities and should be so constructed as to lead toward maturity and security in the society.

The child grows as an integrated whole--all aspects of growth are interrelated.

Learning to eat and enjoy a variety of nutritions foods is an important part of a child's development.

Meals for children should be simple, nutritious, attractive and carefully planned.

Personality patterns are influenced by many factors.

Emotions are an integral part of behavior

Adults who understand the growth processes that a child is experiencing are more capable of guiding him effectively.

There is a reciprical relationship between the family and society.

Each individual member affects and is affected by his family.

1. Meeting the child's physical needs.

   a. Food for children
   b. Clothing for children
   c. Housing for children
   d. Activities for children

2. Meeting the child's social needs.

   a. In the family
   b. In peer groups
   c. In the community

3. Meeting the child's intellectual needs.

   a. Speech and language skills

      (1) Reading
      (2) Drama

   b. Cultural development

      (1) music
      (2) science
      (3) art

   c. Creative development

      (1) Crafts
      (2) Imaginative activities

4. Meeting the child's emotional needs.

   a. Sibling security
   b. Parental acceptance

      (1) Discipline
      (2) Behavior

   c. Community contacts

      (1) Church
      (2) Civic Programs

Student Activities:

Following a lecture reviewing growth from birth through two years of age, read and discuss Chapters 10, 11, and 12 in Brisbane's The Developing Child concerning development in ages three to six.

View and discuss the following films:

"Principles of Development", U of Ill.
(Basic laws and patterns of growth.)

"The Terrible Twos and Trusting Threes" and/or
"The Frustrating Fours and Fascinating Fives" U. Of Ill.
(Show personality pattern development)

"Preface to a Life".
(Shows contrast between democratic and autocratic techniques in giving directions and how they relate to behavior)
"Helping a Child Accept the Do's and Don'ts".
(Discipline)
(Both of the above films are available from the Dept of Public Welfare in most states.)

Listen to a librarian talk on children's books. Prepare a book exhibit for parents.

Secure a table of normal heights and weights for young children. Compare with those of children who are in play school group or with a kindergarten group in the school system. Discuss variations in growth and other aspects not so easily measured.

Are we being realistic when we ask all second grade students to buy second grade readers, math books, and size 8 tennis shoes?

View and discuss the filmstrip "Your Child's Intelligence", N.E.A., Washington, D. C., $7.00 with recording of script.

Observe the eating habits of a group in the school lunch program of a primary school. Use the observation for class discussion to identify desirable and undesirable eating habits. Class may develop ways to encourage desirable habits.

Discuss punishment and decide on criteria which might be used to determine whether a certain type of punishment is desirable or undesirable. Use the criteria to evaluate the following:

physical punishment	threats
humiliation	isolation
praise	removal of priviledge
rewards	natural consequences

Evaluation:

A test of the following type may be used as a pre-test and again as an end test to evaluate student values and growth.

TEST ON INDIVIDUAL DIFFERENCES

Directions:

If you strongly agree with the statement, place a "2" in the Agree column.

If you somewhat agree, place a "1" in the Agree column.

If you strongly disagree, place a "2" in the Disagree column.

If you somewhat disagree, place a "1" in the Disagree column.

If you are puzzled as to whether you agree or disagree, place a question mark between the two columns.

Agree	Disagree		
( )	( )	1.	Each child has a tempo and style of growth which are as characteristic of his individuality as are the features of his face or his finger-prints.
( )	( )	2.	The basic pattern of development is the same for all children.
( )	( )	3.	Brothers and sisters in the same family are usually so similar that it is possible to treat them all alike.
( )	( )	4.	Infants are individuals from the moment of birth.
( )	( )	5.	Scientific studies show that the individual charagteristics of infants do not persist into later life.
( )	( )	6.	By the time a child reaches school (5 or 6 years of age) has ways of thinking and working are basically formed.
( )	( )	7.	Children who are intellectually ambitious in their early years tend to remain so as adults.
( )	( )	8.	Very little learning takes place during the pre-school years because the child is too immature.
( )	( )	9.	It is difficult to measure human growth precisely because of its many variations.
( )	( )	10.	Babies are very much alike at birth-the differences which become apparent as they mature are due entirely to environmental factors.

Directions for scoring:

1. Mark statements 1,4,6,7, and 9 as true statements on your

key copy. Mark statements 2,3,5,8, and 10 as false statements on your key copy.

2. On true statements give 10 points for each "2" in the Agree column and 5 points for each "1" in the Agree column.

3. On false statements give 10 points for each "2" in the Disagree column and 5 points for each "1" in the Disagree column.

4. Give no score for question marks.

WHAT WOULD YOU SAY?

(A means of evaluating pupil concepts)

One Pennsylvania teacher devised a quick and subtle way to evaluate pupil concepts. She merely described a simple situation and asked the pupils what they would say to the child involved. Their responses were then placed on the blackboard (without names) and used as the basis for class discussion.

Following is a sampling of some responses which revealed some very inadequate concepts concerning the nature of a two year old:

The situation:

Johnny (age 2½) was so busy playing he forgot to go to the toilet. Now his pants are wet and there is a puddle on the floor where he was playing. WHAT WOULD YOU SAY TO JOHNNY?

"Johnny, be good and try to make it next time."

"Oh, Johnny, you were working so hard that you forgot to go to the bathroom! Try and remember next time. You're getting to be a big boy now."

"Johnny, you should have gone to the bathroom. Now go and change, and then clean it up."

"Don't be ashamed. All little ones do it."

"That's all right, Johnny, I'll clean it up."

"I would ask him to try and be careful, and I would say that he should not play unless he knows when to stop."

"I would say, Johnny, why didn't you tell me so that I could have taken you to the bathroom? The next time you tell me."

"I would say to Johnny that he is a big boy-and big boys don't do that. Tell me next time."

Both evaluation devices taken from Preparing for Employment in Child Care Services in Pennsylvania, pp 49-51.

Major Concept C: Play is the business of children--moving them toward development of full potential.

Objectives:

1. To understand the role of play in the total growth process.
2. To be able to select play materials suited to the age, interest, and ability levels of the children concerned.
3. To learn how to improvize play materials from inexpensive, commonplace materials.
4. To engage in the supervision of creative experiences.
5. To cooperate with children in developing meaningful play activities.
6. To gain the cooperation of children in caring for play materials.
7. To establish a cooperative working relationship with parents in helping toward development of the child.

Generalizations	Course Content
Through play a child discovers his senses and his muscles.	E. The role of play and play equipment in the growth process
Pre-school children need many opportunities for free play.	1. Selecting play materials a. Motor b. Mental
Safety is important when selecting toys for children.	2. Creating play materials
Through play, children learn to cope with their environment.	3. Directing meaningful play a. Safety b. Rules
A child's creativity and imagination can be fostered through experiences with books.	4. Sharing related play ideas with parents
Adult standards and ideas should not be imposed on the child.	
Music activities provide creative outlets for preschool children.	

Student Activities:

Evaluate children's books...bring one to class and report on its value in relation to standards established by the class.

Have a skillful storyteller present a demonstration of story telling to the class.

Practice reading stories orally.

Establish criteria for selection of toys and play materials. Bring a toy to class and evaluate it according to the standards.

Report on one of the following personality characteristics and relate how play could be used to overcome the problem.

shyness	stuttering
baby talk	fear

Participate in the story hour at the public library.

Prepare a simple toy or homemade play media. Examples:

can stilts	gingerbread baking
fingerpaint	rhythum band
candlewax modeling	cutting and pasting

Practice fingerplays and nonsense rhymes to use with children.

Assist in playground supervision.

Evaluation:

A number of the above activities could be used to evaluate the student's understanding of principles of play and of selecting play equipment.

UNIT III

RESPONSIBILITIES IN CARING FOR CHILDREN

"He's awfully quiet. You'd better see what he's doing in the bathroom."

THE SATURDAY EVENING POST

UNIT III RESPONSIBILITIES IN CARING FOR THE CHILD

Major Concept: An effective child care center provides for the entire personailty development of the child and requires teamwork on the part of all persons participating in it.

Objectives:

1. To establish guides for developing a quality child care center.
2. To be able to work cooperatively with others.
3. To learn objectivity in observation.
4. To appreciate desirable activities for child care participants.
5. To develop creativity in planning activities for a child care program.

Generalizations	Course Content
All people have intellectual, emotional & physicalneeds. The school is one institution formed by man to meet these needs.	III. Responsibilities in caring for the child (relating to child care centers).
	A. Purposes of the Child Care Center
	1. Social Experiences
	2. Personal Growth
	a. Self-identity b. Self-reliance
	3. Cultural Enrichment
	4. Safety for the Child
Pre-school attendance can reduce sibling rivalry.	
Pre-school participation may offer cultural enrichment.	
Participation in planning increases interest in a project.	
Participation in planning develops an awareness in problems and objectives.	
Written records provide (1) means of communication, and (2) form a basis for evaluation of a child's progress.	
Objectivity is an important consideration when reporting play school observations.	
	B. Physical Preparation of the Child Care Center
	1. Activity areas
	a. Indoor
	(1) Supervised Activities (2) Free Play (3) Group Activities
	b. Outdoor areas
	(1) Playground equipment (2) Gardens (3) Animal Shelters
	2. Rest

Opportunities for free activity enables a child to develop and explore h his own interests.

Provision for free activity requires variety in and serveal choices among material, equipment, and environment.

A child engages in many different types of activities which contribute to various aspects of development.

The type of storage facilities for equipment and materials affects their condition and accessibility.

Prompt and adequate clean-up at the conclusion of a play time contributes to growth and development of children and to the operation of a child-care center.

Records of health, attendance, field trips, amount of food purchased for a snack or meal affect the operation of a child-care center.

3. Toilet Areas

4. Observation Arrangements

5. Storage Facilities

C. Employee Responsibilities

1. Participation

a. Supervision

b. Observation

c. Operational

2. Objectivity

3. Cooperation

D. Program Development

1. To suit needs of child enrolled

2. To fit into schedule of school program

3. Flexible but planned

Student Activities:

Visit a child-care facility when it is not in operation to inspect the types of equipment and materials included and to evaluate them for a child-care activity in school.

Practice writing brief objective anecdotal reports of incidents occurring in the nursery school. Use them for class discussion and evaluation.

Formulate a guide for trainees to use when guiding play activities in the child-care center.

Develop "Guides for the Observer".

Observe a child, using the observation guide and report findings.

Evaluation:

Observe students as they guide children's activities.

Each student lists ways she uses principles of guidance when supervising the children.

Student References:

Budget Guides for Day Care Centers. State of Ill., Dept. of Children and Family Services.

Wylie, Joanne, A Creative Guide for Pre-School Teachers.

UNIT IV

OCCUPATIONS RELATED TO CHILD CARE

"I'm the sitter. They're donating their services."

UNIT IV OCCUPATIONS RELATED TO CHILD CARE

Major Concept: Child Care Occupations offer a range of work potential in most communities to an individual with less than professional training.

Objectives:

1. To examine the possible phases of child care occupations.
2. To determine the skills needed by an employee in child care occupations.
3. To develop effective skills for an employee of child care institutions.
4. To evaluate the security of occupations which relate to child care.
5. To develop habits and attitudes which will lead to successful employment.

Generalizations	Course Content
Legal regulations control agencies and institutional groups which have assumed functions previously performed by families.	IV. Occupations Related to Child Care A. In the home 1. Sitter
Characteristics of physical, social, emotional, and mental development contribute to employability.	2. Parent Helper 3. Foster Parent
An understanding of other people's viewpoints is conducive to harmony in human relations.	B. In Centers 1. Day Care 2. Institutions a. Orphanages b. Hospitals
Understanding of employer-employee roles clarifies responsibilities and duties of personnel.	C. Criteria for child care employee 1. Personal Qualities a. Grooming
In the process of self-development the individual builds up a set of values which are important criteris for his working relations with others.	b. Personality c. Work Habits
Some of the most influential and compelling values are held unconsciously.	d. Social Standards

Grooming and personality will directly relate to the acceptance of a potential employee.

D. Employee-Employer Relations

1. He is boss
2. He is human
3. Rules of work
   a. What he may expect of you
   b. What you may expect of him

Student Activities:

Write a resume of your qualifications which make you a desirable employee.

Do a term paper evaluating one occupation relating to child care in depth.

Interview child-care employees and/or employers of various levels of responsibilities to determine kind and amount of training, education, and experience needed for employment.

Study references for requirements for various job levels.

Evaluation:

Student reacts to "How I Feel about Working with Children as Long Range Employment."

An end test including test questions of the following type would begin to establish evidence of student acceptance of the standards in the world of work.

T F

___ ___ 1. Occupational requirement ratings and our own ratings should compare favorable in most areas before we decide to pursue the occupation.

___ ___ 2. Publications such as magazines, newspapers, and pamphlets are good sources for judging occupational trends.

___ ___ 3. The primary issue or consideration in choice of an occupation should be the starting salary or wage.

___ ___ 4. We may find that our choice of vocation is a poor one because it does not adequately challenge us, a possibility that would be indicated on a rating chart of abilities when our personal ratings are higher than the demands of the job.

T F

___ ___ 5. There is little value in studying an occupation carefully and then discarding it as an unlikely choice.

A P P E N D I X

Train up a child in the way he should go, and walk there yourself, once in a while. —JOSH BILLINGS

SUGGESTED OUTLINE FOR THE STUDY OF AN OCCUPATION

1. Defination and code number of the occupation.
Use the definition given in the Dictionary of Occupational Titles, but interpret the definition in your own words.

2. What does the worker do?
The information given in the Dictionary of Occupational Titles describes what workers do generally in the United States. Look up other sources for the same kind of information. Visit local workers to get first-hand information about the tools and equipment they use. Explain what products or services result from this occupation.

3. U.S. Census data.
Find the most recent data about the number of men and women employed in this occupation. The Bureau of the Census furnishes occupational summaries for states, and for cities of 100,000 population and over. Consult your librarian for Census materials. The local Chamber of Commerce will supply data on local jobs.

4. Outlook for this occupation.
Consult the Occupational Outlook Handbook for references which will help in estimating the supply of workers, the changes likely to be made in the occupation in the future, the chief locations of the work and the trends expected.

5. Licensing and certification.
Does this occupation require workers to be licensed or certified? If so, what are the requirements in your community? Some occupations have no requirements of this type. Is this occupation unionized?

6. Geographical location of work.
Is this occupation open in your community or state? Must you move to another location for employment? Does the size of your community affect the availability of this occupation?

7. Working conditions.
Describe briefly the nature of the place in which the employee works...noisy, quiet, hot, cold, humid, dry, clean, dirty, etc. Note whether the work is seasonal. Are there busy times and dull seasons? Mention the hours of work, amount of night work, work in bad weather, unemployment, health risks, hazards, accident records, safety measures, and similar factors.

8. Pay and promotion.
Earnings are difficult to estimate unless recent studies of salaries have been made. Employers seldom reveal salaries, except in the range for beginning workers. Beginning wages should, therefore, be expressed in ranges "from$__ to $__." Also mention whether the pay includes tips, comissions, and other extras. What are the possibilities for advancement? What expeeience is necessary for the first promotion? What related occupations could this job lead to?

9. Requirements for the job.
These would include age, physical requirements, mental requirements, educational requirements and schooling. Do employers use tests of aptitude or ability for selecting workers? Are there requirements as to skill, initiative, judgement, and so forth?

10. Preparation for the job.
How should a person prepare for this occupation? What school courses are necessary and what are the tuition costs? Can the work be learned through vocational schools, work-experience programs, or apprenticeship? How long is the training program? What hobbies contribute to the preparation? What agencies can give information about training? Make a list of the schools in your state that offer instruction in this work.

11. How is employment found?
How do applicants for this work get their jobs--by personal application? by examination? through friends? through the employment office?

12. References for further study.
List the books and pamphlets that you have used in making this study. List associations and agencies that promote the work and provide information as a public relations service. List the names of local individuals who are likely to help young people with information about this occupations.

Adapted from suggested outline by Walter Greenleaf in Occupations and Careers, pp 156-157.

FINGER PLAYS and NONSENSE RHYMES

Good Morning

One day I saw a downy duck,
With feathers on his back;
I said, "Good-morning, downy duck,"
and he said, "Quack, quack, quack."

One day I saw a timid mouse,
He was so shy and meek;
I said, "Good-morning, timid mouse,"
And he said, "Squeak, squeak, squeak."

One day I saw a curly dog,
I met him with a bow;
I said, "Good morning, curly dog,"
and he said, "Bow-wow-wow."

One day I saw a scarlet bird,
He woke me from my sleep;
I said, "Good-morning, scarlet bird,"
And he said, "Cheep, cheep, cheep."

My Garden

I dig, dig, dig;
I plant some seeds,
I rake, rake, rake;
I hoe some weeds.
I wait and watch,
And soon right there
My garden sprouts---
It's in God's care.

Two Little Blackbirds

Two little blackbirds sitting on a hill,
(Hands closed with thumbs straight up for birds.)
One named Jack, (Wiggle one thumb)
The other named Jill, (Wiggle other thumb).

Fly away Jack, Fly away Jill
(Toss one hand at a time over shoulder)
Come back Jack, Come back Jill.
(Bring hands back one at a time.)

Bunny Song

Here is my bunny with ears so funny
And here is his hole in the ground.
When a noise he hears,
He pricks up his ears,
And jumps in his hole with a bound.

(Right fist forms bunny and two fingers his ears. Left hand closes to make a "hole".)

HOMEMADE PLAYTHINGS FOR THE PRESCHOOL CHILD

Hilda Dudieiak
University of Illinois

Train

A. Frozen fruit juice can or baking powder can
B. Band aid can, spice can or cocoa can

Sand board, glue on cans and paint. A strong cement will last if it is given enough time to dry thoroughly. Add a screw eye. The hook is put on the next part of the train. Similiarly, on oil tank car or coal car, using a sardine can, may be made. Use floor gliders or upholstry nails on the bottom of the boards for easy maneuvering. Wheels may be added if desired.

Take-Apart Tug Boat

A...1" dowels, finished and removable
B,C,D...each piece of wood finished, proportioned to the piece used as the base.

Sand wood so there will be no sharp corners. Finish with varnish, paint or lacquer. Add a screw eye for string or cord, and gliders. Holes for dowels should be sanded so that dowels will slip in and out easily. Bore holes into base piece only ½ of the way so dowels will not slip through. Cost depends upon tools and supplies on hand.

"Sugar, Jerry?"

"More sugar?"

"More?"

"Is that too sweet enough?"

A Play Test Worth Giving

A toddler's readiness for the 3 R's can be shown by the 4 E's

Age 4 years is the suggested time to play the game and test.

As a game the 4 E's is fun! It offers a child the psychological lollipop of mother's undivided attention and, if the child wins (3 out of 4 do so easily), a sense of accomplishment.

As a test the 4 E game has a double purpose:

1) If the child wins you have the welcome reassurance that his eyes are as sharp as they are shining—that he sees as well as most children do—and, most of all, sees well with both eyes.

2) If the child fails to win—can't see the smallest of the 4 E's at a distance of 20 feet—you have a timely warning that his vision is not up to par and should be checked out by a medical eye examination.

Here's how to play the 4 E game:

Step 1: You order the official game and full directions by mail (see box at the end of this article) and prepare an eye cover card according to directions.

Step 2: You show the child (who keeps both eyes open) how to perform his part by doing it yourself and helping him copy-cat your motions (see directions).

Step 3: And this is both the game and the test, given with one of the child's eyes covered. You display the 4 E's in four different positions (legs up, down, to the right and to the left) at the distance of 20 feet. In each instance the child shows with his arm the direction in which the legs are pointing.

Some children will complete the game first time around. Others will start well and then goof-off. When this happens it's best not to urge. Try again!

Goal: for the child to see the littlest E in all 4 positions. It's a cinch for some children.

Of course, some can't win! It goes without saying that even though you will be naturally concerned at failure, the child should not be made to feel out-of-it!

The same day you play the 4 E game is none too soon to start arranging for an examination for the child who can't win. You will probably want to talk first with your pediatrician and follow his recommendations as to an eye specialist or an eye clinic.

To get the game which includes a chart of the four E's and directions for use: Send 25¢ to Prevention of Blindness Society, 917 15th St., N.W., Washington 5, D.C., requesting "Check Your Eyes."

3132

GROWTH AND DEVELOPMENT

PRINCIPLES OF DEVELOPMENT

It is important that you, as a child care aide, have an understanding of the basic characteristics or principles of development. These principles are:

* Development is similar for all--The infant's head becomes functional before his hands. He uses his mouth, eyes, and ears before he can grasp objects. He becomes somewhat skillful in using his hands before he learns to control his feet.

* Development proceeds from general to specific responses--The baby waves his arms freely before he is capable of reaching for a specific object.

Here are the five little pigs who went off to market, Fig. 1 --the small one who cried all the way home, Fig. 2, and the four more jolly-looking members of his family, Figs. 3-6.

Trace the pigs and color them. They look well with rosy cheeks and pink noses and ears. Choose a color for the bow in the first pig's bonnet, Fig. 3. Then fold each head along the dotted lines, pasting each tab inside the back section and also pasting together the ears of the two sections. When the paste has dried, put each head over the proper fing and you are ready to tell the story of the five little pi Fig. 7.

With a set of pigs finished, try drawing rabbits, nam them Flopsy, Mopsy, Cotton-tail, Mrs. Rabbit, and Pet like the characters in "The Tale of Peter Rabbit." (CHILDCRAFT, volume 3, pages 37-42.) Then you can pa the heads and use your puppets to tell the story of Pe Rabbit.

NATIONAL BUREAU OF STANDARDS-1963-A

Introduction

When vocational home economics programs were introduced more than 50 years ago, recognition was given to the importance of studying children in the family and to the role of the family in nurturing and protecting them. In the past years, American society has emphsized the importance of education for parenthood.

We have recognized the importance of the study of children in the family as witnessed by the newly implemented child development program offered to students at the secondary level. At this time, it is felt that this course and laboratory situation can further help in meeting the needs of students.

That need is for exposure to varying fields of gainful employment. Along with the exposure to various fields should come an opportunity to receive training for entry into a chosen occupation. It is also possible that this training would open the door to further education or training in a related field.

In addition to the child care related instruction, students in the program will be given information concerning work habits, attitudes, maney management, and job acquiring skills.

This proposal is for the introduction of a cooperative work-training program into the high school home economics curriculum.

Need

Student need in the community for increased opportunity has been demonstrated by the number of students graduating from high school without any plan for further training, education or employment. Many local students are unemployed or underemployed as a result of dropping out of school before graduation. We have a significant number of basic

humanities students who would benefit fron this exposure to and opportunity for training.

There is a growing need for child care workers in this community. At present, there are four licensed day care centers, 3 co-op nursery schools, 1 full-time migrant nursery school and two church nursery schools operating, in addition to the kindergartens of the school district. All facilities have expressed a desire for trained child care aids to be added to their staff. In addition, home care is also becoming more desired.

The need for trained woman-power is increasingly recognized as critical as women of today assume their dual role as homemaker-employee. In keeping with the philosophy of home economics education, it is our responsibility to provide training for gainful employment to these women.

Local school interest has been instrumental in encouraging this program. Counselors have expressed a need for more co-operative work programs for the girls in the student body. Administrators, particularly at the primary levels advocate the training program as they recognize the need for more adequate pre-school care and training.

The students, both boys and girls, have enrolled in the child development program to the extent that enrollment has been limited. Many students have expressed a desire to enter into a cooperative work training program in a child development-related area.

Survey

A home economics advisory committee should be formed to function in an advisory capacity in program policy, content and direction. It would be desireable to have one member of this committee also serve on the vocational advisory committee.

A survey of the student body and the community will also help in determining more concrete direction for the program. Included are possible surveys to be used.

The state employment office, community organizations and tentative employers will also serve as invaluable resource people for this program.

Implementation

Implementation of the program would include two distinct phases. Phase I of the program would go into effect during the 1970-71 school year. General home economicsI, currently offered to freshman students, would be restructured to include emphasis in vocational orientation, in all home economics areas, including day care. Job description, personal characteristics and job opportunity will be stressed.

Child development IIA and IIB would be offered, as planned. Again, emphasis on vocational orientation and opportunity along with marketable skills would be emphasized in the program.

Phase II would be initiated in the 1971-72 school year. Level III and IV of the child development program would be added to the curricul cirriculum. This would include the cooperative work program with related classroom experience.

Scope

Level I child care will be included in the general home economics I course at the ninth grade level. Areas in foods and nutrition, clothing grooming, personal relationships , home furnishings and management and child care will include introductory occupational information and experiences.

Level II Child Care will be included in specific semester courses with further orientation to occupational opportunities and skills.

Major emphasis in child careIIA will be needs,growth, development, behavior and guidance of children from the ages of 2-5, types of

care services in this community and skills needed to enter these 141 occupations.

Child care IIB will focus on the needs, development, behavior and guidance of the child from conception to the age of two. The parental role and responsibility will be used for reference.

Level III Child development and care will allow for cooperative employment in a local school district facility. Ideally, this facility would a nursery school or kindergarten.

Level IV child care and development will provide the student an opportunity for employment in a local community facility such as a nursery school, church nursery school, co-operative nursery school or in private homemaker service.

Both level III and IV training will include related classroom experiences in areas of needs, growth, development and guidance of the 6-12 year old child. Areas of special interest such as working with disadvantaged, handicapped, infant nutrition, art activities, science activities, first aid, etc., will be offered to meet individual student needs.

Actual orientation to the occupational world will be carried out in a team teaching situation with other cooperative students and supervisors from the fields of business, agriculture, industrial arts, and health services.

It may be noted that any junior or senior student currently following a college preparatory cirriculum may also elect to participate in this p rogram at any level. Especially at Level III and IV, the student may participate in the work related classroom activity, without entering into a cooperative work agreement. This student will complete an independent study agreement and pursue additional materials of interest, related to his chosen field in child development.

OVERALL OBJECTIVES FOR THE CHILD CARE AID TRAINING PROGRAM
LEVELS I- IV

To develop an increased awareness of the various job opportunities available to a child care aid.

To develop an awareness of and a desire to develop personal characteristics and qualities needed to succeed in a job.

To develop positive attitudes toward work as a part of life and a desireable part of education.

To acquire basic knowledge of needs, growth, development, behavior and guidance of children.

To develop a desire to obtain a job as a child care aid upon completion of the training program or to continue education to obtain a more technical job or profession in child care or in a related field.

JOB DESCRIPTION

Child Care Aid
Under the supervision of a professionally trained child development specialist helps children accept the day-care center and participate in activities suited to their age groups. Helps children remove outer garments and put them in designated places. Supervises children in play activities and creative activities such as painting, clay molding and puppet play. Supervises children in eating, resting, and toileting. Helps children develop habits of caring for own clothing, picking up and putting away toys and books. Helps keep the day-care center clean and attractive. Practices accident prevention and simple first aid.

Curriculum- Level I

EXPLORING EMPLOYMENT POSSIBILITIES AND REQUIREMENTS IN THE FIELD OF CHILD CARE

Unit length: 1 week, to introduce the child development unit

Major Objectives:

To learn charactersiticsand responsibilities of a skilled employee in child care service.

To increase in knowledge of the requirements and responsibilities for employment in the field of child care.

To become familiar with various opportunities for employment in the field of child care.

Major Generalizations:

Child care is a rapidly expanding field for employment demanding proper training of people seeking accupations in the field.

The amount of education, experience and responsibility of employees in child care occupations varies, resulting in different programs and child care facilities.

The special characteristics which help one to work well with children may be developed through study and work experience.

Content:

I Purposes of and needs for child care services
- A. History of the nursery school
- B. Definition of child care services
- C. Purposes of child care
- D. Local child care facilities

II Opportunities for employment
- A. Level of training
- B. Places of employment
- C. Job descriptions and responsibility

III Personal qualifications of employee
- A. Health
- B. Personal habits
- C. Appearance
- D. Communication Skills
- E. Emotional behavior

Curriculum- Level IIA

Course length: 1 semester

THE DEVELOPING CHILD - TWO THROUGH FIVE

Content:

I Reasons for developing skill in caring for children
- A. Benefit to child
- B. Contribution to preparation for adult role
- C. Contribution to teenagers' self understanding
- D. Contribution to preparation for child care training
  1. Community needs
  2. Employment opportunity
  3. Training necessary

II Development of the child through play
- A. Meaning of development
- B. Types and changes of development
- C. Causes for development
- D. Rate of development
- E. Characteristics of development
- F. Importance of play
  1. Types and stages of play
  2. Toys and play equipment
     - a. Selection
     - b. Safety

III Needs of the preschool child
- A. Physical
  1. Nutrition
  2. Sleep/rest
  3. Exercise
  4. Toileting
- B. Intellectual needs
- C. Emotional needs
  1. Security
  2. Other needs, including love, protection, independence, guidance, control, faith.
- D. Sociological
  1. Cultural demands
  2. Hereditary influences
  3. Environmental influences

IV Development of the preschool child
- A. Physical growth and development
  1. Definition of physical growth and development
  2. Sequential pattern of physical development
  3. Individual differences
  4. Interrelationships of physical development with intellectual, social and emotional development
- B. Motor development
  1. Definition of motor development
  2. Interrelationship with maturation and intellectual development
  3. Need for motor development
  4. Motor development of different body parts

5. Motor skills
   a. Hand skills
   b. Feeding
   c. Dressing
   d. Writing
   e. Ball throwing and catching
   f. Block building
   g. Walking

C. Emotional Development
   1. Role in child's life
   2. Pattern of development
   3. Characteristics of emotions of children
   4. Common childhood emotions
      a. Fear
      b. Anger
      c. Jealousy
   5. Factors influencing emotions
   6. Coping with emotional situations
   7. Supporting emotional development through play

D. Social development
   1. Definition of social development
   2. Patterns of social development
   3. Ways children learn social development
   4. Individual differences
   5. Sequence of social development
   6. Aiding social development through play

E. Intellectual development
   1. Determining intellectual development
   2. Factors in intellectual development
      a. Language development
      b. Development of reasoning power
      c. Development of creativity
   3. Sequential patterns of intellectual development
   4. Individual differences
   5. Encouraging intellectual development through play

F. Speech development
   1. Pre-speech
   2. Learning to speak
   3. Patterns of development
   4. Tasks of speech development
   5. Factors in speech development and variation
      a. Health
      b. Intelligence
      c. Socio-economic status
      d. Sex
      e. Family relationships
      f. Bi-lingualism

V Routine care for the young child

A. Eating habits
   1. Adequate diet
   2. Form and amount of food
   3. Flavor of food

B. Toileting routines

C. Cleanliness
   1. Need for established routines
   2. Bathing
   3. Dental hygiene
D. Sleep routines
   1. Regulation of routine
   2. Bedtime fears
   3. Physical conditions for sleep
E. Dressing routine
   1. Developing independence
   2. Clothing selection for young children

VI Learning Experiences at the preschool level
A. Art experiences
   1. Variety of experiences
   2. Equipment and supplies
B. Science experiences
C. Musical experiences
   1. Selection of experiences
   2. Rhythm instruments
D. Arithmetic experiences
E. Language development experiences
F. Health experiences
G. Field trips
H. Children's literature
   1. Book selection
   2. Story telling
   3. Types of literature

VII Child Safety
A. Burns
B. Poisoning
C. Falls
D. Falls in water
E. Cuts
F. Respiratory trouble
G. Bites
H. Traffic accidents
I. Electrical shock
J. Health emergencies in the day care center or nursery school

Curriculum- Level IIA
Objectives and Generalizations

I To value gaining skill in caring for young children
To sense how caring for children can help a teenager gain self understanding
To comprehend that the experience of caring for young children can provide a basis for parenthood and adult occupations

When teenagers are skilled in caring for small children, both the children and teenagers benefit from the experience.

Experience in caring for children can provide valuable background for parenthood and future occupations.

Experience in caring for children can provide opportunity to develop self-understanding.

II To realize that each child is individual in his growth and development
To comprehend that growth and development of each child is influenced by his biological inheritance and the opportunities provided by his culture.
To use information about the growth and development of 2-5 year old children in caring for them during play.
To value the contribution of play to growth and development of children

The growth and development of a 2-5 year old child is physical, intellectual, emotional and social.
-physical:changes in his body structure and in his ability to manipulate his body
-intellectual: gains in ability to interpret or understand people and situations and to profit by experience in dealing with them
-emotional: progression in expression of feelings and attitudes
-social: increase in ability to perform the behaviors required by his culture.

A child's growth and development is influenced by his biological heritage and by his culture influences.

Child's play which provides opportunities and encouragement for learning appropriate physical, intellectual, emotional and social skills will favorably influence growth and development.

III To become aware of the basic needs of children
To recognize how needs influence behavior of children
To learn ways of providing for the basic needs of children

All children have needs which influence their behavior and develop ment.

Programs and facilities for children should be based on an understanding of the needs of children.

IV To acquire increased knowledge and understanding of the growth and development of children.

To increase understanding of child through observation.

To develop an appreciation for the individual differences in children.

To become aware of how child care workers and child care centers can contribute to the development of children.

Understanding the principles of development gives individuals a basis for guiding children.

The various areas of development are interrelated so that a study of the "whole child" contributes to understanding of children's growth and behavior.

Children need opportunities for experiences which promote their development.

V To apply information about the development of young children in handling situations in their routine care.

To be able to carry out procedures in the routine care of children.

To recognize the importance of maintaining established routines in caring for children.

Routine care of a child, carried out in ways that maintain health and safety, aids in development.

Basic knowledge of routine skills in the child care center, carried out in ways appropriate to a child's stage of development, contributes to his total growth and development.

VI To become familiar with materials and activities suitable for children of various ages.

To develop and increase skill in guiding children's play activities.

To gain more skill in selecting meaningful learning experiences for the preschool child.

Play is one means through which children learn.

The type of play in which children engage is related to their stage of development.

Guidance of play activities requires alterness to provide for both safety and enrichment for the children.

VII To be alert to things in young children's play areas which may be harmful to him.

To comprehend what treatment will minimize the ill effects of various accidents to children.

To be committed to careful supervision of children during play

When a child is taught what things may be dangerous to him and how to deal with them, his health and safety are protected.

When children do have accidents, quick and appropriate treatment can minimize the ill effects of them.

When a person who cares for children can deal with home health emergencies quickly, sensibly and calmly, the child's safety is protected.

Cirriculum- Level IIB

THE CHILD FROM CONCEPTION TILL THE AGE OF TWO- PARENTAL RESPONSIBILITY

Course length: 1 semester

Major Objectives:

To comprehend that all societies recognize the family to assume the function of child bearing, rearing, guidance and economic support.

To understand that the responsibility of parents for their children begins before conception.

To comprehend factors which influence the preparation by parents for a child's birth

To comprehend why adults need to understand the developmental needs of children in their first and second year.

To comprehend that parents have the same kinds of responsibility for children who become members of the family by adoption, foster placement, or remarriage as they do for children born into the family.

To value the contributions which a child and his family can make to one another.

Major Generalizations:

Every society recognizes a unit to assume the function of child bearing, rearing, guidance, and economic support.

Parental responsibility toward children begins before conception.

Parental economics standards,values,cultural background and community facilities influence the preparations made for the birth of a child.

Adults who understand the needs of a child in his first and second year of growth and act to satisfy these needs, contribute to the fullest development of the child.

Parents have the same kind of responsibility for the development of a foster child, stepchild or adopted child.

A family and child stand in an interrelationship with one another in which each gives to and receives from the other.

Content:

I Family setting of the new-born and toddler
  A. Functions of the family for children
  B. Variety in the way responsibility is assumed
  C. Variation in the family life cycle with the entry of children
  D. Ways children become family members

II Adult responsibility for unborn children
  A. Responsibility before conception
  B. Process of conception

III Guidelines for health in pregnancy

IV Adjustment in the family due to pregnancy

V Prenatal Development

VI Adult Responsibility at birth of child
- A. Preparation before delivery
- B. Cost of preparation
- C. Family resources

VII Delivery Process

VIII Responsibility in child's first year
- A. Hospital post-natal care
- B. Care for the baby at home
- C. Physical growth and development the first year
- D. Social and emotional development in the first year
- E. Intellectual development in the first year

IX Adult responsibility the second year
- A. Physical care for toddlers
- B. Interaction of further development
  1. Physical
  2. Emotional
  3. Social
  4. Intellectual

X Responsibility when child enters family other than by birth

XI Contributions of family and child to one another

Curriculum- Level III and/or IV

OVERVIEW TO THE WORLD OF WORK

Major Objectives:

To become interested in the development of competencies for employment

To develop some understanding of today's world of work and the socio-economic conditions and technological developments involved.

To recognize and develop qualities which contribute to securing and holding a job.

To develop some skill in serving effectively in the world of work.

To develop a positive attitude toward work as a part of life and a desireable segment of education.

Major Generalizations:

The occupational revolution has resulted in large numbers of women and youth entering the labor market.

Current Technological changes require training and retraining in order to hold a job.

Effective application procedures contribute to success in acquiring a job.

Being well groomed results in increased self-confidence and respect from others.

Acceptable work relationships contributes to success on the job.

Successful money management contributes to security.

Content:

I Today's Labor Force
- A. Gainful employment
- B. Youth in the labor force
- C. Women in the labor force

II Securing a Job
- A. Job opportunities
- B. Job applications
- C. Community resources

III Success on the Job
- A. Personal appearance
- B. Personal development and attitudes
- C. Payroll deductions
- D. Money management
- E. Labor laws

Cirriculum- Level III and/or IV

THE CHILD AND HIS CULTURE- SIX THROUGH TWELVE

Major Objectives:

To comprehend that a child's development is influenced by the cultural environment in which he grows up.

To comprehend the sequence of physical growth and development that is characteristic of 6 through 12 year old children.

To comprehend that the 6 through 12 year period is especially significant in the total process of a person's intellectual development.

To be able to devise ways of manipulating a child's environment to aid to his emotional development.

To comprehend the significance to a child's total development of his achievement of social maturity at each successive stage of his development

To be able to realize the interrelationshipsof physical, intellectual, emotional and social development.

Major Generalizations:

The cultural environment of a child influences his development.

As children grow and develop, they go through continuous stages of 1 physical growth that follow somewhat,chronological age.

The intellectual development of an individual is typically great and rapid during the 6 through 12 period.

When an adult recognizes his own emotional response to a child's emotions, he tends to be better able to cope with those emotions.

Achieving social maturity- social characteristics and behaviors acceptable in the child's culture at his stage of development- contributes to the child's well-being and to his ability to proceed to the next stage of development..

The physical, intellectual, emotional and social aspects of a child's development are interrelated, each affecting the other.

Content:

I The child, 6-12 Introduction

II Physical Growth and Development of the 6-12 year old child

III Areas of significant intellectual development in the 6-12 year old

IV Emotional development of the 6-12 year old

V Social Development of the 6-12 year old child

VI Special needs and interests

To be decided according to student need, interest, and abilities

A. Art experiences for the pre-school child
B. Science experiences for the pre-school child
C. Music activity for the pre-school child
D. Pre-school nutrition/ food service
E. Working with the handicapped child
F. Working with the mentally retarded child
G. Working with the culturally deprived child
H. In-home care
I. First aid and health education for the pre-school child
J. Teacher aid responsibility in the public school

INTERVIEW SCHEDULE FOR PERSONNEL OF CHILD CARE CENTERS

PERSONAL INFORMATION OF INTERVIEWEE

1. Name_____ 2. Position_____

3. Agency_____ 4. Address_____

5. Telep hone_____

6. List previous experience and/or training which you feel qualifies you for your present position._____

_____

GENERAL INFORMATION FOR THE CENTER

1. Type of care: Infant care_____ Play school_____ Day care_____

Nursery school_____ Kindergarten_____

2. Age of children served: (circle and include number of each age level)

1____ 2____ 2½____ 3____ 3½____ 4____ 4½____ 5____ 5½____ 6____ School age____

3. Total number of children: All day_____ Weekly_____
Morning_____ Drop-ins_____
Afternoon_____

4. Fees charged: Basis and rate of pay.
By the hour_____ By the week _____

By the day_____ By the month_____

5. Do any of the following factors affect fee charges?
Several children in one family_____ Drop-ins_____
Overtime _____ Meals included_____
Irregular schedule _____ Day or night_____
Other (Please specify) _____

6. Total number of staff:
Full time_____ Volunteer_____
Paid_____ Part time_____

7. Rate of pay for the staff:
By the hour_____ By the week_____
By the day_____ By the month_____

WILLINGNESS TO COOPERATE AND PARTICIPATE IN THE TRAINING PROGRAM

Check the desired response or indicate answer for the question in the spaces provided.

1. Do you feel that there is a need for trained child care worker in Dekalb? Yes_____ No_____

2. Would you be willing to work with the local schools in developing a training program? Yes_____ No_____

   If so, in which of the following capacities?
   Serving on an advisory committee_____
   Serving as consultant for class or individuals_____
   Coo erating in providing observation or field trip esperiences_____
   Providing opportunity for work experience_____
   Supervising the development and improvement of skills_____
   Assisting with evaluation of total program_____
   Other _____

3. Would you be will to allow students to observe and assist without pay for a short time? Yes_____ No_____

4. Would you be willing to cooperate in a work experience program for the trainees? Yes_____ No_____

5. What hours would you prefer to use the student trainees?
   Before school _____ After school_____
   Morning_____ Evenings_____
   Noon hour_____ Weekends_____
   Afternoons_____

6. Would it be p ossible for you to cooperate with the trainee in arranging a work schedule to fit her class schedule? Yes_____ No_____

7. How many students could you employ at one time? _____
   Qualify_____

8. Would you be willing to pay the student a fair price or the going rate for child care services? Yes_____ No_____

9. How much would you be willing to pay the student workers?
   By the hour_____ By the week_____
   By the day_____ By the month_____

10. What percentage of a worker's day in your preschool would be spent working directly with the children? _____

11. What p ercentage of a worker's day in your preschool would be spent in taking care of physical facilities or arrangements?_____

12. With which of the two main ty es of duties listed do you need most help? Working with children_____or Care of facilities_____

13. Would the trainee ever have the sole responsibility of the group or for an individual child? Yes_____ No_____

14. If yes, for how long?
For a few minutes_____ For 30-60minutes_____
For 15-30 minutes_____ For more than an hour_____

15. What other duties or responsibilities would a worker have?
_____
_____

16. Do you have difficulty in filling vacancies with qualified persons?
Yes_____ No_____

17. Would you be willing to hire a person who has completed the gainful employment program if you had an opening? Yes_____ No_____

18. Would a worker have an opprotunity for advancement with additional training? Yes_____ No_____

19. How many hours a week is the average worker employed?_____

20. What types of training do your present employees have in the areas of child care and development?_____
_____

CHARACTERISTICS OF STUDENTS AND TRAINING PROGRAM

1. For which of the following groups do you feel this training would be most valuable based on your preference for employing?
High school students_____ Recent high school non-graduates_
Recent high school graduates_____ Adults(20-50 years)_____
Older adults (over 50 years)_____

2. Which of the following characteristics do you feel are important to consider when employing? Check and comment
Appearance_____ _____
Education_____ _____
Experience_____ _____
Marital Status_____ _____
Personality_____ _____
Training_____ _____
Love for children_____ _____
Understanding children_____ _____
Age_____ _____
Other_____ _____

3. Which of the following topics do you think would be important for classroom study or laboratory instruction in this training program?
First aid and safety_____ Principles of child development__
Foods and nutrition for children_____ Personal grooming & health_____
Work orientation_____ Planning activities_____
Preparation and use of material and equipment_____ Preschool development and organization _____
Other_____

4. Comments or other reactions:

Adapted from "A Suggested Cirriculum Guide For Preparing Child Care Workers For Entry Level Jobs", Oklahoma State University Stillwater, Oklahoma, 1968.

12. What hours could a student work in your home?

Weekdays _____ Weekends _____ On call _____

Morning _____ Afternoons _____ Evenings _____

Others _____

13. Estimate the number of hours this would entail per week? _____
per month? _____

14. How many trainees could be employed at one time?

Qualify or explain: _____

15. Would you be willing to pay the student a fair price or the "going rate" for such services? Yes_____ No_____

16. How much would you be willing to pay workers?

By the hour _____
By the day _____
By the week _____
By the month _____
Other _____

17. Would you be willing to be contacted later concerning students working in your home? Yes _____ No _____

DESIRED CHARACTERISTICS OF STUDENTS FOR TRAINING PROGRAM

18. For which of the following groups do you feel this training would be most valuable based on your preference for employing?

High school students _____
Recent high school graduates _____
Recent non-high school graduates _____
Adults (20-50 years of age) _____
Older adults (Over 50 years of age) _____

19. Which of the following characteristics do you feel are important to consider in employing some one to care for your child or children?

Appearance	_____
Education	_____
Experience	_____
Marital Status	_____
Personality	_____
Training	_____
Love for Children	_____
Understanding of Children	_____
Age	_____
_____	_____
_____	_____

20. What responsibilities or activities would you expect the student to perform while on the job?

Taking care of the child	_____
Cooking meals	_____
Straightening rooms	_____
Playing with child	_____
Dressing child	_____
Bathing child	_____
Putting child to bed	_____
Administering first aid	_____
Feeding child snacks or meals	_____
Other housekeeping tasks	_____

21. Comments or Reactions:

Adapted from " A Suggested Cirriculum Guide For Preparing Child Care Workers For Entry Level Jobs," Oklahoma State University; Stillwater, Oklahoma, 1968.

Training Agreement with Employer

Date _____

_____
(High School) (City and State)

I. The _____ will cooperate with the Home Economics Department
(training agency)
of Dekalb High School by providing work experience for a student in the gainful employment program for the purpose of gaining knowledge and experience as a _____
(Job Title)
under the direct supervision of _____.
(Supervisor)

II. The gainful employment program is designed in such a way that a minimum of 15 hours and a maximum of 40 hours per week will be spent in work experiences.

III. The student is expected to be enrolled in Dekalb High School taking _____ courses per school day in addition to the employment course.

IV. The student will receive ___ credit (s) toward graduation if he has has satisfactorily completed the employment course, which includes a related class and on-the-job work experience.

V. The rate of pay for the student shall be within a reasonable range of compensation for a beginning employee in the same job, since he is expected to fulfill the initial responsibilities of a beginner. A scale of wage progression for the trainee shall approximate those progressions available to regular employees.

VI. If the student does not fulfill his job responsibilities, the employment may be terminated by the employer after consultation with the coordinator.

VII. Termination of the training experience by the student without

approval of the coordinator shall result in the forfeiture of credit for the employment course.

VIII. Personal conduct while participating in the work experience shall be the responsibility of the student and shall comply with the rules and regulations established by the employer and Dekalb High School.

IX. While participating in the work experience, the student will retain the status of student, and it is understood that he will not displace a regular worker.

X. The student-trainee will be given a trial period on the job to show evidence of proficiency, aptitude, and acceptable attitudes toward work.

XI. The student must assume responsibility for notifying the employer and the coordinator if he is unable to work because of an illness or other emergency. He must submit a request for absence, signed by the coordinator, to the employer in advance of any required school commitments that would conflict with working hours.

XII. The student-trainee is expected to fulfill the time requirements of the job, regardless of school vacations.

XIII. The coordinator, with the assistance of the employer or someone delegated by him, shall determine objectives for training on the job.

XIV. The coordinator shall make periodic visits to the place of employment to observe student progress.

XV. Grievances of the employer or the student shall be discussed with the coordinator for consideration and adjustment.

XVI. The coordinator and the employer shall have periodic evaluation conferences related to student progress. The teacher has final

responsibility for the grade assigned the student for the work experience, since this is a part of a school course.

18.	Can you accept criticism without feeling hurt?	___	___
19.	Can you work without constant supervision?	___	___
20.	Do you ask questions about things you don't understand?	___	___
21.	Can you complete a job once you start it?	___	___
22.	Are you a pleasant person to work with?	___	___
23.	Do you like people?	___	___
24.	Are you friendly and congenial?	___	___

BOOSTING THE SCORE

How did you do? If you answered yes to most of the questions, you have the makings of a good employee. All you need now are the necessary skills and training.

If on the other hand, you answered no to more than a few of the questions, you have some work to do. These are your weak spots, the things about you that can stand improvement. You can go into your "job training" right now by changing those things about yourself and your way of doing things that will help make your career successful.

RATIONALE

Today's world of rapid technological change has enabled us to become a relatively affluent society, has eliminated much of the back-breaking work from living, and has increased leisure time. Such change adds new jobs and eliminates others in much shorter periods of time than ever expected by past generations. Those persons with little education are finding it increasingly difficult to find jobs because more and more unskilled jobs are being done by machines. On the other hand, there is also an ever mounting demand for persons with skills to operate these machines and to perform services which cannot be performed by mass production.

This new job world offers endless vital jobs for all kinds of people with varying skills and interests. Each needs to be helped to find some form of skilled work which will be of interest to her, and she needs training to help her use her leisure time to develop her creative individuality in some of the endless ways now available. This dual task brings ever new challenges to teachers.

Technological changes have greatly affected the role of the woman, freeing her from many of the time-consuming and back-breaking household chores. The attitude of society has also led to an increased number of women in the labor force. Woman is now considered an independent being who has time to pursue her interests outside the home while still being regarded as a wife and mother. The effect of new opportunities and woman's desire for psychological and social reasons for independence is indirectly seen in the following statistics.

> In 1890, of all United States women over age 10, about 17% were employed. Nineteen sixty-five figures indicated that 37.3% of all women in the United States over the age of 14 were employed...By 1965, about 33% of married women were employed.

Half of all working wives earned about one quarter of their families' total income.

The median income of women by years completed in school shows that the more years of school the higher income a woman is likely to obtain.

There is a greater likelihood that a married woman whose husband's annual income is below $7,500 will work. However, 32% of all married women whose husbands earn about $10,000 annually work.

Such figures as the above indicated that most women will be a part of the working force at some time in their lives, many for a long period of time. Programs must therefore be provided that will prepare students for new and emerging careers with some assurance they will be gainfully employed.

Anyone shopping in a department store or any type of clothing store is able to see racks and racks of garments ranging in sizes. Many persons are not able to find a pre-sized garment which is acceptable in terms of good individual fit. The problem may well become more acute when the clothing industry standardizes all sizes since individual manufacturers may no longer have particular specifications for garment sizes thus diminishing the number of sizes available.

There is a need for persons with construction skills to adapt and sew garments for those persons who cannot possibly buy well-fitting and suitable ready-to-wear. There will also continue to be those who desire to have their clothing custom-made. Thus, the need for persons who have a wide variety of skills in the seamstress-dressmaker-alterationist area is greater than ever.

Although pre-constructed items such as bedspreads, draperies and slip-covers are available to the consumer in a great variety of fabrics, colors, and price ranges, many times the customer is unable to find the exact size and design she is looking for in a price range that is within her budget. These needs help to increase the opportunities for persons with sewing skills who can make or adapt pre-constructed items to fit the individual needs of a customer.

So often home economics teachers and others have wished that fabrics salespeople knew more about fabrics and would help the customers more in their selections. With the increasing trend toward home sewing, new fabrics appearing on the market in greater numbers, and new problems occuring, the demand for well-trained fabric salespeople will continue to rise.

Every young person has to contemplate the next steps in life, and these steps will vary from individual to individual. Many times young people graduate from high school and are at a loss because they have had no specific training with which to enter the world of work. The clothing program is one which would provide at least some of these young people with the skills needed to obtain employment in a worthwhile field.

[1] Preparing for Employment in Clothing and Home Furnishings Services. A Resource Guide for Curriculum Development, Pennsylvania Department of Public Instruction, Harrisburg - 1968, p. 50.

Course Name: Pre-Vocational Clothing Construction

Grade Level: Sophomore and Junior girls

Prerequisites: Comprehensive Home Ec. I (occupational orientation survey course) and/or consent of instructor

Length of Course: One semester.

Clas Time: 55 minute period 5 days a week

COURSE DESCRIPTION

Pre-vocational Clothing Construction is a one-semester course offered to 10th and 11th grade students who may or may not have had previous home economics courses but who do possess basic sewing skills. Although it is primarily a pre-vocational course, it might also be taken by the student who merely wishes to improve present sewing skills without any intention of taking other clothing courses or in preparation for Advanced Clothing, a non-vocational course which emphasizes basic tailoring techniques.

The course consists primarily of four basic units of study: textiles, consumer buying of clothing, clothing construction techniques, and career opportunities in the areas of clothing and textiles. A rationale has been presented for each unit to show in what ways the unit applies to various occupational situations. Because this is only a one-semester course, it is not intended in any way to completely train a student for her on-th-job experience. Rather, the units of study are meant to provide a strong background in the knowledge, skills, and situations which will be needed for the various job situations students will encounter.

EXPLANATION OF PERSONAL INVENTORY SHEET

The following questionnaire is to be filled out by the students the first day of class. It is designed to serve two main purposes. First, it gives a general view of the class's abilities and experiences, providing the teacher with a basis on which to plan the course. Secondly, it gives specific information about each individual students which will help the teacher better understand problems that individuals may encounter in the course.

Because of the wide variety of experiences the students will have, questions have been constructed which will help the teacher determine how varied students' skills really are and plan accordingly where most emphasis needs to be placed. Such information also enables the teacher to know which students may need extra help and which she should be able to expect better work from. Questions such as those concerning outside work and the availability of a sewing machine should be used in determining how much outside work to expect of the students, if any.

Instead of asking students to list types of garments made, a checklist has been devised. This has the advantage of being easier to tabulate and of giving the teacher a better idea of the extent to which specific skills have been mastered, although it should be pointed out that this is far from being an accurate evaluation of student abilities. It also can be useful in assessing reasons for having certain difficulties with specific students later in the course. If a student has indicated, for example, that she can hem a garment very well, but hands in a skirt in which the hem is uneven in width or the stitches are pulled too tightly, this may indicate a need for discussing what the qualities of a well-constructed garment are.

Do you have a job after school? _____ on the weekends?_____

if so, how many hours per week do you work?_____

Circle the statement or statements which best describe your plans for the future:

1. I am planning to continue my education after high school.
2. I am planning to work shortly after graduation.
3. I am planning to be married within a year after graduation.
4. I plan to marry and continue to work.
5. I do not have definite plans for my future.

Do you have a sewing machine at home? Yes_____ No_____

Indicate below the number of years of sewing experience you have had in each of the following:

_____School _____Girl Scouts

_____Home _____Singer sewing classes

_____4-H _____Other (specify)_____

In the blank at the left, write the number which you feel most adequately describes your experience or ability in doing each of the following skills described.

1. Can do very well.
2. Have done before but needs improving.
3. Have never done.

____ 1. Laying out a pattern correctly without assistance.

____ 2. Laying out a pattern on plaid material correctly.

____ 3. Reading and following a guide sheet.

____ 4. Sewing with wool fabric.

____ 5. Using interfacing in a garment.

____ 6. Inserting set-in sleeves.

____ 7. Applying a lapped zipper in a garment.

____ 8. Making a garment with a collar.

____ 9. Lining a garment.

____10. Applying a waistband to a garment.

____11. Hemming a garment.

____12. Applying lace, braid, or rickrack to a garment.

____13. Making machine buttonholes.

____14. Making bound buttonholes.

____15. Finishing seams of garments in more than one way.

Which have been your greatest problems in sewing?

Would you be seriously interested in taking a course next year in which you would receive on-the-job training in an occupation related to clothing and textiles?

_____ Yes _____ No

If so, which of the following areas interests you most?

____ 1. Salesperson in ready-to-wear

____ 2. Salesperson in fabric dept. or store

____ 3. Alterationist (home or department store)

____ 4. Dressmaker

____ 5. Clothing repair (laundry or dry cleaners)

____ 6. Stock clerk

____ 7. Industrial sewing

____ 8. Other (list) _____

Explain below why you are interested in this occupation.

TEXTILES

- 2½ Week Unit -

3192

OVERVIEW

Anyone who plans to enter any business that deals with clothing and textiles - whether designing and making clothing, buying and selling yard goods, or ready-to-wear, or working in the alteration or clothing maintainance area - needs a knowledge of fabrics.

Designers need to know how fabrics "behave". Will the fabric fall in a soft drape or stand out stiffly? Does it hold a crease well? Can it be shaped? Is it too bulky for fathers or too soft to hold a certain line? Only by knowing the fabric's characteristics can fabric and design be matched successfully in a garment.

Those who sew, whether in production or alteration of clothing, have to know how to handle fabric successfully. Does the fabric require special care in handling? Should the stich on the machine be adjusted? Does the tension need adjustment? What kind of thread should be used? How should the fabric be pressed?

Those working in clothing maintainance must have basic fabric knowledge. Can it be washed? Will it shrink? Does it stretch easily? Does it water spot? Will certain chemicals damage it? A garment may be damaged permanently because of improper treatment.

A successful salesperson is thoroughly familiar with merchandise. Customers want information about the fabric: what is it? how will it wear? how do you care for it? are there any precautions to take in using it or cleaning it? A salesperson with fabric knowledge background knows the selling points and can make recommendations. He or she can answer the customers' questions intelligently, and give valuable information that will help the customer obtain satisfaction from her purchase. As a result, sales increase and both customer and employer are pleased.

The study of textile fibers and their characteristics is intended to help the student become familiar with the textiles on the market today. Each major fiber should be studied in detail including its origin and history, identification, properties, recommended uses, and handling and care of fabrics made from the fiber. Such basic textile information will be of value to the student not only in his work but also as a consumer since such a study will help them judge the quality of fabrics, select them wisely for specific purposes, and care for them properly.

3194

Objectives:

To know how fabrics are constructed and how their construction affects the appearance, strength, and durability of cloth.

To analyze the relationship between fabric construction and use and determine the affect this should have on garment selection for specific purposes.

Generalizations	Learning Experiences
Differences in fabrics are due to fibers, yarns, and fabric construction.	Display different kinds of fabric. List kinds of fabric with which class is familiar.
Yarns are made by twisting individual fibers.	Unravel sample of woven fabric to obtain a yarn. Untwist the yarn. Note how it separates into individual strands.
Most fabrics are made from yarns.	
The degree to which fibers are twisted affects both appearance and strength of fabrics.	Twist together a few strands of cotton batting. Twist loosely, then tightly. Note difference in strength and appearance. Experiment with breaking loosely and tightly twisted yarns.
Fabrics can be constructed by several processes including weaving, knitting, and felting.	Examine several fabric swatches to identify method of construction.
Fabric construction is a determinant of the properties of an end product; fabrics produced by different methods have definable characteristics.	Discuss different kinds of weaves. Practice "paper weaving". Discuss advantages and disadvantages as related to how fabrics might wear and uses for which they were intended.
	Compare woven, knitted, and felted fabrics. Determine advantages and disadvantages of each.
	If possible, visit textile mill to observe how cloth is produced and a knitting mill to observe commercial knitting.
	Look at variety of fabrics under microscope to see how they differ in construction. (Can also use in seeing differences in fiber structure by using various types of fibers - wool, cotton, etc.)

Objectives:

To identify the characteristics of the basic natural and synthetic fibers and be able to apply this knowledge in choosing fabrics for particular situations.

Generalizations	Learning Experiences
Each fiber has chemical and physical characteristics which affect its performance and care.	Discuss classification of fibers: 1. Natural - plant animal 2. Man-made 3. Synthetic
Knowledge of physical and chemical properties of textiles helps individuals predict their performance and gain increased satisfaction from selection, use, and care of textile products.	Discuss differences in characteristics and care procedures of natural and synthetic fibers. Show and discuss films/filmstrips. Study origin, characteristics, advantages and disadvantages, care and handling of groups to which variety of fabrics belong (cotton, linen, wool, polyester, etc.) Make chart outlining fabric properties, use, and care - attach fabric samples for classroom display. Divide class into committees to collect and present to clas samples of various types of fabrics made of the same fiber (Ex: cotton - corduroy, suedecloth, poplin, voile, etc.) Compare fabrics with similar characteristics for appearance, performance, use and expense (wool and acrylic, rayon and silk, rayon and linen, polyester and silk, etc.) Learn names of commonly used fabrics and be able to identify them (could use samples from committee findings of above project)
Certain fabrics are more appropriate for some design features than others.	Try pleating, gathering, etc. of opposite kinds of fabrics - rough and smooth, thick and thin, etc. How do these react? Would all be suitable for same garment? Display patterns involving different construction techniques and choose type of fabric most suitable for each.

3196

Blending combines the desirable characteristics of two or more fibers.	Discuss advantages of blends. Do group comparative studies with samples of blend fabrics and those of only 1 fiber. Present findings to class using charts and visual aids to show results.
	Role-play decision-making situations involving purchase of garment or other textile product basing choices on use, performance, care required, and cost. Discuss decisions made by individuals.
	Test effect of treating different fabrics to various care procedures - laundering, bleaching, ironing at various temperature settings, etc.

Objective:

To be able to distinguish the characteristics of fabric finishes in order to realize their advantages and effect on garments.

Generalizations	Learning Experiences
Finishing processes help to give the fabric special qualities it would otherwise not possess.	List finishes and trade names of finishes and state reasons for their development. Discuss advantages and disadvantages of various types of finishes (EX: permanent press leaves crease when altering garment)
The appearance and usefulness of a fabric is affected by different finishing processes.	Feel and compare fabrics with different kinds of finishes (EX: bleached and unbleached muslin, fabrics with varying amounts of sizing, etc.)
	Interpret residual shrinkage figures into number of inches a certain size of garment or length of fabric may shrink.
	Test samples of cloth for sizing, shrinking, crocking, etc. (see following page for suggested performance tests) This may be done as group projects rather than as whole class if time is limited or class is large.

SUGGESTED PERFORMANCE TESTS FOR FABRIC FINISHES

Shrinkage:

Launder fabric samples in hot soapy water. Compare the measurements of the washed sample with those of unwashed samples.

Sizing:

Examine cotton fabrics of different price ranges to determine the presence of sizing. Wash fabrics that contain sizing and compare with unwashed samples of the same fabric.

Crooking:

Rub the dry fabric against a white cloth. Repeat the test with a wet piece of the fabric. Notice whether the color rubs off on the white cloth.

Colorfastness to Perspiration:

Soak each sample in a weak acetic acid solution for 10 min. Roll it in a piece of undyed cloth and permit it to dry gradually. Check for dye on the undyed cloth.

Colorfastness to Washing:

Launder a sample of colored fabric and compare it with the original fabric that has not been laundered.

Sew a sample of colored fabric to a piece of white cloth; wash it. Check for bleeding onto the white cloth.

Immerse sample of colored fabric into water containing bleach or strong compounds similar to those used in commercial laundry. Compare with original fabric that has not been laundered.

Colorfastness to Light:

Cover half a piece of fabric with opaque paper. Expose the other half to outdoor light for two weeks. Compare the two.

Wrinkle Resistance:

Using samples of treated and untreated cloth, fold samples a number of times and fasten them with a clothes pin. Leave overnight. Unfasten and note whether or not wrinkles disappear or hang out.

Wash-and-Wear:

Compare results of drip-drying, spin-drying, and dryer-drying (tumble-drying) samples of a Wash-andWear fabric.

Stain-Resistance:

Subject samples to both oil and water stains. Determine effectiveness of finish. Determine performance of finish by washing fabrics and again subjecting them to spots and stains. Clean once more.

CONSUMER BUYING OF CLOTHING

- 2 Week Unit -

OVERVIEW

Today's teenager belongs to a segment of the population characterized by wealth. Representing approximately 12% of the total population in 1966, young people from the age of 13 through 19 were spending an estimated $18 billion. Teen-age dollars are of real importance to the nation's economy, but they are of even greater importance to the individual who is spending them. In training students to be employable upon high school graduation, it is also necessary to train them in exercising principles of wise money management in using the money they will be receiving as a result of this employment.

The American consumer faces some perplexing problems. While it is true he has more money to spend than ever before, it's also true there are more things to spend the money for. The purpose of consumer buying is to obtain goods that will be most completely satisfying for the greatest number of wants recognized as important. There are a number of problems to face in attempting to use purchasing power for this purpose, but all revolve around the basic problem of "what to buy". In solving this problem, the consumer needs to realize the importance of identifying his wants and the means by which such wants can be satisfied. He must learn to satisfy his unlimited wants with the resources available to him.

Today's buyer of clothes must have, in addition to cash or credit, certain skills and information avout the product he expects to buy. It's time-consuming to examine merchandise in many stores in order to compare values and be certain you are receiving the best value for the amount you can afford to spend. Experience helps in making wise selections, but this is something which the young shopper naturally has not had the opportunity to acquire. Lack of time and experience can be overcome somewhat if the student is trained to observe carefully, to compare similar articles and weigh their obvious values as well as to consider those that are less apparent at the moment. Such training in

3200

observation and comparison is valuable to all who need to buy. The student also needs to be made aware of factors such as best time and place at which to buy, best method of payment under various circumstances, where and how to obtain information about expected purchases, and shopping ethics. Knowledge in such areas as these is essential if we are to develop in our students better consumer practices.

3201

IMPORTANCE OF CLOTHING

Objectives:

To recognize the importance of clothing in relation to one's self-concept and family values.

To realize how values and goals affect spending habits.

To set priorities on personal needs, wants, and goals.

Generalizations	Learning Experience
Choices made when buying clothing are influenced by one's value patterns and the realative importance of his clothing goals.	Discuss wants met through clothing: protection, prestige, decency, self-expression, etc. What is first thing you notice about clothes others wear? Discuss first impressions resulting from clothing being worn. Use example of proper dress for job interviews. How do you feel when wearing clothing that you are not comfortable in? Debate: Clothing Makes the Girl.
Spending for one item may limit or eliminate the availability of money to spend on other items.	Explain how the principle of opportunity costs applies to personal planning when buying clothes. Write down 5 ways you would spend $10. Assume that if you choose 1 of these you cannot spend the money in any of the other ways. How would you make your choice? What values or goals influence it?

BUYING PROCEDURES

Objectives:

To develop the ability to make wise choices in selecting garments.

To be able to evaluate differences in quality, construction and cost.

To realize that price is not always an indication of quality.

To understand how to use limited resources to obtain maximum satisfaction in the purchase of clothing.

To develop some ability to decide when to purchase and when to make garments.

Generalizations	Learning Experiences
	Discuss qualities considered when selecting clothing: Workmanship Durability Comfort and fit Becomingness Suitability Care required Cost
	Bring to class poorly selected garment and tell why choice was not a good one.
	Discuss impulse buying.
	Debate: "One cannot afford cheap clothing."
	Discuss "When is a Bargain not a Bargain."
	Devise check sheet on criteria for judging a good bargain.
	Display purchased garments using examples of good and poor purchases. Let students evaluate. Follow by careful examination and study of construction, style, color, etc.
Comparison shopping is one way to find the best value. Price is not always an accurate indication of quality.	Have student shop for specific item of apparel in several stores comparing cost and quality. Set up evaluation sheet to use in comparing construction techniques (which can later be used for student evaluation of own projects) Report to class on findings.
	Discuss value of making own clothing - cost, fit, style, etc.
	Generalize importance of many factors in purchasing clothing: time, energy, money, creativity, knowledge, skills, etc.
	Compare cost, construction, time involvement and appearance of readyto-wear and sewn garments. Decide when to buy and when to construct garments.

WHEN AND WHERE TO BUY

Objectives:

To realize the effect that type of store and time pf purchase have on the cost, quality, and reliability of products and to apply this knowledge when shopping.

To become aware of the services offered by stores in one's locality.

Generalization	Learning Experience
The best time for shopping varies with individual situations seasonal changes, and sales.	Discuss how seasonal changes affect prices, quality and selection.
Retail outlets differ in policies, merchandize, services, and prices.	Analyze reasons for various types of sales.
Consideration of factors such as type of store and time of purchase can aid in better choice of products with resources available.	Investigate and report on advantages and disadvantages of buying from various types of stores.
Attitudes toward salespeople, merchandize and store services affect buying decisions.	Conduct local surveys or interviews to find out services various stores offer, hours stores are open and least crowded, sales and promotions scheduled by different stores, kinds and amounts of merchandise carried. Report to class on findings.
	Conduct survey on students' favorite store for purchase of specific item. Discuss reasons for each choice.

BUYING GUIDES

Objectives:

To understand sources of information available to the consumer in making choices on the market.

To recognize and use labels as guides in buying.

Generalizations	Learning Experiences
Labels often provide valuable buying, use, and care information.	Give questionnaire concerning labels to students. Discuss results. Do people let retailer know if performance of garment is unsatisfactory? Why is this a good practice?
If performance of a garment is unsatisfactory the consumer should inform the retailer.	

Collecting and studying information before buying contributes to making effective decisions.	Bring to class clothing labels from home and discuss information on labels. List characteristics of good informative label.
Brand names may imply a guarantee of satisfaction of use.	Plan method for filing labels and other tags from ready-made garments. Discuss connotations of familiar brand names in clothing. Discuss relationship to quality and performance standards of garment.
Product information is available from a number of sources including business, government, and trade associations.	Find out various sources on consumer information. Have display of pamphlets and periodicals related to consumer buying. Study and discuss local, state- and federal laws that might affect consumers.

HOW TO PAY

Objectives:

To appreciate the importance of consumer credit as a financial tool.

To become aware of the advantages and disadvantages of using various types of payments.

To become more responsible in the use of credit.

Generalizations	Learning Experiences
Awareness of the different forms of credit makes it possible for consumers to choose the one best suited to their particular needs.	Study methods pf payments: cash, check checking accounts, lay-away plans, etc. Discuss advantages and disadvantages of each in various situations.
Consumer credit permits the use of future income to satisfy present wants and needs.	What is value of establishing a good credit rating? Discuss factors which should be considered before opening a charge account.

The advantages and disadvantages of using credit are closely related to the financial resources and responsibility of the consumer.

Wisely used credit can help consumers raise their level of living.

Misuse of credit can cause financial distress to the debtor, creditor, the community, and the economy.

Knowing the cost of credit contributes to using it intelligently.

Obtain credit applications from retail store. What does form tell about your character, capacity to pay, and capital.

Set up criteria for using credit wisely. Discuss the consequences of failing to meet obligations.

Compute the cost of credit under various situations.

How can consumers decide how much credit they can safely use?

SHOPPING ETHICS

Objectives:

To develop an appreciation of the various services and conveniences offered by stores.

To realize the importance of handling merchandise carefully and assuming responsiblity for damaging of goods.

To develop responsible attitudes and use ethical practices in the return or exchange of purchases.

To act in a respectful, courteous manner with store employees.

Generalizations

Consumer and retailers both have rights and responsiblities.

Most consumers find it necessary at some time to return or exchange merchandise.

Both consumers and retailers benefit when returns and exchanges are handled properly.

Learning Experiences

Have class set up "Rules of Conduct" one should use while shopping.

Role-play situations such as returning of an unsatisfactory purchase, issuing of a complaint, etc. Note handling of problem by consumer and retailer.

Discuss fair practices in returning merchandize. Give examples of ways shoppers use privileges of buying on approval.

Consumers protect their own interests by finding out a store's policy on returns and excanges before buying.	Find out the policy on returns and exchanges in several local stores.
	Discuss the problems and expense returns and exchanges cause for the store.
Good shopping habits add to the pleasure and satisfaction gained from shopping and save time and energy.	Discuss how shopping habits can be improved. Give specific examples of how to be a courteous shopper.
	Use buzz sessions to debate whether or not stores should allow buying on approval.
Unethical and irresponsible shopping practices contribute to increases in costs of goods.	Invite resource person to discuss effect of unethical or irresponsible consumer shopping practices on cost and policies of stores.

LABELING AND CONSUMER PRACTICES

1. In purchasing a garment, do you look for a label?

   _____ Yes _____ No _____ Sometimes

2. Would you buy a garment that did not have a label or hang tag with washing instructions, type of fabric, performance of other similar information?

   _____ Yes _____ No _____ Sometimes

3. If you buy a garment with special washing instructions, do you:

   _____ Read it and throw it away?
   _____ Read it and keep it for further reference?
   _____ Throw it away without reading it?

4. If a dress shrank after washing, would you:

   _____ Return it to the store and complain?
   _____ Keep it or give it away?
   _____ Alter it?
   _____ Keep it but never buy that brand again?

5. Would you prefer information on garments to appear:

   _____ As labels sewn in garments?
   _____ On hang tags?
   _____ Have no preference

6. Assume you are deciding between two garments, both made by well-known manufacturers, similar in all respects but price. Would you buy the slightly higher-priced garment if its brand name had a higher prestige value?

   _____ Yes _____ No _____ Sometimes

CLOTHING CONSTRUCTION

- 12 Week Unit -

OVERVIEW

Learning to sew well enough to be employed in any aspect of clothing construction requires mastering of certain basic sewing skills. Speed is important, especially in mass production, but an understanding of various construction techiques amd the proficiency in performing them is also important since it determines the quality of construction of the wearing apparel that is produced.

For mass production work, the student's job will most likely consist of section work in which a stitching process is repeated over and over again. Although mainly concerned with one stitching operation, an understanding of all construction techniques helps the worker perform a job accurately and with pride, enables him to detect irregularities or mistakes in workmanship, and is essential for those interested in advancement. With superior skill and ability, one may advance to a more complicated operation, to specialized construction work - perhaps making entire garments as samples - or to supervisory work.

In custom work, one may be creating garments for specific individuals. All aspects of construction are, of course, involved here. Your success in such a job and the amount of money you earn depend very largely on the skill achieved in this area. As an alterationist it is necessary to be just as familiar with all the techniques of clothing construction as you would if clothing were made from start to finish. Alterations may sometimes involve almost remaking a garment. It is especially necessary to be expert in fitting techniques and it is just as important to know whether or not an alteration can even be made as it is to know how to make it.

In selling of fabric, an understanding of clothing construction is necessary if one is to be able to advise others. It is also regarded an advantage for fabric salespersons to wear clothes they have made. Salespeople

in ready-to-wear are better able to point out good construction techniques to customers of the merchandise they are selling. Being able to use merchandise information as selling points that will help customers reach wise decisions gives a salesperson confidence and in turn customers gain confidence in the salesperson.

People with sewing ability are also often employed by laundries and dry cleaning establishments to make repairs on articles of clothing they handle. Skill in performing a variety of basic hand and machine sewing techniques are necessary to know in such occupations.

Garments chosen for this unit should include a variety of construction techniques so the student will be prepared for the variety of on-the-job experiences he is likely to encounter. Besides the basic techniques presumably mastered in the previous comprehensive Home Ec. I course, skill in the following are emphasized:

Application of waistband
Insertion of set-in sleeves
Collar application
Lining body of dress
Ability to know and apply correct seam finish
Various hemming techniques
Various basic hand stitches
Sewing on various types of fasterners
Zipper application
Facing application

SEWING EQUIPMENT

Objectives:

To recognize and select wisely the type of sewing equipment necessary for clothing construction.

To understand and practice good safety procedures in use of sewing equipment.

To be able to identify and locate basic parts of a sewing machine and the function of these parts.

To properly thread and operate a sewing machine.

To be able to recognize possible causes of machine difficulty and know how to prevent and correct such difficulties.

Generalizations	Learning Experience
Selection, use, and care of sewing equipment influences the quality of workmanship and satisfaction derived from sewing.	Pre-test knowledge of equipment.
Proper use of equipment extends their life and efficiency.	Prepare bulletin board display of small sewing equipment.
The correct use of terms regarding equipment and parts of the sewing machine increases effective communication.	Discuss buying of thread, difference in shears and scissors, tailors chalk, etc. if necessary (indicated by pre-test)
Knowledge of parts of the machine and their function, skill in operation of it, and ability to prevent and correct machine difficulties contributes to correct performance and increased satisfaction in constructing garments.	Hand out list of necessary equipment for class.
	Review parts of sewing machine and their purpose.
	Practice threading and operating machine.
	Discuss possible difficulties with machine, their causes, how to prevent and correct them.

47 OF 327

ED

056 238

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

PATTERN SELECTION AND FABRIC PREPARATION

Objectives:

To be able to take accurate body measurements and relate these to the purchase of correct figure type and size.

To be able to identify pattern pieces and pattern markings.

To become proficient in reading the pattern envelope.

To perform necessary steps in preparing fabric for cutting.

To understand the meaning of basic terms relating to fabric such as grain-perfect, evenness of ends, and selvage.

Generalizations	Learning Experiences
Patterns are available in a variety of sizes and figure types.	Discussion of project (based on previous experience indicated in personal inventory questionnaires filled out first day of class).
Selection of pattern with regard to figure type and accurate measurements facilitates proper fit with fewer adjustments.	Using visual aids, show differences in body builds for various figure types. Discuss differences and similarities in body measurements for each size.
	Demonstrate correct way to take measurements and how to select pattern size from these measurements.
Knowledge of how to interpret information on the pattern envelope aids the consumer in making more satisfactory purchases.	Have girls work in pairs taking and recording each others measurements, choosing pattern and pattern size. Check these.
An understanding of pattern symbols is necessary for successful cutting and sewing techniques.	Discuss how to read pattern envelope for information necessary when purchasing materials for construction of a garment.
	Study pattern pieces and learn to recognize markings.
Preparation of fabric is an essential step in the construction of any garment; fabric should be grain-perfect before it is cut.	Discuss meaning of grain, selvage, etc. View filmstrip on "Grain".
	Demonstrate ways of straightening ends of material and checking grain. Discuss how methods of correcting off-grain fabrics differ and when to use each. Prepare own fabric for cutting.

PATTERN ALTERATION

Objectives:

To determine whether pattern alterations are necessary.

To be able to alter the paper pattern to fit individual measurements.

Generalizations	Learning Experiences
Properly fitted clothes enhance the appearance of the individual as well as give him an added feeling of confidence.	Discuss the importance of good fit in garments. Is there any difference in the feelings of the individual when he has a well-fitting garment and when he does not?
People need to feel comfortable in their clothes.	Compare pieces of tissue paper and pieces of fabric. In what ways do they differ? How does this apply when fitting the paper pattern?
The paper pattern pieces should be properly prepared for accurate fitting.	Demonstrate fitting pattern on the body. Show points to check. What measurements cannot be checked in this way? Why not?
One needs to be able to decide whether alterations are necessary when the pattern is placed on the body.	Demonstrate preparing the pattern for fitting (lengthening of grain-line, pressing, pinning parts together).
Altering a pattern consists of adding or taking out fullness within the pattern piece at the place where more or less fullness in needed.	See how patterns fit other students. Which ones will need alterations?
Alteration of pattern before layout reduces later fitting problems.	Use blouse shells to demonstrate fit. These could be placed on dress forms or students for which some are too large and some are too small in order to demonstrate the difference in the kind of wrinkles which occur when garments are too large and too small.
	Demonstrate making alterations for the most common figure faults. Each class member duplicate these alterations on small scale patterns and keep them for future reference.
	Record individual alterations which need to be done. Discuss with instructor how you will do these.
	Discuss remaining measurements which need to be checked and demonstrate how these are to be done by flat pattern technique.

LAYOUT, CUTTING, AND MARKING

Objectives:

To be able to interpret any pattern layout.

To know how to layout and cut a pattern accurately and with as little waste as possible.

To know basic techniques involved in laying out pattern on plaid fabrics.

To be aware of and use correct marking techniques for a variety of types of fabric.

Generalizations	Learning Experiences
The guide sheet provides information on layout of pattern pieces according to size and width of fabric.	Analyze a variety of pattern layouts. Determine type of garment being constructed, if it is placed correctly, if any changes need to be made, if there could be better use of fabric, etc.
The way in which a pattern is laid when working with plaid material determines to a large extent the beauty of the finished garment.	Demonstrate how to lay out a pattern on plaid material. Test students' knowledge of having each lay out half-size pattern on sample fabric.
Accuracy in cutting and marking is necessary in order to construct a garment which duplicates the design of the pattern.	Discuss and list general layout, making suggestions to follow: - Use sharp shears, not pinking. - Keep fabric flat on table. - Cut with long strokes of shears. - Follow cutting line carefully, never cut fold lines. - Cut notches outward. - Measure from both ends of grain line to selvage of fabric. - Overlap margins of pattern pieces. - Use enough pins to hold pattern securely but not so many that fabric bulges. - Place pins perpendicular to cutting line with point outward.
All patterns have markings which are important and should be transferred to the fabric.	Have each student layout pattern, check it before cutting.
The method of marking used is often dependent on the type of material used.	Discuss various methods of marking, advantages and disadvantages of each, type of fabric to use on, what needs to be marked, etc. Demonstrate various methods. Have students mark.

CONSTRUCTION TECHNIQUES

Objectives:

To gain an understanding of and to value the unit method of construction as an organized and efficient way of assembling a garment.

To develop and in some cases perfect skill in a number of construction techniques.

To practice and develop skills of hand sewing techniques such as hemming, attaching proper fasterners, etc.

To recognize characteristics of a well-constructed garment.

To be able to evaluate a completed garment and recognize possible improvements that could be made.

Generalizations:

The construction of a garment needs to prceed as a series of steps.

Each section of a garment should be finished as far as possible before going on with another section.

Construction should be completed in small areas and then these are joined to form larger areas.

A worker who reads and follows instructions will learn self-help methods and require less supervision.

Appearance, quality, and durability of garment construction depend on accuracy in details of workmanship.

A well-made product gives the individual a sense of satisfaction.

Learning Experiences:

Devise plan of work with students in which as many sewing operations as possible can be completed in one sitting. (See plan for skirt construction at end of unit)

Demostrate techniques as they are needed during construction. Dittoed sheets on various construction methods are handed out as techniques are demonstrated. These are to be kept in student's notebook for reference if necessary. Illustrative display materials and resource materials are provided so girls will develop habits of self-direction. Teacher is present to provide guidance and help when student cannot solve problem through other resources.

Discuss and illustrate different types of seam finishes and hemming techniques for various types of fabrics or pattern design details. Students practice techniques other than just those that apply to their particular garment.

Use list of standards formulated in unit on consumer buymanship to evaluate own garments.

Hand in garment information sheets after figuring cost, etc. Discuss problems encountered, how they were solved, how next garment should be constructed, etc.

****

Basic construction processes for first garment (wool skirt, culotte, slacks, etc.) - approximately 5-week unit:

Stay-stitching
Darts
Seams and seam finishes
Zipper application
Waistband application
Hemming
Fasteners
Pockers (optional)
Pressing

Additional construction processes for second garment (lined dress with collar, set-in sleeves, and zipper) - approx. 7-week unit:

Collar application
Set-in sleeves
Facings
Interfacings
Lining
Trims (optional)

The above garments were chosen because of the variety of construction techniques they involve. Although requirements are set up for each project so class demonstrations can correlate with the students' construction processes, the student still has flexibility in choice of pattern. The first garment involves perfecting to a high degree techniques learned through past experiences in sewing. It should be able to be completed quickly but accurately. The second garment involves techniques that fewer students would be as familiar with so that more emphasis is placed on the acquiring of new techniques.

UNIT CONSTRUCTION OF SKIRT

To construct your skirt by units, check to see if you follow the outline below. Note that if you are well organized, you need leave the sewing machine only once before doing the hand work. Organizing your sewing in such a way can save considerable time.

Skirt Back and Front - machine

_____ 1. Stay stich waistline and side seams from hip to waist of each skirt section.
_____ 2. Stitch all darts.
_____ 3. Stitch center back seam. Seam finish if it involves machine-stitching. (Can omit if it was selvage edge)
_____ 4. Measure placker opening on left side. Stitch up to this point; machine-baste placket opening shut.
_____ 5. Change to zipper foot, regular stitch.

Pressing - ironing board

_____ 6. Press darts toward center, using hem.
_____ 7. Press back and left side seams open.
_____ 8. Press 1/8 - $\frac{1}{4}$" fold in left seam allowance of side seam for zipper application.

Zipper and Waistband Applications - machine

_____ 9. Place zipper face up under folded seam allowance; stitch through zipper and seam allowance.
_____10. Turn zipper face down over opposite seam allowance; sew down right side through zipper, right seam allowance, and garment and across end. Tie knot. Rip out basting.
_____11. Place grosgrain ribbon (or interfacing) on waistband; stitch in place as directed on ditto sheet.
_____12. Fold ends of band over and stich both ends; trim; turn.
_____13. Pin band to skirt, stitch, and grade seam.

Hand Sewing - table and ironing board

_____14. Press waistband to inside; finish by hand.
_____15. Hem the skirt.
_____16. Sew on fasteners.
_____17. Give completed garment final pressing.

Note: The following is used only to show the student how her work should be organizes and how far she has progressed. By studying this as a class beforehand, each student gains a better understanding of the processes involved in the construction of her garment. It is not meant in any way to be used in instructing the student how to construct her garment.

CAREER OPPORTUNITIES IN CLOTHING AND TEXTILES

- 1½ Week Unit-

OVERVIEW

Choosing the way to earn a living is one of the most important decisions a person will make in his lifetime. The student who has had training in the area of clothing and textiles could expect to find employment in a variety of jobs. If he is to make an intelligent decision in his choice of an occupation, however, this individual needs to be made aware of the kinds of jobs available and the kind of education and training these jobs require. He also needs to make an honest appraisal of his abilities, aptitudes and interests and he should be aware of how great the competition from other people for openings is in the field he chooses for a career. In the long-range preparation for a job, students should be helped to analyze their strengths and weaknesses. This is needed so that the training program may help the person to maximize his strengths and minimize his weaknesses.

The following unit is intended to help students to know that employment opportunities they can prepare themselves for in the clothing and textiles area, to discover to some extent the types of satisfactions possible through such jobs, and to learn the kinds of characteristics which will help in getting and keeping a job. The teacher in role in this unit is also to make students aware of the importance of their skills and knowledge. Gaining confidence in some ability will in itself make a person more interested in areas in which she will be able to use these abilities. Such interests will, in turn, motivate the student to become gainfully employed in some occupation that will make her a productive member of society and to see the value of her product.

Objectives:

To realize the opportunities for employment in the clothing and textiles area.

To develop some understanding of the duries and responsibilities, working conditions, and skills involved in becoming an employee of specific occupations in the clothing and textiles area.

To develop some judgment in analyzing to what extent personal qualifications and occupational goals related to this area are compatible.

Generalizations	Learning Experiences
An increased awareness of job opportunities in a specific field can lead to serious consideration of a career in it.	Investigate all employment opportunities in your particular locality in which knowledge of clothing and textiles would be of value.
	Use resources such as Occupational Outlook Handbook, etc. to develop list of all jobs related to this field.
In deciding on a career, consideration needs to be given to educational requirements work opportunities, personal qualifications, duties and responsibilities of the job, job satisfaction and opportunities for advancement.	Select an area of clothing field in which you are particularly interested and investigate it in furthe detail. Consider businesses in the area that employ people in the field, types of positions open, of jobs available, hours, wages, working conditions.
Analysis of personal aptitudes and desires helps a person determine a suitable occupation.	Make field trips to clothing manufacturer, dry cleaning establishment, etc. if possible.
	Invite resource people to class to discuss advantages and disadvantages of job, personal qualities and skills needed, advancement possiblities. etc.
	View films, Getting a Job and How to Keep a Job. Have class discuss how personality traits help one get and keep a job.
	Redistribute last pg. of personal inventory filled out at beginning of semester. Fill out second one. Discuss changes in occupational interests and goals.

OCCUPATIONAL ORIENTATION
FOOD SERVICE COURSE OUTLINE

WORKSHOP PROJECT
HOME ECONOMICS 450
DR. LOUISE SMITH
JULY, 1970

by

Barbara Mowers Huntly High School
Lou Ann Hinton Lake Zurich High School
Marylee Frank Belvidere High School

OVERVIEW

Today's process of change adds new job opportunities and limits others. Those persons with little education find it increasingly difficult to find jobs. Thus the need for occupational training has arisen.

The purpose of this course is to prepare students for gainful employment in an occupation which uses home economics knowledge and skills in the food service area. The course content is to be used in one semester with a fifty-five minute period. The class will be composed of both boys and girls at the tenth and eleventh grade levels with a varying amount of background knowledge. The existing classrooms and equipment will be used with occasional use of the school cafeteria.

If this class were to be expanded to a one year course, the following areas could be encorporated: problems of management dealing with quality control, scheduling of employees, reduction of food waste, and profit sharing; consumer education; money and inventory management; job employability including interviewing, applications, employment agencies; and a further depth of the course content material covered.

OBJECTIVES

To provide students with opportunities to explore and to obtain information about food service occupations

To have an appreciation of status and dignity attainable in the food service field

To be able to appreciate professional compentencies and high standards of workmanship

To develop a sense of responsibility toward a job

To develop a sense of loyalty and obligation to the public and employer

To cultivate personal qualities needed for job success

To develop an attitude of respect for and knowledge of the use and care of material and equipment

To further an interest in continued training, education, and advancement

To develop an understanding and appreciation of the importance of safety, personal hygiene, and sanitation

To develop the ability to master various skills necessary to enter the field at a reasonable level

To develop the value of time and energy saving methods

To develop the ability to recognize acceptable work standards

To develop the ability to follow directions and accept suggestions or criticisms

COURSE OUTLINE

I. Orientation

To familiarize students with the food service industry
To familiarize students with the management role
To familiarize students with their role and the union's role
To familiarize students with the opportunities in food services

A. Types of establishments
B. Job opportunities
C. Management
D. Unions

II. Duties and working relations

To familiarize students with the job analysis of the specific jobs to be studied
To realize the importance of knowing and maintaining good work relationships

A. Specific duties of
   1. Waiter, waitress
   2. Busboys
   3. Counter workers, cooks, pantry and counter cooks, salad makers and bakers
   4. Chef
   5. Dish washer
   6. Store keeper
B. How to get along with fellow workers
C. How to get along with customers

III. Safety and Sanitation

To develop an awareness of the importance of personal health and cleanliness
To develop an awareness of the importance of sanitary handling practices and safety

A. Personal appearance and hygiene
B. Food borne diseases
C. Food protection and storage
D. Sanitary handling of food and equipment
E. Management practices
   1. Disposal of waste
   2. Insects and rodents
   3. Cleaning work area and equipment

F. Health laws and regulations
   1. State
   2. Local
G. Safety on the job
   1. Accident prevention
   2. First aid

IV. Basic arithmetic and cooking terms

To review the fundamentals of arithmetic for accuracy in billing customers and in preparation of food
To understand the importance of correct use of weights and measures to insure a uniform product
To learn fundamental cooking terms

A. General review of arithmetic
B. Cash register operations
C. Making out order slips
D. Use of scale
E. Use of weights and volume measurements in cooking
F. Cooking terms

V. Basic nutrition

To create an awareness in the student of the importanceof good nutrition
To recognize the four food groups and to know their relation to good health
To provide background material for the approach to cooking principles and the maximum retention to food values by proper food handling, cooking, and storage
To be able to plan attractive and practical meals

A. Good nutrition versus poor nutrition - health and appearance
B. Role of the four food groups
C. Proper handling, cooking, and storage of food
D. Planning meals to meet various situations

VI. Use and care of equipment

To be aware of the types of equipment used in quantitative cooking
To realize the importance of following directions in use and care of equipment
To learn to use the right tool for the job
To perfect skills in the use of hand tools

A. Heavy equipment
B. Light equipment
C. Hand tools
   1. Wire wisk
   2. Knives and other tools
D. Dishwasher

VII. Mechanics of meal preparation and service

To allow students to practice duties and procedures needed to prepare, serve and clean-up meals

To get a feeling of the importance of team work in a work situation

To gain knowledge of skills required

To see the value of each job in relation to the finished performance

A. Plan, prepare, and serve various meals in a series of different situations

B. Rotate jobs to gain knowledge and skills in several areas

C. Prepare and serve the following using quantity food preparation and techniques

   1. Salads
   2. Sandwiches
   3. Beverages - coffee, fountain
   4. Vegetables - sauces
   5. Garnishes
   6. Pastries - desserts
   7. Pastas
   8. Breads -quick, yeast
   9. Entrees - meat, fish, poultry

VIII. Table services and procedures

To learn the various types of services and procedures

A. Restaurants

   1. Counter
   2. Table
   3. Booth
   4. Buffet

B. Institutional

   1. Cafeteria
   2. Tray

C. Etiquette

IX. Evaluation

To be evaluated continuously
To evaluate using a variety of methods

A. Performance
   1. Attitudes
   2. Product
   3. Work habits
B. Written
C. Employability

Block Plan

Future Plans

Bibliography

Background

Evanston Township High School had had vocations programs in Distributive Education, Diversified Occupations, Cooperative Work Training (called Vocational Experience at ETHS) and Office Occupations. Until this past year these programs, particularly Vocational Experience, have taken care of home economics students.

However, this past year the director of the Vocational Experience program and I have discussed the need for a program to train for home economics related occupations. There were more students enrolling in Vocational Experience who were interest in home economics related occupations and more students than they could handle in Vocational Experience.

In the meantime the four teachers who work with the introductory 1 Home Economics classes for freshmen were discussing the needs of a special group of students about whom they were concerned. One factor that these students have in common is their enjoyment and sense of accomplishment when involved in laboratory activities in the foods lab. They need to learn by doing....understanding through discussion and reading is meaningless and boring to them. For some reading is difficult and for others it is just one of the tasks that they do not like to do but they can read. Other common factors are lack of diplomacy with both peers and adults as well as a low level of motivation.

As the teachers discussed the ways to motivate and interest these special students, the suggestion was presented to adapt a course so that is was almost entirely laboratory. These students would ordinarily enroll in 2 Homemaking which includes extensive units in Consumer Education (non lab), Home Furnishing (non lab), Clothing and Foods. And then in 3 Homemaking these students would study Marriage and Child Care (non lab), Home Management (non lab), Foods and Clothing.

The nursery school segment of the Child Development course is actually a work program based in the school. So why couldn't we adapt a work program for tenth and eleventh graders in the school? We could. Suggestions included a tea room type of setup utilizing the foods lab and living room or a boutique using clothing lab facilities to sew gift items and to do clothing alteration.

Because of the student interest in foods it was decided to explore the tearoom idea. Some of the thoughts were that charges would need to be made to cover the cost of the foods but that students could get excellent mathematical training in computing the cost of food and that consumer education would be involved in shopping decisions. If a small percentage over the cost of the food were charged, the excess might fo into a fund for field trips to local restaurants, hospitals, dormitories and other food service centers in the community. Not only would students be exposed to food service occupations but the know-how of eating in a type of restaurant other than a hamburger stand would be gained.

Students involved in the discussions seemed positive and many staff members from other departments wanted to purchase tickets for the tea room righ then. In fact the enthisiastic response of the staff helped us realize the potential we had. They suggested that students might wish to provide refreshments for after school meetings. The cafeteria manager voiced no opposition--in fact the small number that can be handled by home economics would make only a small dent in her 5,000 plus meals.

Thus, a new exploratory course, 1 Home Economics Occupations, was set up to meet the particular needs of the students previously mentioned. The attached proposal was presented to the Curriculum Committee. The Curriculum Committee was informed of future plans for cooperative vocational home economics with a staff coordinator.

The only concern of the Curriculum Committee was that it might overlap existing courses. After they were satisfied that this was not true, it was accepted if it could be handled by existing staff. 3 Homemaking is being eliminated from the course offerings in home economics so a staff was released.

At the suggestion of a counselor invitations (see attached) were sent to students enrolled in 1 Home Economics who seemed to be the kind of student the teachers were concered about. All students in 1 Home Economics were informed about this course as well as other courses in the department.

The counselors were given the following criteria for 1 Home Economics Occupations students. Students have:

completed 1 Home Economics
an interest in foods and food service
an interest in cooperative work program next school year
the characteristics of dependability and responsibility
good school attendance
good attitude toward this course even though their academic skills may be weak.

A permit from the department is possible for those to obtain who meet the above criteria except have not taken 1 Home Economics.

EVANSTON TOWNSHIP HIGH SCHOOL

Curriculum Proposal for Home Economics

I. Course Title - 1 Home Economics Occupations
(Eventually may replace 2 Homemaking)

II. Submitted by the Home Economics Department

III. Course Objectives

1. To explore opportunities in and requirements of occupations related to home economics

   To develop personal qualities which will increase employability

   To gain skills which will prepare for entering home economics or related occupations through "employment" within the school

   To purchase and use goods and services intelligently

   To grow in ability to budget time wisely and use leisure time for personal satisfaction and social usefulness

   To grow in ability to think rationally, to express thoughts clearly, and to read and listen with understanding

   To gain satisfaction from carrying out responsibilities diligently and well

2. There is no other course in the department to fulfill this need. It is to be expected that students will elect this in place of 2 Homemaking although for the school year 1970-71 the department would like to offer both courses.

IV. Need
In 1971-72 a sequel course would be offered and it would be called 2 Home Economics Occupations. This course would involve some of the students now enrolled in Vocational Experience.

This course is designed to meet the needs of students whom we are not now reaching and who are too young to work outside school.

V. A. Amount of credit - 1 unit

B. Course structure - two 2-mod, two 4-mod

C. Time - year

D. Grade level - 10 and 11 and 12

E. Prerequisite - 1 Home Economics or permit

1 Home Economics Occupations

Both the school and department objectives emphasize the need to prepare students to develop self-identification and self-direction as well as to develop occupational concepts and skills. It is toward these two major docuses that the teacher objectives of 1 Home Economics Occupations are aimed.

As Dr. Brune Bettelheim, professor of psychology and psychiatry at the University of Chicago, was quoted in the Dec. 2, 1969 issue of the Chicago Tribune, "Students should be provided with combination work and study programs so they won't have time to take part in sit-ins and demonstrations." "Kids today feel like parasites and despise the world of parents and the establishment because they continually take from their parents and society and have no way of giving." In 1 Home Economics Occupations we hope to provide a way of taking and giving.

The following plans are made with the understanding that they can and will be revised. It is possible that due to student interest and first semester experience the clothing related occupations can be explored in the second semester.

As the class meets four mods (75 minutes) twice a week (Mondays and Fridays) it will be possible to serve luncheons, buffets or other noon-time meals. The two mod (35 minutes) class meetings will be primarily demonstrations, instruction and planning (Tuesdays and Thursdays). Although there will be experiences from the beginning, meals will not be served until the class and teacher feel ready. At the outset only staff members will be invited to purchase tickets. It is the feeling that staff members will be more understanding of the initial efforts of the students and will set a standard of mannerly conduct. As the class members become more proficient and as the tone and atmosphere of the luncheons is set, students will be invited to become customers and fraternize with the faculty.

The attached chart explains the three levels of work experience available to students. The job analyses will be revised by students and teacher as they are used. All students enrolled should accomplish the entry level but all will be encouraged to proceed through all three levels.

In the following pages I am presenting preliminary plans for the course for 1970-71. The form used is identical to that of the ETHS Home Economics Curriculum Guide--generalizations, objectives, learning experiences and evaluative activities. The tentative block plan is included. As much as possible, evaluations will be on-the-job and self evaluation rather than paper-pencil tests. All of these plans are tentative and subject to change.

JOB DESCRIPTIONS AT THREE COMPETENCY LEVELS*

ENTRY

Maintains work areas by washing, sweeping, mopping or vacuuming

Washes and cares for dishes, utensils and equipment

Assists cook with food preparation

Prepares fresh produce

Assembles orders for serving

Transports food & supplies between kitchen & serving area

Maintains serving station with clean supplies

Sets tables appropriately & attractively

Removes table settings & linens from tables

Welcomes guests

Places beverage orders in kitchen

Prepares menu folder

Serves food

Sells food tickets

Balances number of tickets sold with cash received

SKILLED

Excels in table service

Plans and/or adapts menus

Prepares a variety of foods

Schedules work to produce work at predetermined times

Cooks or holds food at proper temperatures

Practices safe and sanitary methods in food preparation

Judges food quality by sight, odor, taste

Understands importance of visual appeal & appropriate combination of foods

Uses standard measurements

Understands and follows standardized recipes

ADVANCED

Keeps financial and work records

Selects and orders food, supplies and equipment

Checks and maintains food and equipment inventories

Trains other students

Supervises other students

Coordinates production and service

* adapted from "Food Service Employee", Texas Tech Univ., School of Home Economics, Dept. of Home Economics Education, Lubbock, Texas .1969.

Generalizations

1. An understanding of self contributes to understanding and accepting others.

2. Ability to recognize own feelings and control own actions contributes to personal satisfaction and acceptance by others.

3. It is easier to make and keep friends if one develops certain attitudes such as: interest in other people, friendliness, cheerfulness.

4. If responsibilities are accepted, privileges are more likely to be granted.

5. As life and society become more complex, human beings are more in need than ever of the capabilities to understand and live with minimum friction among each other.

6. Communication is a vital factor in all interpersonal relations. And it can occur in so many different ways; two major forms are verbal and non-verbal.

7. A large number of women are employed outside the home and it seems likely that this situation will continue.

8. There is a sharply dropping proportion of jobs that may be done by unskilled workers. Home economics has potential for contributin to preparation for occupations.

9. There has been an increase in service occupations, both in private households andoutside the home, and many of these service occupations have a relationship to home economics.

10. Participation in planning, preparing and serving meals can be a source of pleasure and satisfaction, and can provide an opportunity for aesthetic and creative expression.

11. Skill in food planning and preparation can be used for gainful employment.

12. Similarities in the physical structure and chemical composition of foods are the bases for their classification, handling and processing.

13. The appearance, texture, nutritive value and safety of foods may be altered by change in temperature, kind of manipulation, preseence of water, oxygen and other chemical substances.(Change in physical & chemical environment)

14. Directions for obtaining a product of given characteristics are reliable only when the nature of the original food or food mixture and the effect of the physical and chemical processes to which it will be subjected are considered.

15. Realistic management of time is based upon one's goals, values and resources.

16. The resources available for meeting consumer needs include available foods and services, purchasing power, personal information, ability, time and energy.

17. The choice of which resource to use in providing food depends on the following: quantity of each resource available
cost of alternatives
effectiveness of alternatives in producing the desired result
ability of the user to employ the resources for the purpose desired.

18. The organization of activities in providing food involves planning and coordinating of resources and demands of those to be fed.

19. Performance of routine tasks according to a plan designed for repeated use facilitates planning, preparing and serving food.

20. Selection of foods for daily diet should contribute a balance of nutrients as well as meet food budget and personal preference.

21. Safety of food is determined by the following:
natural qualities
procedures used in the production and processing
sanitary measures used in the handling and storing of food in the market and in the place of use.

22. Federal, state and local agencies work toward the protection and guidance of consumers in their purchase of certain foods by assuring the wholesomeness of these foods and their freedom from adulteration,,by establishing standards of identity, and by requiring truthful labeling and by prohibiting false statements in advertising.

Objective

To develop personal qualities which will increase employability.

Generalizations	Learning Experiences	Evaluative Activities
#1, 2, 3	Complete "Check List for Self Improvement"* in Sept.	Complete "Check List ——" in Feb & May
	Guest speakers—a personnel manager, counselor from Ill. Employment Service	Complete "Sensitivity Checkup"* & set goals for improvement
	Class prepare own rulebook for class deportment	Complete "Work Attitude Inventory"*
	Tape record an employment interview and analyze questions about personal qualities	Rate self & one another for standards of performance
	Class set up standards of performance	
	Discuss "Short Course in Human Relations"*	
	Role play giving directions to others	
	Practice verbal and non-verbal communication	

3241

Short Course in Human Relations*

The 6 most important words:

"I admit I made a mistake."

The 5 most important words:

"You did a good job."

The 4 most important words:

"What is your opinion?"

The 3 most important words:

"If you please."

The 2 most important words:

"Thank you"

The 1 most important word:

"We"

The least important word:

"I"

*adapted from Southwestern Bell Telephone Company in "Dietitian Aide", Texas Tech Univ., School of Home Econ., Lubbock, Texas. 1969

Work Attitude Inventory*

	Agree	Undecided	Disagree
1. All fathers should have a job.			
2. Work means physical labor.			
3. People enjoy work			
4. Mothers should not work outside the home.			
5. The only thing a person gets from his job is the money he makes.			
6. Teenagers should not work part time while in high school.			
7. Teenagers should not work full time while in high school.			
8. People are unemployed because they don't want to do the type of work available.			
9. People are unemployed because they don't want to work.			
10. People are unemployed because there are not enough jobs.			
11. People are unemployed because they lack educationand training to do the type of work which is available.			
12. People who sit at desks are actually not working.			

*from Illinois Teacher, Vol. IX, bonus issue, pp. 25-26.

Sensitivity*

Am I sensitive? Ask yourself these question:

1. Who can talk to me about his inner feelings of anger and be understood and respected by me?

2. Who can talk to me about his inner feelings of anger toward me and be respected by me?

3. Who can talk to me about his inner feelings of fear and be understood and respected by me?

4. Who can talk to me about his inner feelings of tenderness and be understood and respected by me?

5. Who can talk to me about his inner feelings of pride and be understood and respected by me?

6. Who can talk to me about his despair and sadness and grief and be understood and respected by me?

7. Who can talk to me about his joy and be understood and respected by me?

8. Who can talk to me about his poetic and lyrical feelings and be understood and respected by me?

Now turn these questions around and ask yourself:

1. Who can I talk to about my inner feelings of anger and be understood and respected by him?

2. Who can I talk to about my inner feelings of anger toward him and be understood and respected by him?

3. Who can I talk to about my inner feelings of fear and be understood and respected by him?

4. Who can I talk to about my inner feelings of tenderness and be understood and respected by him?

5. Who can I talk to about my inner feelings of pride and be understood and respected by him?

6. Who can I talk to about my despair and sadness and grief and be understood and respected by him?

7. Who can I talk to about my joy and be understood and respected by him?

8. Who can I talk to about my poetic and lyrical feelings and be understood and respected by hime?

*adapted from Penney's Forum, spring-summer 1970, p. 3.

Checklist for Self Improvement*

Check either yes or no.

	Yes	No
1. Do you report to class on time?		
2. Are you able to do your work without becoming bored or distracted?		
3. Can you make adjustments to changes and unexpected situations?		
4. Are you careful about your personal appearance?		
5. Do you work in a neat and orderly manner?		
6. Can you keep from becoming nervous and "falling apart" when working under pressure?		
7. Can you work without constant supervision?		
8. Are you willing to do whatever job is assigned to you?		
9. Do you have a sense of responsibility?		
10. Are you dependable? Can you be told to do a job and do it satisfactorily?		
11. Have you gained the friendship and respect of those with whom you work?		
12. Do you respect the authority of those who supervise your work?		
13. Do you pay attention to instructions and carry them out accurately?		
14. Are you willing to ask questions when you are not sure of what is expected of you?		
15. Do you accept criticism and use it in a program of self-improvement?		
16. Do you remain pleasant as you work?		
17. Are you friendly to those with whom you come in contact?		
18. Do you have an attitude of loyalty toward this course and your fellow students?		

*adapted from "Dietitian Aide", Texas Tech Univ., Schoo[redacted] Home Econ., Lubbock, T[redacted]69

Objective

To gain skills which will prepare for entering home economics or related occupations through "employment" within the school.

Generalizations	Learning Experiences	Evaluative Activities
# 13, 14, 15, 16, 17	Serves as asst. cook, waitress, kitchen helper, hostess	Uses score sheets to evaluate products
	Some serve as cook, head cook, supervisor, manager	Uses student made job description to evaluate self
	Coordinates food production and service	Prepare an audio tape of recommendations for next year's class
	Demonstrates to class proper use of selected equipment—knives, blender, mixer, etc.	
	Prepares a variety of foods—main dish, salads, vegetables, desserts, appetizers, breads, beverages, etc.	
	Prepares menu folder	
	Plans and/or adapts menu	
	Uses substitutes in recipes	
	Demonstrates creating an attractive centerpiece	
	Guest speaker from health dept on food and sanitation	
	Guest speaker on quantity foods	
	Field trip to observe commerdal food service	
	Prepares job descriptions	

Objective

To gain satisfaction from carrying out responsibilities diligently and well.

Generalizations	Learning Experiences	Evaluative Activities
# 4, 10	Students take turns reading aloud thank you notes received from guests	Give a special award or pin to students who carry out a responsibility unusually well.
	Lists his/her contributions to the guest meals	
	Each student photograph a table setting, centerpiece or a guest meal that he/she would like to keep	Keep scrap book of thank you notes, pictures, menus, etc.
	List non-financial rewards from home economics related occupations	
	Go to lunch at a restaurant on proceeds of class meals	

Objective

To grow in ability to budget time wisely and use leisure time for personal satisfaction and social usefulness.

Generalizations	Learning Experiences	Evaluative Activities
# 15, 16, 17, 18, 19	Schedules work to produce a specific food at a predetermined time	Evaluates guest meals for timing
	Schedules work to produce an entire meal at a predetermined time	Completes a time plan for a given situation
	Experiments with short cut methods of food prep	Prepare "My Goals, Values and Standards" after class discussion
	Interview an acquaintance with many responsibilities how does he or she manage?	
	Completes a work record for oneself	
	Prepare a school time plan for oneself	Evaluate plan on basis of workability
	Prepare a weekend time plan for oneself	" " "
	Discuss time as related to energy, ability, products available, services available, and one's values and goals	
	Compare process of time planning in class with planning one's own time	
	Collect helpful short cuts from newspapers, magazines--post and discuss	
	Define goals, values, standards, time as a resource, energy as a resource, ability as a resource, available goods & services, purchasing power	
	Complete time and motion studies on selected routine tasks	
	Work with music	Evaluate effect of working with music

Objective

To grow in ability to think rationally, to express thoughts clearly, and to read and to listen with understanding.

Generalizations	Learning Experiences	Evaluative Activities
# 3, 5, 6	Welcomes guests	Balance food tickets & money
	Takes orders for beverages	Analyze tape recording of guest conversation for ability to express thoughts clearly
	Sells food tickets	
	Follows directions of teacher or supervisor	
	Follows standardized recipes	
	Increases or decreases recipes	
	Works with and, in some cases trains & supervies, other students	
	Guest speakers--business teacher on keeping accounts, reading teacher on reading directions, speech teacher on making oneself understood	
	Field trip--order own luncheon, observe waiter or waitress	
	Tape record conversation with a guest	
	Plan a meal together as a class and analyze thought processes	
	Keeps accounts	
	Keeps own work records	

3243

Objective

To purchase and use goods and services intelligently.

Generalizations	Learning Experiences	Evaluative Activities
# 18, 19,20, 21	Selects and orders food	Evaluate quality & effective usefulness of present equipment
22	Selects and orders supplies	
	Selects and orders equipment	Make recommendations for equipment to buy next year
	Checks and maintains food and equipment inventories	
	Field trip—guided tour of grocery store	
	Guest speaker--representative of local consumer fraud office re food products	
	Cares for dishes, utensils and equipment	
	Cares for food supplies	

0250

Objective

To explore opportunities in and requirements of occupations related to home economics.

Generalizations	Learning Experiences	Evaluative Activities
# 7, 8, 9, 12	Panel of women workers on "Why I Work"	Complete "Outline for Studying Occupations"* after field trips
	Guest speaker--asst. director of ETHS cafeteria who started as a line worker	Prepare a bulletin board on home ec related occupations
	Field trips--hospital food service, restaurant, homes for senior citizens, Northwestern dorm, Jewel food or other store with home economist, Sara Lee Bakeries, etc.	Present a program on home ec realted occupations to freshman classes
	Do a community study of mothers who work--how many work full time? part time? in home ec related occupations?	
	Keep a scrapbook of newspaper, magazine articles about home ec related occupations with name of contributor recorded	
	List home ec related occupations using USOE Occupations Handbook	

32251

Outline for Studying an Occupation*

Conditions within the occupation

What are the duties one performs in the occupation?
What are the divisions or separate fields in the occupation?
What is the job in which one usually begins?
What are the steps through which one advances to higher positions?
What are the hours of work?
Is the work seasonal? If so, which are the busy months? Which the slack months?
Are there any particularly unhealthful features about the work?
Are there any unethical features?
How many persons are engaged in the work?
Is the occupation overcrowded?
Is it likely to grow?
Is it unionized?
What is the best way to get a job in this field?

Requirements of the occupation

How old must one be in order to enter the occupation?
Are there any special requirements as to height, weight, strength, etc.?
Are any of the special senses particularly involved?
What personal traits are most often mentioned in connection with the occupation?
Is the activity involved chiefly mental or physical?
Does it require more than average intelligence?
Is it predominantly social--that is, does it require one to deal largely with people?
How much general education is necessary?
What kind of special training is needed?
How long a time is required for special training?
Where can special training be obtained? How much in educational institutions?
How much on the job?
How much will preparation cost?

Rewards obtainable

On what basis is a worker paid in this occupation--by the hour, piece, day, week or month?
How much can one earn by overtime work?
Is a bonus paid?
How much is the average pay--on a beginner's job and at later stages of advancement?
How much might one expect to earn after ten years of service in the occupation?
Are there provisions for sick benefits, profit sharing, pension, workmen's compensation?
How much vacation is given with pay?
What are the chief rewards of a nonfinancial nature?

*Illinois Teacher, Vol. VIII, No. 3, pp. 136-7

1 Home Economics Occupations
Tentative Block Plan

	Objective	Monday (4 mods)	Tuesday (2 mods)	Thursday (2 mods)	Friday (4 mods)
ept. 7	Orientation	Labor Day	Institute Day	Orientation Describe Class Get Acquainted	Practice Lab
14	Orientation Skills	Plan Simple Meal to Serve Ourselves	Orientation - Prepare Class Rulebook	Set up Evaluation for Tomorrow's Meal	Prepare and Evalua Meal
21	Skills	Practice Lab Concentrate on Skills	Divide into Groups to prepare job Descriptions	Finish job descriptions - How evaluate?	Prepare same meal as last Friday with improvements
28	Personal qualities time management	Evaluate Friday's lab using job descriptions	Techniques - measurements and terms	Personal qualities "Customer Needs"	Plan 1st and 2nd guest meals
)ct. 5	Skills Table Service Time management	Practice guest meal	Evaluate meal emphasis on food quality & timing	Table Service	1st guest meal
12	Skills Time mgmt	Columbus Day	Practice 2nd guest meal	Practice 2nd guest meal	2nd guest meal
19	Consumer Skills	Plan guest meal	Table Service	Ordering Food	3rd guest meal
26	Consumer skills	Plan meals by dividing into 2 teams	Discuss purchasing food	Caring for supplies	Guest meal team 1 (Team 2 - planning
. 2	Home Ec. Related Occupations Skills	Field trip to Home Ec. related occupation	Discuss field trip	Complete outline for studying occupations	Guest meal team 2 (Team 1 - planning
9	Thinking skills	Practice lab on on needed skills	Discuss thought processes in planning	Demonstrate new skill	Guest meal team 1 (Team 2 - planning

	Objectives	Monday (4 mods)	Tuesday (2 mods)	Thursday (2 mods)	Friday (4 mods)
ov. 16	Expressing self Time management skills	Experiment with short cuts	Define and discuss values, time as resource, etc.	Class interview acquaintances with many resp.	Guest meal
23	Satisfactions expressing self	Field trip - go to lunch at restaurant	Guest speaker - reading teacher	Thanksgiving	
30	Reading skills	Institute Day	Guest speaker - reading teacher	Demonstrate center-pieces	Guest meal
Dec. 7	Skills	Practice vegetable cookery	Discuss vegetable cookery	Discuss protein cookery	Guest meal
14	Sanitation skills	Practice protein cookery	Safe and sanitary practices	Guest speaker - Evanston Health Dept.	Guest meal
Jan. 4	Consumer time mgmt. skills	Field trip to grocery	Purchase and use of food	Plan foods to make ahead	Guest meal
11	Skills satisfactions Personal qualities	"Make ahead and freeze" lab	Personal qualities Verbal & Nonverbal comm.	Satisfactions - scrap book (Student awards thank you's, etc.)	Institute Day
18	Home Ec. related group skills	Practice yeast bread	Home Ec. related occup. guest speaker from ETHS cafeteria	Home Ec. related occup. panel of women workers	Guest meal
25	Home Ec. related occupations	Field trip to related occupations	Exams	Exams	Exams
b.	Time management	President's Day	Grading Day	Discuss time mgmt. as related to other resources	Guest meal

	Objectives	Monday (4 mods)	Tuesday (2 mods)	Thursday (2 mods)	Friday (4 mods
eb. 8	Thinking Time mgmt. skills	Plan meals ahead	Guest speaker Business teacher on acct. keeping	Class work on accounts	Guest meal
15	Consumer skills	"Make ahead and freeze lab"	Inventory food supplies	Prepare food orders	Guest meal
22	Expressing personal quality skills	Practice lab desserts	Role play - giving directions to others	Check list for self improvement - 2nd check	Guest meal
ar. 1	Satisfactions skills	Field trip to restaurant	Revise job descriptions	Plan for special guest meal	Guest meal
8	Consumer skills	Special guest meal - counselors	Evaluate special guest meal	Purchase and use of equipment	Guest meal
15	Consumer skills	Practice lab beverages	Purchase and use of food	Plan for 2nd special guest meal	Guest meal
22	Sanitation skills	Special guest meal - advisory council	Demonstrate safe handling of foods	Demonstrate sanitary methods	Guest meal
29	Personal qual. skills	Practice lab salads	Discuss short course in human relations	Guest speaker - Ill. Employment Service	Guest meal
Apr[illegible]	Home Ec related occup.	Field trip to H.E. related occup.	Work on outline for H.E. related occup.	Work on outline for H.E. related occup.	~~Good Friday~~
19	Consumer time mgmt. skills	Plan ahead for special meals	Do grocery orders ahead	Store food	Guest meal

	Objectives	Monday (4 mods)	Tuesday (2 mods)	Thursday (2 mods)	Friday (4 mods)
Apr. 26	Time management skills	Make ahead and freeze lab	Prepare a personal time plan for Wednesday	Evaluate Wednesday's time plan	Guest meal
May 3	Skills	Special guest meal for administration	Guest speaker - Centerpieces	Prepare a tape of recommendations for 1971-72 class	Guest meal
10	Consumer skills	Practice lab	Guest speaker on consumer fraud	Work on scrapbook	Guest meal
17	Consumer skills	Special guesl meal	Evaluate class rulebook	Decide on equipment to buy 1971-72	Guest meal
24	Home Ec. related occupations	Field trip to related occupations	Checklist for self improvement - final rating	Satisfactions - giving awards	Final meal!
31	Home Ec. related occupations	Memorial Day	Complete outlines of Home Ec. related occupations	End of year finishing up	Exams
June 7		Exams	Exams	Exams	Institute Day Faculty Breakfast

FUTURE PLANS

In the school year 1971-72 it is expected that there will be enough enrollment (and money) to employ a coordinator to carry on the cooperative vocational Home Economics Related Occupations (HERO) program. Students would be eligible for HERO by taking home economics courses. For example, the seniors who have enrolled in Child Development as juniors would be eligible to be placed in community nursery schools. A continuation of the Child Development course observation-participation in elementary schools might be developed into a teacher aide program in the elementary schools. Other courses that could provide possible occupational background are Clothing and Advanced Clothing. There is need for alteration and dress making services in our area. Students who have had Home Planning and Furnishing might be interested in employment in furniture or interior decorating establishments. The semester Foods course would provide some occupational background if the student had not enrolled in 1 Home Economics Occupations.

During the school year 1970-71 a Home Economics Advisory Council will be selected. It will have as members student, parent and business representatives. The business representatives will be a part of the home ec council but will meet separately to make plans and decisions regarding the cooperative program. A business member of the Home Economics Advisory Council will be a member of the advisory council for all the cooperative programs in the school.

Every opportunity to explain Home Economics Related Occupations (HERO) to students, parents, faculty and prospective employers will be taken. As the time comes to set up schedules for courses in 1971-72, it will be important to investigate the possiblity of arranging class to meet at the same time as Vocational Experience so team teaching will be possible.

The coordinator will be employed in July to make contacts with students, and their parents and to prepare an employer survey. The local branch of the Illinois Employment Service is a logical beginning for surveying community work needs. Cooperations with the other coordinators in the school is imperative to prevent duplication of job stations and hard feelings.

Other summer responsibilities for the coordinator include:

- interview with student and prospective employer
- job analysis with student, employer and coordinator together
- an agreement to provide training and experiences agreed upon that is signed by the student
- an agreement to fulfill the responsibilities agreed upon that is signed by the student
- an agreement to provide the instruction agreed upon that is is signed by the coordinator
- evaluative procedures - how student is to be rated by employer, how often the coordinator visits, how frequently three way evaluative conferences will be held, etc.

Although instructional materials are already being collected, there needs to be constant attention to this phase of the program next year.

Plans for the youth organization are part of the focus for 1970-71. It seems to be sensible to meet during class periods and have a special HERO club at ETHS. Student responsibility for the club will ad the development of initiative, reliability and dependability.

WORK ORIENTATION SURVEY UNIT
RELATED TO
HOUSING, HOME FURNISHINGS, EQUIPMENT

Workshop

Vocational Programs In Home Economics

Home Economics 450

Nancy W. Davis

OVERVIEW

This work orientation survey unit is designed to be taught in coordination with a one semester curriculum entitled Housing and Home Furnishings. The curriculum will be open to both boys and girls who are in their Junior or Senior year in high school. The curriculum will be taught by the Home Economics Department but is listed in the school course catalog under the areas of Home Economics, Art and the Industrial Arts Departments. Therefore, students with a vast range of learning experiences will be enrolled in the course with a strong common interest in the area of Housing and Home Furnishings.

The general behavorial objectives of the unit were predetermined as a part of Palatine Community School District #211 Plan for Vocational and Technical Education.when the school's plans were written for the States consideration for vocational reinbursement. In keeping with the behavorial objectives, a concept was formulated to provide a basic structure for the learning process. The generalizations , as stated in the unit, are what the instructor expects to be part of the immediate behavorial outcomes and will also be used in the future as a bases for serious consideration concerning occupational goals. Specific behavorial objectives were then created to lead to definite measurable learning experiences.

The underlying rationale of the unit is based on developmental characteristics of the late adolescent. They are " more attention given to ways of earning a living"(1), "Eagerness to become self sufficient and self supporting"(1) and "Selecting and preparing for a occupation"(2). It is important for students to explore many career possibilities before he begins to narrow down the choices that could lead to a successful occupational befitting his interests. Since the curriculum

being studied covers the area of Housing and Interior Design, the work orientation survey will focus in on many of the varied yet related skilled and professional occupations. It is possible to explore these occupations by various methods such as a survey method, a research study, reading on occupational information, personal observations and individual interviews. The unit was designed to contain all of the above learning experiences.in the exploration of the possible occupations.

It is the goal of this work orientation survey to not only increase the occupational awareness of the students but to develop a program in tune with the needs of the community so that the student can achieve civic competence and the community can benefit to the greatest extent possible.

(2) Havighurst, R. J., Developmental Tasks and Education, New York: Longmans Green and Co., 1952.

Concept

The fields of housing and interior design have a wide range of possible occupations to meet the personal satisfactions of both the skilled and professional person.

Generalizations

The need for a work orientation interest survey is important in aiding a student to begin to evaluate his future occupational goals.

A relationship exists between a high school curriculum and occupational goals in the wise use of learning experiences.

An individuals choice of occupation ultimately determines his education, his skills, social and economic level.

An individuals future is identified in part by his choice of an occupation.

To succeed in any occupation a person must havesatisfaction from his labors and beable to work with others.

Broad General Behavorial Objectives

To identify the occupations and future trends in housing, home furnishings and equipment.

To gain knowledge and appreciation of services available in the fields of housing, home furnishings and equipment.

To cultivate personal qualities needed for job success.

General Behavorial Objective

To identify the occupations and future trends in housing, home furnishings and equipment.

Specific Behavorial Objectives

To list occupations and trends in the area of housing and home furnishings and equipment by conducting a survey of related occupations in the local area.

To research, in groups of 2-4, related occupations in the area of housing, home furnishings and equipment that were identified by the class survey.

Learning Experiences

Class discussion on possible related occupations. Use The Dictonary of Occupational Titles and the Illinois State publication, Descriptions, Definitions and Occupational Coding System. Speaker-Guidence Counselor

Students survey the local area through the use of the occupational survey form.

Students compile the results of the occupational survey; select a occupation that they are interested in to research in small groups with other students. Occupations not selected to be research can be studied through the use of related films, field trips or guest speakers.

Resources

School Guidence Counselor
District 211 Vocational Education Coordinator
Illinois Employment Service
Career Center- School Library
Telephone Directory
Paddock Publications Directory
Local Resource People

Evaluation

Occupational Reasearch Project

General Behavorial Objective

To gain knowledge and appreciation of services available in the fields of housing, home furnishings and equipment.

Specific Behavorial Objectives

To analyze occupational information gained through research by presenting a project on the related occupations to the class.

To list occupations that relate to knowledge gained from the Satisfaction Questionnaire and the study of the occupational projects.

Learning Experiences

Students divide in small groups to select and research a related occupation. Upon completion of the project, the groups will give a written copy to the instructor and then present the project to the class. Presentations may be in the form of a panel or a visual presentation with oral explanation.

Students diagram or make a chart of occupations showing the relationships between the the knowledge gained from the research projects and the understanding gained on the Satisfaction Questionnaire. This will show occupations that will lead to success for that student.

Resources

Job Analysis Project Sheet
Career Center-School Library
State Employment Service Office
Local Resource People
School Guidence Counselor
Information gained on occupational survey

Evaluation

Research Project

Student occupational satisfaction diagram

General Behavorial Objectives

To cultivate personal qualities needed for job sucess.

Specific Behavorial Objectives

To identify personal needs to be served by an occupation the student will complete a Occupational Satisfaction Questionnaire.

To practice personal interrelationships by participating in an Occupational Research Project.

To write a self-evaluation of participation in group dymanics while working on the research project.

Learning Experiences

Students will answer Satisfaction Questionnaire and study the results.

Assign readings on group dymanics and self-understanding. Class discussion on readings. Groups then elect project leader and assign tasks necessary to complete porject.

Students interview a community resourse person related to their project.

Upon completion of research project, each student write a reaction paper to his participation in t he project.

Resources

"Your Attidudes are Showing"
"Everyday Human Relations"

SRA Series on Personal Development

Evaluation
Group dymanics through project reaearch and presentation.
Written reaction paper of group dymanics during reseerch project.

Student Occupational Survey
Housing and Interior Design
Vocational Education Program
_____ High School
_____, Illinois

Name of Firm or Individual _____

Address _____

Purpose

The purpose of this survey is to determine what occupational needs exist in the fields of Housing and Interior Design. The field of "Housing" encompasses those occupations that deal with home building, design or sales. The field of "Interior Design" would include occupations involving the interior functioning of a home.

Housing

Do you or does your firm employ persons in the following occupations. (Please note number of persons in spaces provided.)

_____ Architect
_____ Carpenter
_____ Blue Print Technician
_____ Plumber
_____ Drywall Specialist
_____ Appliance Repairman
_____ Real Estate Agent
_____ Property Appraiser

_____ Electrician
_____ Carpet/Tile Installer
_____ Bricklayers/Masons
_____ Roofers
_____ Painter/Wall Paperer
_____ Other: _____
_____
_____

Interior Design

Do you or does your firm employ persons in the following occupations? (Please note number of persons in spaces provided.)

_____ Interior Designer
_____ Interior Decorator
_____ Color Consultant
_____ Remodeling Consultant
_____ Other Design _____
_____

_____ Home Furnishings Consultant
_____ Home Furnishings Sales: (Note Below)

___ Carpet Sales
___ Paint/Wallpaper Sales
___ Drapery Sales
___ Appliance Sales
___ Other Furnishings Sales

Future Trends

Do you foresee new occupations or specializations influencing your needs in the near future? _____ If "Yes", give general description(s).

_____

_____

_____

_____

Availability

Would you or other members of your firm:

_____ Be available to speak in person to school class.
_____ Be available for interview by a student.
_____ Be able to provide pamphlets or brochures on occupations in housing or interior design.
_____ Be available to discuss development and expansion of housing and design programs in local schools.

Comment and Critique

Do you have any additional comments or ideas to express? _____

_____

_____

Thank you very much for your time. It is our desire to develop programs in your schools in tune with the specific needs of the community. The information you have provided will be included in our program planning.

_____
(Identification)

Housing, Home Furnishing and Equipment

Job Analysis

Project

Group research and presentation on a related occupation to the semester course of study. Base inquiry on the following points. Present in completed form to instructor and then present to class by either a panel discussion method or by a visual presentation with some oral explanation.

1. List job title - DOT Title or DOT Code Number. Give a description of occupation.

2. History, development, and probable future trends of the occupation.

3. Duties of worker. Daily or periodic tasks performed by a person in this occupation. What have you found to be included in a typical day's work?

4. Requirements of the worker for entering and succeeding in the occupation. Education and special training necessary. Where secured. Entrance requirements of those schools. High school courses that are essentials for that occupation. School courses that are recommended as desirables. School courses that are recommended as preparation for a college course that offers training for this occupation. Union organization and requirements. Licenses required. Examinations required. Civil Service requirements.

5. Qualifications of the worker. Personal qualities desirable (such as age or sex), personality traits, physical qualifications necessary. Hobbies that are especially relevant to this occupation.

6. Economic demand. Number of workers in this occupation according to the United States Census report and Occupational Outlook. Yearly turnover of workers in this industry. Why? Number of male workers in this occupation. Of women. Number of workers ten years ago. Is this occupation growing in importance? Is the field crowded? Is the work seasonal? Is work in this field necessary in times of depression, of war? Is work geographically limited? Average salary of men and of women? Average salary of beginning workers, of experienced workers?

7. Conditions of work. Hours. Health and accident hazards. Regularity of employment. Effect of this work on the lives of the workers.

8. Opportunities for placement. For experience. For apprenticeship. For advancement. Related occupations to which one might seek promotion. Opportunities for social or mentary rewards. Opportunities for profit sharing, bonuses, annuity or retirement insurance, sick benefits, vacations, discounts on goods purchased from the employer. Opportunities for home life, recreation, cultural growth, and participation in community affairs. What service useful to society does the worker perform?

9. Advantages of the occupation. What workers in this occupation like best about it.

10. Disadvantages and special problems. What workers in this occupation like least about it.

11. Report of a personal interview with a worker in this occupation.

12. Related newspaper clippings or magazine articles, pamphlets, and pictures.

SOME SUGGESTIONS FOR ESTABLISHING A COOPERATIVE GAINFUL EMPLOYMENT PROGRAM IN THE AREA OF HOME FURNISHINGS

by

Jane Prokop
Marengo Community High School
Marengo, Illinois

Vocational Home Economics Workshop
Home Economics #450
Dr. Smith

Nothern Illinois University
Summer, 1970

Suggestion for Developing a Vocational Education Program
in the area of Home Furnishings

I. Set up an Advisory Committee:
- A Home Economist
- An Interior Decorator
- Department Store Manager
- Drapery Shop Owner
- Furniture Uphosterer
- County Extension Agent
- Antique Shop Owner
- Slip Cover Seamstress
- Green House Owner

II. Secure Information on opportunities for employment:
- A. Analyze material collected by:
  - State Employment Service
  - Bureau of Census
  - Chamber of Commerce
  - Others
- B. Secure additional information if needed through occupational survey.

III. Determine number of potential students and their interest:
(through the use of a student survey)

IV. Define or describe Job Analysis:

V. Develop a Syllabus:
- Objectives
- Concepts
- Generalizations
- Learning Experiences
- Teaching Aids
- References

V. Determine what facilities and equipment are needed

VI. Evaluation of the Program

Cover Letter for a Community Survey

Dear Mr. Employer:

We are conducting a survey to determine a need for a gainful employment program in the area of Home Furnishings Services. We are investigating the present supply and the future demand for trained workers in this area.

An advisory committee and myself will summarize the answers from the questionaires so that we will have some basis for developing our Vocational Home Economics Program.

Your answers to the questions do not obligate you in any way at anytime.

We have enclosed a self-addressed, stamped envelope and ask that you return it to us by _____ .
(date)

Thank you very much for your co-operation in participating in the survey.

Sincerely yours,

SURVEY QUESTIONAIRE

(Survey of managers and owners of drapery and upholstery workrooms, interior design studios, department stores, furniture stores, antique shops, green houses and slip cover seamstresses.)

Name of Establishment _____

Address _____

Phone _____-

Number of employees: full time:_____
part time_____

1. Age requirements for trainees: Males_____
Females_____

2. Are you interested sufficiently in a co-operative work program to employ a student worker in your establishment?
Yes _____ No _____ Maybe _____

3. If you were interviewing persons of about equal personal qualities, would you prefer to hire the one who had high school Home Furnishings training? yes_____ No_____
Comments_____

4. What types of situations could you use a Home Furnishings Aide?

5. What personal characteristics would you expect in a worker?

appearance

dependability

grooming

follows instructions

attitudes

6. What type of equipment do you expect employees to operate?

7. Check which of the following tasks or responsibilities you would expect the trainee to do:

_____ familiarize self with policies and procedures of business operations.

_____ accepts instruction and guidance from employer.

_____ performs clerical duties of any kind.

_____ organizes and files sample catalogs.

_____ marks new merchandise.

_____ assists in taking inventory

_____ assists in arranging window or store displays

_____ assists in planning and arranging of furniture in the store

_____ assists in wall paper department by arranging samples, fabrics or catalogs

_____ keeps drapery and upholstery samples in order.

_____ measure, cuts and mails fabrics

_____ assists interior decorator

_____ sews draperies - if so, what parts

_____ installs draperies

_____ assists in repairing or altering draperies, curtains, shades or blinds

_____ Constructs the following:

- ___ bedspreads
- ___ lamp shades
- ___ window shades
- ___ pillows
- ___ slip covers
- ___ reupholster furniture
- ___ flower arrangements
- ___ Others

_____ assists in upholstery furniture remodeling

_____ assists in maintence of work area

_____ assists in refinishing furniture

_____ conducts sales work

SURVEY OF STUDENT'S INTEREST

Home Furnishings:

Please rate the following units that you might be covering in a Home Furnishings course.

1. would like to study in detail and perhaps gain work experience
2. would like to study for general knowledge
3. would not like to study

_____ Drapery Construction

_____ Curtain Construction

_____ Shades and blinds

_____ Principles of Color and Design

_____ Arrangement of Furniture

_____ Period Furniture

_____ Preparing Window and Store Displays

_____ Furniture Construction

_____ Refinishing Furniture

_____ Slip Cover Construction

_____ Bedspread - Table Coverings Construction

_____ Merchandising

_____ Functional and Decorative Lighting

_____ Floor Coverings

_____ Flower Arrangement

_____ Others

Comments:

Home Furnishings Aide

09.0204 (Office of Ed. Titles)

The occupation of Home Furnishings Aide is one suggested for the student who is interested and possesses the ability in interior designing. The skilled student must appear to be imaginative and understand tasks involved in being employed in the various Home Furnishing occupations.

Homaking Occupations I is a prerequisite for the Home Furnishings unit. It is suggested that the student have some degree of skill in sewing since the job might involve sewing.

A student employed by an Interior Designer or in the Home Furnishings department of a store will need an understanding of Art and Design principles as well as sales procedures and arranging displays. Other duties might be keeping files and samples.

The Home Furnishings Aide in a drapery, upholstery or slipcover workroom would assist in the construction process. The student must have a thorough understanding of drapery construction, highly developed skills of sewing and the imaginative ability to design different window treatments and slip covers.

The student employed in a green house will need a knowledge of different plants and flowers and an understanding of art and design principles related to flower arranging.

The student employed in a furniture store might need to understand principles of furniture arrangement, period furniture, lighting principles and knowledge of floor coverings. Here the student's salesmanship qualities are important to consider.

BROAD COURSE OBJECTIVES

A. To recognize opportunities afforded in the Home Furnishings field.

B. To evaluate and appreciate the personal characteristics that contribute to success of the wage earner.

C. To understand the principles of interior design needed by workers in the Home Furnishings related occupations.

D. To develop abilities and skills needed for employment in the Home Furnishings related occupations.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

SPECIFIC OBJECTIVES

After a person has completed this class he/she will be better able to:

1. Recognize the characteristics of careers in Home Furnishings.
2. Identify and develop desirable personal attributes for employment.
3. To gain an understanding and development of some knowledges and skills necessary for selecting and keeping a job.
4. To interpret and perform the fundamental principles, practices and skills of Home Furnishings services for those who preceive it as a possible terminal vocation after high school.
5. Apply principles of art and design.
6. Develop acceptable work habits and co-operative relationships with employers, employees and customers.
7. To apply principles of design in arranging furniture displays.
8. To apply principles of art and design in the construction of a) slip covers b) bedspreads c) shades d)curtains e) draperies and f) flower arrangements.
9. Apply principles of functional and decorative lighting.
10. Plan and perform effective management practices in the use of time, energy and money.
11. Identify and perform safe practices while on the job.
12. Identify and perform sanitary practices while on the job.
13. Use the basic equipment in the particular related areas of Home Furnishings.
14. Use of correct terminology in the area of Home Furnishings.
15. Recognize various period furniture and be able to use this knowledge in the sales, arrangement and construction of furniture and related materials.

HOME FURNISHINGS

MAJOR CONCEPT: Selecting and Keeping a Job

I. Minor Concept: Being aware of occupations related to the Home Furnishings area.

A. Kinds of jobs available
1. drapery workroom
2. slip cover workroom
3. furniture store
4. interior design studio
5. green houses
6. antique shop

B. Scope of job
1. local
2. national
3. international

C. Advancement opportunities
1. apprentice program
2. rate of advancement
3. setting goals

II. Minor Concept: Recognizes and adapts important traits for being employable

A. Personal traits
1. health
a. government standards
b. employers standards
c. personal standards

B. 2. grooming and good manners
a. health practices
b. public relations
c. personal satisfaction

MAJOR CONCEPT: Understanding the use of color and design
III. Minor concept: Understanding the use of design elements

A. Design is the organization of basic elements
1. knowledge promoting good taste
a. recognizing
b. selecting
c. creating

2. form

3. shape

4. texture

5. color

6. space

7. line

II. Minor concept: Understanding classifications of design

A. structural design

B. decorative design

III. Minor concept: Studying Principles of design

A. Definitions
B. Types
   1. functional
   2. decorative

C. Principles
   1. proportion
   2. balance
      a. symetrical
      b. asymetrical
      c. radial
   3. Rhythm
      a. repetititon
      b. gradiation
      c. opposition
      d. transition
      e. radiation
   4. emphasis
      a. what to use
      b. where to use it
   5. unity (harmony)

IV. Minor concept: Learning about color

A. Practical choice
   1. psychologically
   2. artistically

B. Reflection - Absorbtion

C. Emotional appeal

D. Qualities of color
   1. value
   2. intensity
   3. hue
      a. shades
      b. tints

V. Minor Concept: Using color successfully

A. color wheel
B. color schemes
1. analagous
2. complimentary
3. triad
4. mono chromatic
5. split complimentary
6. neutral - accented

C. Creating effects and illusions

D. Backgrounds
1. reshape
2. resize
3. accent

VI. Minor concept: Harmony attained through application

A. Background
1. walls
2. ceilings
3. floors
4. window treatments

B. Furnishings
1. individual items
2. arrange in relation to total area
a. convenience
b. beauty

C. Accessories

1 1. individuality
2. relating to total area

MAJOR CONCEPT: Developing ability to select Home Furnishings

I. Minor concept: Furnishings may be chosen through a wide variety of styles

A. Traditional Furniture
1. Early American
2. Colonial
3. Federal
4. Queen Anne
5. Chippendale
6. Sheraton
7. French Provincial

B. Modern and Temporary
   1. Danish and other national trends
   2. free forms

C. In proportion of area to be furnished

D. Function for the Family
   1. number
   2. strength - soze
   3. care

II. Minor concept: Knowledge of quality workmanship is useful

A. Woods - finishing
   1. quality
      a. solids
      b. veneers
      c. laminated

   2. types
      a. fruitwoods
         1) maple
         2) cherry
         3) walnut
         4) pecan
      b. oak
      c. birch
      d. mahogany

   3. Construction
      a. joints
      b. corners
      c. drawers

B. Refinishing furniture

   1. removing old finish
      a. techniques
      b. supplies
   2. bleaching
      a. techniques
      b. supplies
   3. sanding
      a. mateials needed
      b. procedure
   4. staining
      a. wiping stains
      b. water stains
      c. varnish stains
   5. finishing
      a. a. types
      b. techniques

C. Upholstered Furniture
   1. frame
   2. cushions
   3. springs
   4. fillings
   5. under construction
   6. finishing fabrics
   7. fabric finishes

D. Labels and Tags
   1. information
   2. seals of approval

III. Minor concept: Accessories contribute to mood

A. Mood
   1. gaiety
   2. indiviuality
   3. serenity
   4. dignity
   5. period of furnishings

B. Items Used
   1. lamps
   2. pictures
   3. mirrors
   4. clocks
   5. plants
   6. rugs
   7. unusual objects

MAJOR CONCEPT: Every home should have good lighting

I. Minor concept: Adequate lighting is essential

A. Functional puppose
   1. sight saving
   2. comfort
   3. convenience
   4. safety

B. Decorating purposes
   1. beauty
   2. accent
   3. atmosphere
   4. effect on colors used

II. Minor concept: analyze light needs

A. Tasks to be done

B. Design in work areas

C. Safeguarding people

D. Decorating
1. seasonal decorating
2. beauty spots
3. accents

III. Minor concepts Meeting Home lighting needs

A. Background lighting
1. cove
2. cornice
3. valance

B. Overhead lighting
1. general
2. hard to see areas

C. Determining amount of light needed

MAJOR CONCEPT: Individual Related occupations

I. Minor concept: Construction of Slipcovers and Bedspreads are jobs related to Home Furnishings

A. Constructing Slipcovers
1. fabrics
2. material and equipment needed
3. measuring
4. fitting - placememt of design
5. cutting
6. seam finishing
7. stitching
8. covering cushions

B. Construction Bedsreads
1. fabrics
2. types
3. measuring
4. sewing
5. decorative touches

II. Minor concept: Construction of vaious window treatments may be a valuable skill.

A. Types
1. double sash
2. arched
3. dormer
4. picture
5. casement
6. jalousie
7. wood
8. metal

B. Draperies
1. fabrics
2. operating equipment
3. measuring
4. cutting
5. sewing techniques
6. types of pleats
7. drapery hardware
8. terminology
9. attaching lining

Curtain construction
1. types
2. equipment needed
3. fabrics
4. measuring
5. matting
6. lining
7. finishing - trims

D. Shades
1. fabrics
2. types
3. measuring
4. cutting
5. sewing and construction techniques
6. trimmings

III. Minor concept: Knowledge in the area of floor covering can be useful in a home furnishings related occupation

A. Factors to consider
1. durability
2. economomy of up keep
3. resience
4. warmth
5. light reflection
6. sound absorbtion
7. appearance

B. Types
1. linoleum
2. tile

a. asphalt
b. cork
c. vinyl
d. ceramic
e. rubber
3. wood
4. carpet
5. rugs

IV. Minor concept: Flower arranging is an useful and profitable art.

A. Equipment needed
1. holders
2. container

B. Arrangement for:
1. formal rooms
2. informal or Early American
3. modern rooms

C. Rules

SOME SUGGESTIONS FOR DEVELOPING THE COLOR AND DESIGN UNIT

MAJOR CONCEPT: IDENTIFY ELEMENTS OF DESIGN

Generalizations	Learning Experiences
Good design is the result of highly creative thinking process. Lines have certain psychological effects upon the observer. Combination of different types of lines creates form or shape.	1. Listen to lecture and observe illustrative material on the elements of design. 2. Clip and mount examples illustrating design elements in a feminine room masculine room 3. Create a collage related to design elements. 4. Explore what different types of lines do to you. What feeling do you get? vertical horizontal curved 5. Identify different lines in rooms and decide which predominates

CONCEPT: UNDERSTANDING CLASSIFICATION OF DESIGN

Generalizations	Learning Experiences
Good structural and decorative design shows an orderly arrangement of material used and creates beauty in the finished product.	1. Listen to lecture and observe illustrative material. 2. Clip and mount illustrations of good structural and decorative designs. 3. Analyze situations (Home Economics department, pictures, your home)

Generalizations	Learning Experiences
Structural design is essential to every object, while decorating is the 'luxury' design.	4. Study three types of design natural conventional abstract
The purpose of decorative design is to enrich the surface and make it more beautiful.	5. Collect examples of each type of designs

CONCEPT: STUDYING PRINCIPLES OF DESIGN

Generalizations	Learning Experiences
Principles of design are laws governing the use of the elements of design.	1. Listen to lecture and observes illustrative materials of design principles.
Proportion is the law that governs the use of space. Divisions must be pleasingly related to each other and to the whole.	2. Clips and mounts illustrations of : formal balance informal balance lack of balance rhythm emphasis over emphasis room expressing moods
Unequal space divisions are more interesting than equal.	3. Project: Make a notebook of the design principles.
Balance produces a feeling of rest and contentment.	4. Evaluate different rooms on the basis of design principles. (Home Ec. room)
A room should have at least one wall with formal balance - never more than two.	
Balance is considered not only side to side but top to bottom.	
Rhythm is the law governing movement of the eye.	5. Observe your eye movement in different rooms.

Generalizations	Learning Experiences
The center of emphasis should be located on the wall opposite the door.	6. Find examples of emphasis and discuss just how it is achieved
Harmony is the law that governs use of the principles of design to produce pleasing effects.	7. Collect examples of Harmony, in class show just how the room achieved harmony. Give examples of rooms that do not have harmony.

CONCEPT: LEARNING FACTS ABOUT COLOR

Generalizations	Learning Experiences
We can make practical choice of color if we keep in mind the contributions of psychologists and artists.	1. Listen to lecture and observe illustrative materials, on the qualities, properties, classification, light reflection of color.
Eye strain may be reduced by use of colors correctly.	2. Make a color wheel.
Color has emotional appeal and consciously or sub-consciously. One associates it with a feeling or thing.	3. Experiment with changing values and intensities.
	4. Using paints, experiement with producing different colors.
Light or high values are usually good wall colors.	5. Experiement with a prism for the source of light.
Darker colors called shades make good rug colors .	6. Read additional references.
Warm colors advance and cool colors recede.	7. Experiement with different floor coverings and wall coverings to see the effect of color and texture.
	8. Disscuss terminology.

CONCEPT: USING COLOR SUCCESSFULLY

Generalizations	Learning Experiences
Ability to create beautiful color schemes can be developed through study. A color scheme is a combination of colors which look well together. A room should have one predominate color. Transition from room should be gradual and colors keyed. Colors may hide of create defeats. Light, dark, dull colors used in largest amounts, slightly grayed next and intense least. White, black and grey may be used in any part of any harmony.	1. Listen to lecture. 2. Make an examples of each color harmony. 3. Study other sources to see color schemes in them. textiles scenes wall paper paintings 4. Plan a room using the harmony principle. 5. Discuss what rooms use warm colors and what rooms use cool colors to their advantage. 6. Discuss terminology related to Color.

CONCEPT: ACCESSORIES CONTRIBUTE TO PLEASING ARRANGEMENTS

Generallzations	Learning Experiences
Artistic use of accessories contribute to a better overall design.	1. Collect and display accessories ideas for family rooms. Discuss functions, beauty and harmony with rooms furnishings. 2. Project: Every one make some accessory for any room in the house. 3. Develop criteria for arranging focal point eye to follow one part to another

good proportion
holding objects together

4. Exhibit: assign groups to plan arrangement in the department.

CONCEPT: ARRANGING FURNITURE SUCCESSFULLY

Generalizations	Learning Experiences
Smaller pieces may be placed at right angles to a wall to achieve grouping.	1. Identify rules governing furniture arrangement.
Habits can be encouraged or discouraged through the use of arranging furniture.	2. Observe rules on the opaque projector.
Large pieces of furniture should be placed paralled to the structure of room.	3. Arrange furniture in the department as well as on paper.
Group together pieces of furniture used for one activity.	4. Mount pictures showing correct and incorrect arrangement of furniture
Try to place conversation grouping away from traffic flows.	5. Field Trip to Burniture store. 6. Evaluate groupings. Evaluate other rooms.
Balance furnitre. All heavy around room . Main seating group points to one interest.	7. Make room arrangements for every room in the house. Observe rules.

Evaluation

Evaluation should be made to give the teacher a basis for developing learning experiences, modify course plans and selecting appropriate references and teaching materials.

An integral part of planning a course is selecting some means for checking the progress of each trainee. The course should include:

1. ways of observing each trainee's progress toward achieving objectives and goals.
2. methods of recording observations so progress can be assessed.

Evaluation of trainee accpmplishments should be compiled throughout the training course. Observations made in realistic situations are more valid. Evaluations should take place in the laboratory and practice sessions.

Out on the job the employer can help you evaluate the trainee's progress and will be a direct feed back for you. Most employers find that a rating scale 1,2,3,4,5 is an easier one.

STUDENT'S PERSONAL EVALUATION

Check the appropriate squares: Learning Experiences:	Used everyday	Occas-sionaly	Not Needed	Need More
1. Learning to work and being cooperative with others				
2. Learning to work with employer				
3. Understanding my personal characteristics				
4. Meeting people outside the home				
5. Operating sewing machines				
6. Performed clerical duties				
7. Filing samples or catalogs				
8. Cleaning work area				
9, Taking inventory				
10. Arranging furniture				
11. Preparing displays				
12. Working in wallpapering dept.				
13. Pricing merchandise				
14. cutting material				
15. Installing curtains or drapes				
16. Repair work on furniture				
17. Alterrations in drapes or cubtains				
18. Constructing bedspreads				
19. Constructing curtains				
20. Arranging flowers				
21. Learning sales procedures				
22. Advise customers on products.

PREPARATION FOR A PRE-VOCATIONAL COURSE IN PERSONAL SERVICE

Marjorie Hall

Betty Ottwell

3309

OVERVIEW

This Personal Service curriculum outline is designed to prepare students for employment.

We feel there is a need for the type of service because of the changing families and the role of women in todays society.

With the trend of older people no longer being cared for in the home of their children because of the mobility of the population, and because of the large percentage of women working, the nursing home has become the answer of many older people.

The studies done by Edwin Goldfield show that 44.4 percent of people over sixty five years of age require home care, 24.8 per cent require constant home care and 19.6 per cent require part time home care.

Some recent statistics show that 288,268 women are employed as attendants in hospitals and other nursing type institutions. As a result of this we feel training of young people presents many employment possibilities for them, and that they can be an asset to institutions as well.

Objectives

1. To provide students an opportunity to explore and gain knowledge and information about duties performed in hospitals, nursing homes and homes for the aged. About housekeeping duties, personal services, food services and other areas of employment within these types of institutions.
2. To help students feel the importance of work and improve attitudes toward unselfishly giving of themselves to help others.
3. To help students gain confidence in their work by having solid entry level skills acquired in a classroom situation first.

SEQUENCE OF STEPS TO SETTING UP A PRE-VOCATIONAL CLASS AND PROGRAM

	I.	There would be a level of communication among the administrators, teachers and general public to the extent that would assure that such a need to explore possibilities for a class existed.
Jan.	II.	Choosing a steering committee
	III.	Dissolving of the steering committee
	IV.	Forming the advisory committee
	V.	Survey of the community needs and interests
	VI.	Survey of the students needs and interests
	VII.	Review community survey and identify opportunities for training stations
	VIII.	Send letters and make personal contacts for work stations
Mar.	IX.	Recruitment and selection of student learner
	X.	Complete student applications
	XI.	Interview students and identify more clearly specific opportunities
Apr. to Sept.	XII.	Preparation of training plans
May	XIII.	Forming a Pre-Vocational class
Sept.	XIV.	Forming an activity program (clubs)
	XV.	Use of training plans during school year

STUDENT SURVEY

1. Name_____Sex____ Year in school____Age_____

2. Are you working?_____

3. If number 2 is yes, do you feel you had adequate training to do a good job?_____

4. Would you like to have had more training? Yes_____No._____

5. Do you plan to go to college ? Yes____No_____. Do you plan to go to a vocational school? Yes_____No_____.

6. Do you plan to work after high school? Yes_____No_____.

7. Would you register for a course that would train you for employment in one of the following areas? Yes_____No_____.

PLEASE INDICATE YOUR 1st, 2nd, 3rd, and 4th choice.

Child Development

____ Nursery school assistant
____ Home care of children
____ Child care center aid
____ Community recreation assistant
____ Recreational center aid
____ Home placement service

Clothing

____ Textiles
____ Clerk
____ Alterationist
____ Model
____ Dressmaker
____ Personal shopper
____ Laundry-dry cleaning establishment

Meal Management

____ Salad maker
____ Waitress
____ Hostess
____ Short order cook
____ Bakery-delicatessen assistant
____ Food and/or appliance demonstrator
____ Cook--special phase
____ Hospital Dietetic aide
____ Tray Room Supervisor
____ Institutional cook

Housing, Home Furnishing

____ Clerk in furniture store
____ Gift wrapper
____ Florist's assistant
____ Maintenance worker, housekeeper, custodian
____ Maid (hotel, motel, etc.)
____ Real estate interviewer
____ Landscape helper
____ Window dresser
____ Demonstrator of appliances

Home Management

____ Linen room supervisor
____ Insitutional housekeeper (hospitals, hotels, motels, etc.

____

General

____ Homemaker's service
____ Home employment
____ Personal shopper

Personal Services

____ Nursing home aide
____ Hospital aide
____ Private employment for aged
____ Home patient personal care

This outline is prepared to show the type of training to be done in the classroom, and that which one would expect to be practiced at the training station. Adequate and continuing communication with the tentative employers could assure the teacher that skills and facts to be used on the job were being covered in the pre-vocational classes.

I. Orientation to the wold of work covering such topics as:

1. How to apply for a job
2. Employee responsibilities
3. Development of good wirk habits
4. The importance of proper grooming
5. Laws and regulations affecting the worker
6. Social security
7. Income tax
8. The elements of proper communications
9. Insurance
10. Attitudes concerning work

II. As this prevocational training is clustered around skills and jobs as they relate to the care and service to the aged there would be a block of work to acquaint the student with 1, number and conditions, 2, philosophy 3, characteristics 4, nutrional needs 5, psychological orientation of the aged. There also would be a research of all the possible areas of work that could be expoored for future employment as they relate to the aged.

We need to be educated to accept old age as part of a normal life span. The following are the developmental tasks of older maturity as outlined by Havighurst. Briefly these are:

1. Adjusting to retirement and reduced income
2. Adjusting to decreasing physical strength and health
3. Adjusting to death of spouse
4. Establishing an explicit affiliation with one's age group
5. Meeting social and civic obligations
6. Establishing satisfactory physical living arrangements*

Objectives as they apply to vocational training could be:

1. To have the students understand that ageing is a normal process, and not a separate phase of the life cycle. (Throught programs, specific programs, in the schools we must encourage students to develope interests and abilities which will enhance their later years.)
2. To reject the idea that older persons no longer have a useful function in our society
3. To encourage a more positive stand on the necessity for utilizing the capacities of the older citizen in our communities and society in general
4. To bring about an awareness of the many needs of the older men and women, especially the social, recreational and nutritional needs

---

*Havinghurst, Robert J. Developmental Tasks and Education. Univ. of Chicago Press, 1948 p.65

To bring about some concept of aging, the aging process and of being old, many experiences (field trips, interviews, movies, etc.) would be provided. Also a broad offering of readings should be available to the student. The following bibliography written by Beverly H. Gentis in partial fulfillment of the course requirements for Psychology 465 at Northern Illinois University.

OUTLINE OF AREAS OF INSTRUCTION

FOOD SERVICE

Food service could be team teaching with the foods teacher to acquire basic skills in institutional cookery.

1. Cook's helper
2. Baker
3. Salad maker

DISHWASHER

1. Use of time-study and motion experiments to determine efficiency
2. Use of different dishwashing equipment and efficiency in use
3. Sterilization

	XVI.	Complete application and student agreement form
End of term	XVII.	Evaluate training plans and program. Communicate with advisory committee, administrators, and student tentative employers
Summer	XVIII	Contact local businessmen and assure training stations. Review tentative training plans. Make adjustments to fit program to needs and abilities of students.
Sept.	XIX.	Arrange for students to be interviewed by prospective employers for employment as student learners.
	XX.	When employer has agreed to employ a student, there is a joint meeting of the coordinator, the employer, the student and parent (s) to review and revise the agreement.

CRAFTS

1. Survey of interest
2. Exploring types
3. Becoming acquainted with resources (manuals etc.)
4. Locating and assembling materials
5. Development of some manual skills
6. Developing some skill in teaching others
7. A supply of offerings to fulfill the time, talents and interest of the aged

SERVICE OF FOOD AND DRINK

1. Feed persons when necessary
2. Help ambulatory persons to central dining room
3. Help person to chair and be in room when necessary
4. Arrange attractive trays, serve snacks and juices as needed
5. Keep water pitchers full

LAUNDRY SERVICE

1. Fold and store linens
2. Distribute linens to room
3. Keep inventory of linens

BED MAKING

Hospital method of:

1. Bed making (with and without patient)
2. Removal of soiled linen
3. Making patient comfortable

PERSONAL SERVICES

1. Attend to personal needs
2. Attend to comfort needs
3. Write letters
4. Answer telephones
5. Answer call buttons
6. Take persons shopping
7. Take persons on tours
8. Take persons to visit friends
9. Read to individuals
10. Do personal shopping for persons
11. Listen and communicate
12. Raise and lower head or foot of bed
13. Provide help to showers as required
14. Prepare bath water and equipment and bathe persons when necessary

MAID SERVICE

1. Arragement of flowers
2. Dust furniture and rooms
3. Dust floors
4. Arrange furniture for comfort of person (chairs, tables etc)
5. Control temperature, windows, light and ventilation for comfort of person
6. Clean rooms of discharged persons. Disinfecting when necessary

XXI. There is a continuing functioning of the advisory committee teacher, employer trainer of student, interacting communication of parents, administrators students, teachers, employers and guidance throughout the year.

XXII. The activities program is used to cohese the program.

Spring XXIII. Evaluation of the entire program.

Evaluation

The program will be continually evaluated by the Advisory committee, by the training station personnel, teacher coordinator and students.

The on the job trainer will hold conferences with the student, the coordinator individually and the three persons together will hold conferences and evaluate the trainee and the program. The trainer will not give a final grade but rather evaluate many various aspects, which in turn will be averaged out for the on the job grade.

COVER LETTER FOR

SURVEY OF POTENTIAL EMPLOYMENT AND TRAINING NEEDS

Dear Mr. (Director of Personnel)

We are conducting a survey to determine if (Name of High School) should offer a training program. We are investigating the present supply and demand for trained workers in this area. Your answers will contribute greatly in determining needs for a program.

An advisory committee will summarize the facts from the enclosed questionnaire so that we can determine if there is need for a training program.

Your answers to these questions do not obligate you in anyway. A self-addressed, stamped envelope is enclosed for your use in returning the questionnaire by _____.
(Date)

I wish to thank you for your kind attention and cooperation.

Sincerely yours,

Home Economics Coordinator

OVERVIEW

We will both be conducting a Home Economics Related Occupations course in our respective high schools during the 1970-71 school year. This course will include a related class plus on-the-job training. Due to the newness of such programs and the lack ofwritten materials, we felt it essential to develop a general course outline for the related class, including a few good basic references and suggestions for resource persons. We did not number the units or suggest a time limit for each since we felt to do this would make the guide inflexible and less useful to various school structures. We have listed references after each unit that we felt were particularly helpful. There wasn't time or space to list all the possible references such as many general textbooks already present in home ec departments. There is a general reference list of some books and pamplets at the back of the outline. Also included are samples of many forms, application blanks and evaluation devices which might be used in such a program. These are labeled and described when it seemed necessary. Additional class studies relating to the students' on-the-job training would be included as needed depending on the types of jobs and individual needs. We did not attempt to include these studies in this guide.

JOB ORIENTATION

At the end of this unit, the student should be able to:

EXPLAIN THE COOPERATIVE VOCATIONAL EDUCATION PROGRAM IN OUR SCHOOL.
CORRECTLY COMPLETE THE NECESSARY FORMS IN THE PROGRAM.
RECOGNIZE THE IMPORTANCE OF RULES AND REGULATIONS IN A PROGRAM OF THIS TYPE.

A. What is vocational education?
   1. Purpose
   2. Objectives
   3. Types of programs in our school
   4. Coordinators -- who are they? What do they do?
   5. Role of State of Illinois in vocational education

B. Working rules for the H.E.R.O. program.
   1. Training agreement
   2. Detention policy
   3. Absence procedures
   4. No school-no work policy
   5. Quitting or being fired from job
   6. Daily work forms and procedures

C. H.E.R.O. Club
   1. Function
   2. Meetings -- time, place, etc.
   3. Possible projects

D. Occupational notebook

E. Work permits
   1. How to obtain them
   2. Why they are necessary
   3. What to do with them

F. Transportation to and from job
   1. Student must provide
   2. Necessity for safety -- driving, bicycling, walking
   3. Expenses involved in types of transportation

G. Records and forms
   1. Card for coordinator's file
   2. Personal inventory sheet
   3. Other school requirements

H. Student introductions in class
   1. Name and year in school
   2. Year in HERO
   3. Place of employment and explanation of duties of title

I. Student-Coordinator relationship
   1. Related class content--suggestions from students
   2. Importance of bringing job problems to the attention of the coordinator

J. Importance of the World of Work
   1. Statistics to show need for training
   2. Brief overview of labor picture (additional information under World of Work unit)

REFERENCES:

1. Various forms, records and training agreement included.

2. State of Illinois pamphlets:
   a. Bulletin #7-470, Advisory Committees
   b. Vocational Youth Organizations
   c. Guidelines for Cooperative Vocational Education, Bulletin #9-570.

SUCCESS ON THE JOB

At the end of this unit, a student should be able to:

ACCEPT THE IMPORTANCE OF GOOD HEALTH AND SAFETY PRACTICES.
RECOGNIZE THE NEED FOR SELF-IMPROVEMENT AND ITS INFLUENCE ON JOB SUCCESS.
RELATE THE RELATIONSHIP OF ATTITUDES TOWARD WORK TO SUCCESSFUL EMPLOYMENT.

A. Job Safety
   1. Doctor's release signed by parents (see example of form)
   2. Clothing in regard to particular job and safety
   3. Hazards in particular jobs--how to identify them--fumes, acids, glass, etc.
   4. Simple accident procedures
   5. When and where is smoking permitted?

B. Getting a Good Start
   1. Listen to instructions. Write down things you may forget.
   2. Ask questions not covered or understood.
   3. Acceptance of responsibilities. Be sure your responsibilities are carefully understood.
   4. Spirit of competetion
   5. Desire to improve on the job.
   6. Interest, cooperation, enthusiasm
   7. Consider how worker may be a risk to employer
   8. Negative traits to avoid:
      a. Using a "better" method rather than the one employer prefers
      b. Using company time for personal business
      c. Taking supplies or "samples"
      d. Laziness

C. Know Rules and Regulations on the Job
   1. Care and maintenance of equipment and supplies--learn names and how to spell these.
   2. Hours of work, absences, leaves, time off
   3. Building and grounds maintenance
   4. Regulations for parking your car--also rules for coordinator while visiting on the job.
   5. Unions! Must you join?
   6. Are any jobs forbidden to you do to hazards? Due to special skills or training that you do not have?

D. Job ethics and attitudes
   1. Trade secrets
   2. Confidential reports and transactions
   3. Short-cuts and formulas
   4. Honesty
   5. Loyalty
   6. Willingness to learn and cooperate
   7. Being anon-gossiper
   8. Sell yourself--you are your best asset
   9. Punctuality

E. Grooming
   1. Self-appraisal--what are individual needs for improvement
   2. Habits to avoid
   3. Personal cleanliness
   4. Oral hygiene
   5. Care of skin and hair
   6. Grooming checklists

F. Good Manners
   1. Etiquette versus manners
   2. Manners and Common sense
   3. Why good manners
   4. Manners in the family
   5. Manners in public
   6. Manners on a date
   7. Table manners
   8. How and when to tip
   9. How to make an introduction
   10. Social correspondence
   11. Telephone manners
   12. Ethical conduct

G. Personal Math
   1. Weights and measures
   2. Computing car gas mileage
   3. Working with fractions
   4. Transferring percentages into parts of the whole
   5. Computing weekly gross pay from rate and hours
   6. Computing hourly rate from gross pay and hours
   7. Computing and verifying overtime pay
   8. Computing social security and tax deductions
   9. Computing discounts

H. Personal Spelling
   1. Submit a list of 50 commonly used words on job
   2. Prepare a list of words often used in writing a letter of application
   3. Learn to spell these words until mastered.

I. Working Relationships
   1. Cooperation with co-workers
   2. Work agreements to avoid conflicts
   3. Effect of disposition on working relations
   4. Personality types--how they differ
   5. Methods of releasing tensions effectively
   6. Developing maturity--the whole key to success

Occupations and Careers

Careers in Home Economics

MANAGEMENT OF RESOURCES

At the end of this unit, a student should be able to:

USE ANY OR ALL BANKING SERVICES TO THE BEST ADVANTAGE.
PURCHASE AND PLAN FUTURE INSURANCE NEEDS INTELLIGENTLY.
UNDERSTAND NEED FOR RETIREMENT PLANNING.
UNDERSTAND THE GOOD ANDBAD EFFECTS OF CREDIT IN OUR SOCIETY.
PREPARE INCOME TAX RETURN CORRECTLY.

A. Banks and Banking
   1. Types of banks
   2. Opening an account
   3. Writing checks
   4. Cashing checks
   5. Making deposits
   6. Bank books
   7. Federal Reserve Banks and clearink houses
   8. Checks that come back to you
   9. Service charges
   10. Your bank balance
   11. Protect your cancelled checks
   12. Cashier's check, certified check, traveler's check
   13. Safety deposit boxes and other services

B. Credit and the consumer
   1. Different ways to pay for what you buy
   2. Figuring credit charges
   3. Borrowing money--how and where
   4. How to obtain and keep a good credit rating
   5. Guides to installment buying

C. Insurance
   1. Life insurance
      a. Who needs it?
      b. What are the different types?
      c. When should you buy it?
      d. How much is enough?
      e. Selecting an agent and a company
   2. Health insurance
      a. Who needs it?
      b. Individual versus group
      c. How much is enough?
      d. What does health insurance cost?
   3. Liability insurance
      a. Automobile
      b. Homeowners or renters
      c. Fire and theft
      d. Other

D. Social Security
   1. The "why" ofsocial security
   2. Deductions
   3. Who is covered
   4. How coverage is determined
   5. Old age benefits
   6. Benefits in case of death
   7. Children's benefits
   8. Speaker from local social security office

E. Federal and State income taxes
   1. Brief history of taxes
   2. Speaker from local IRS office—in January if possible
   3. Each student prepares own tax return as project for unit.

F. You and the Law
   1. Getting a lawyer
   2. The rights of an arrested person
   3. Common problems with civil law
   4. Contracts
   5. Fraud
   6. Why young persons need a will

SEEKING EMPLOYMENT

To become aware of acceptable and pleasing appearance as a basic consideration in seeking employment and in remaining employable.

To be made aware of the importance of personal attributes in securing and advancing in an occupation

To achieve a skill in planning as basic to choice of job.

I. Applying for a job

A. Where to find the job
1. State employment service
2. Voluntary organizations
3. School and other educational institutions
4. Commercial employment agencies
5. Friends and relatives
6. Want ads
7. Directories

B. Needed credentials
1. Birth certificate
2. Health certificate
3. Social security card
4. Work permit
5. Resume
a. Name, address, and telephone number
b. Position desired
c. Salary desired
d. Age
e. Education
f. Previous employment
g. Personal information
h. References

C. Application
1. Purpose of application
a. Aid in selection
b. Record
2. Indicates to employer
a. Interests
b. Training
c. Work experience
d. Habits
e. Personal background
3. Information about character
a. Neatness and character of penmanship
b. Thoroughness of answering each question in detail
4. Application blank
a. Follow directions
b. Work out details
c. Answer each question completely and accurately
d. Answer each question truthfully
e. Fill the blanks neatly
f. Use an ink pen

D. The Interview
   1. Be at your best
      a. Physically
      b. Mentally
   2. Appearance
      a. Suitably dressed
      b. Properly groomed
   3. Attitude
      a. Interest
      b. Confidence
      c. Sincerity
      d. Alertness
      e. Enthusiasm
      f. Tact
      g. Courtesy
      h. Cheerfulness
      i. Friendliness
   4. Be punctual
   5. Go to interview by yourself
   6. First impressions are lasting
   7. Procedure for interview
      a. Be poised
      b. Speak freely, distinctly, positively, correctly, and to the point
      c. Be a good listener
      d. Understand clearly about wages
      e. When interview is over, bring to a close promptly
      f. Express sincere appreciation and thanks to employer for his time and consideration
      g. Re-emphasize interest in job
      h. Take you leave in businesslike manner.

E. The Follow-up
   1. Second interview
      a. In person
      b. By telephone
      c. In writing
   2. If position is offered--search is over
   3. If rejected, analyze interview thoroughly to try to discover flaws in behavior or appearance. Try again, profit from failure.

HOW TO STUDY OCCUPATIONS

C O N S I D E R :

A. Nature of the Work

1. What are the activities, duties and responsibilities of the worker in this occupation?
2. What kind of interests underlie the occupation?

B. Mental Requirements

1. Which of the following special abilities are required?

   a. verbal comprehension
   b. reasoning
   c. number ability
   d. space ability
   e. mechanical ability

C. Personality Requirements

1. Will the job require you to be:

   a. sociable?
   b. energetic?
   c. persuasive?
   d. careful about details?
   e. persistent?

D. Educational and Training Requirements

1. What kind of education is necessary?

   a. prefessional
   b. technical
   c. general

2. What level of education is necessary?

   a. graduate study (M.A. - Ph.D.)
   b. college (what degree)
   c. technical - vocational school
   d. high school

3. Apprenticeship necessary?

4. In-service training on-the-job?

5. How gain admission into various types of training?
   How much will it cost?
   How many admitted?

E. Entrance into Occupation

1. Certificate or license needed

   a. formal exam required?
   b. who conducts exam?
   c. how - when apply for exam?

2. Membership in union or professional society necessary?

3. Any special agencies used for employing?

F. Working Conditions

1. Physical conditions

   a. hours
   b. overtime
   c. indoor - outdoor
   d. physical activity - standing or sitting

2. Other conditions

   a. routine
   b. creative
   c. would you work alone

G. Supply and Demand

1. How badly are workers needed in these fields?

H. Income, Promotion, Security

I. Factors (about you) that might affect your admission to the job:

1. Age
2. Sex
3. Health
4. Height
5. Weight
6. Appearance

From filled out by teachers of academic subjects during the school year as a check on the students progress.

IN-PROGRESS REPORT OF COOP STUDENTS

Teacher_____ Date_____

The teacher-coordinators are trying every way possible to help students find success in their on-the-job training, classroom work and be good citizens in your classroom.

Will you please take time to evaluate _____.

Yes No 1. Is this student in danger of failing?

Yes No 2. Does this student actively participate in class discussions?

Yes No 3. Does this student come to class prepared?

Yes No 4. Does this student seem interested in the subject matter?

Yes No 5. Does this student seem to have too many absences in order to find success?

Yes No 6. Does this student voluntarily make up his work?

Yes No 7. Is a slower section in your subject area available?

Yes No 8. Has this student ever used his job as an excuse for not getting work prepared on time?

Yes No 9. May I have a conference with you to discuss this student's situation?

NOTIFICATION OF WORK PROGRAM VIOLATIONS

1. Working at the training station is not allowed unless school is attended that same day. If there are extenuating circumstances, the student must contact his teacher-coordinator and might get permission to work without receiving a penalty. Violations of this rule will result in the following penalties:

FIRST OFFENSE: a warning

_____ student's signature _____ date

SECOND OFFENSE: grade reduction

_____ student's signature _____ date

THIRD OFFENSE: drop from program

_____ student's signature _____ date

2. Quitting a job without the coordinator's permission is not allowed in our work program. Unless there are extenuating circumstances, violations will be dealt with as follows:

Student must stay at school under the coordinator's guidance for the remainder of the school day. After school the student must find a job that is acceptable to the coordinator within 10 school days or be dropped from our work program for the remainder of the term.

_____ student's signature _____ date

3. Each trainee must call his coordinator and trainer on days and/or class periods that he is absent from school. Failure to comply with this requirement will result in demerits that will result in a lower class grade.

MICROCOPY RESOLUTION TEST CHART

NATIONAL BUREAU OF STANDARDS-1963-A

OCCUPATIONAL NOTEBOOK CONTENT

Use a loose leaf notebook and compile the following information, not necessarily in this order:

Name and location of company

History and size of company

Organization pattern

Relationship of firm to community

Products manufactured or services rendered

Names of important people

Company rules and regulations

Prepare drawing of plant

Prepare a list of words (See unit on job success)

Prepare a list of names of people in your department or area

Fill out a sample job application form

Fill out a personal data sheet

Describe your job interview

What questions did you ask?

What questions did you later wish that you had asked?

Write an account of your first day on the job

Do a page on the background of your boss

Interview a fellow employee who has been with the company several years

What are the safety rules where you work?

Summarize by week or month your total earnings, net pay, deductions, etc.

After the first week, keep a weekly log of new things learned on the job.

Keep a list of mistakes that you make on the job.

Keep film notes, class notes, valuable tests in second half of notebook

PARENT LETTER

Dear Parent:

This letter is to introduce you to the Home Economics Related Occupations program. The program is designed to prepare students for work in the field of Home Economics. The program is planned with all students in mind, so they may gain technical and practical experience during high school.

The Home Economics Realated Occupations program in the secondary school is a cooperative plan of action between the school and business where the student is employed during half of his school day. Learning occurs both in the classroom, where related instruction is given, and also on-the-job.

The student's coordinator (a member of the school staff), and his on-the-job supervisor (a person employed by the cooperating business), develop the step-by-step training plan. Together they determine the skills and knowledge the student will experience during his employment.

I am looking forward to a successful year with the Home Economics Related Occupations program. If you have any questions or wish further information, please feel free to contact me.

Sincerely,

Home Economics Related Occupations,
Coordinator

Impressions by coordinator: Appearances, attitude and personality

STUDENT AGREEMENT

The Cooperative Vocational Education program is planned to develop a student academically, economically, and socially. To meet the goal, there are responsibilities the student must realize and he must agree to cooperate in carrying them out to the fullest extent. As a participant in the program, are you willing to assume these responsibilities in the program?

1. To realize that I am under the jurisdiction of the school throughout the school day.

2. To know that the Coordinator is the recognized authority for making adjustments or changes in the training on the job.

3. To know that it is my responsibility throughout the year to be well-dressed and groomed both in school and on the job.

4. To carry out my training on the job in such a manner that I will reflect credit upon myself and upon the Cooperative Vocational Educational Program

5. To perform all my duties in a commendable manner and perform related study assignments with earnestness and sincerity.

6. To work toward the group and individual achievement goals.

7. To be regular in attendance in school and on the job. (This includes days on the job when school is not in session such as: teachers' meeting, Christmas vacations, etc.) Set grade point deduction for absenteeism.

8. To be on time at school and on the job.(Grade point deduction)

9. To notify the coordinator as early in the day as possible on days that I am absent from school.

10. To notify the employer as soon as I know that I will be absent from work.

11. If I am absent from school I must also be absent from work on that day.

12. To know that if I use a car as transportation to and from my work, I will observe all traffic regulations and school policies with extreme care. Any infraction of the traffic laws may be sufficient cause to terminate the use of my car in connection with the Cooperative Vocational Education program.

13. To conduct myself in a satisfactory manner, both on the job and in the classroom or my training may be discontinued and I may be removed from the program.

14. To know that if I am removed from the program due to failure either in the class instruction or work experience that I will receive a failing grade for the program and will lose both credits.

15. To understand that if I am required to leave school because of any disciplinary reasons. I understand that I cannot report to my training station as this is the same as any other classroom subject in which I am enrolled. NOTE: A cooperative training student is not exempt from any disciplinary action levied by the school administration or other teachers.

16. To agree to not quite or change jobs without first talking the situation over with my parents and coordinator.

I fully understand the above statements, and I agree to cooperate in carrying them out to the fullest extent.

STUDENT-TRAINEE TEN POINT EVALUATION SHEET

NAME_____DATE_____

TRAINING STATION_____

The purpose of this evaluation sheet is threefold:

1. To help the employed student learner know his weaknesses and improve;

2. To aid the coordinator in his selection of material for instruction;

3. To enable the employer to know the exact status of the employee.

INSTRUCTIONS: Circle the number which best describes the employee. If you feel that the rating should be between two numbers, circle both numbers. The numbers after each question correspond to the following ratings:

5 - Outstanding
4 - Above average
3 - Average
2 - Below average
1 - Unsatisfactory

1. PERSONAL IMPRESSION: Is the employee consistently neat and clean or personally well-groomed for the standards of the job?
   1 2 3 4 5

2. PERSONAL DISPOSITION AND TEMPERAMENT: Through the eyes of the other employees is this employee friendly, considerate, well-liked, helpful and cooperative?
   1 2 3 4 5

3. ATTITUDE TOWARD JOB: Is the employee enthusiastic, loyal, interested? Does the employee have a wholesome outlook on work and its importance in life?
   1 2 3 4 5

4. ABILITY TO LEARN: Does the employee learn and adapt to new duties and ideas quickly?
   1 2 3 4 5

5. RELIABILITY: Can the employee be counted on when needed? Is an assignment usually carried out properly?
   1 2 3 4 5

6. QUALITY OF WORK: Does the employee maintain the standards desired by the company and take pride in a job well-done?
   1 2 3 4 5

7. QUANTITY OF WORK: Does the employee usually produce the amount of work desired by the company -- does the employee use every minute of the work-day to the best advantage?
   1 2 3 4 5

8. ATTENDANCE AND PUNCTUALITY: Can the employee be depended upon to be on the job and on time? If absent, does the individual always call in to report? Are the reasons for absence justifiable?
   1 2 3 4 5

9. AUTHORITY AND CRITICISM: Does the employee respect the authority of a supervisor and not resent taking orders or criticism?
   1 2 3 4 5

10. DEVELOPMENT:
    A. In what areas do you plan to train this employee?

H.E.R.O. PROGRAM TRAINING AGREEMENT

1. _____ will permit _____
(training agency) (student)
to enter their establishment for the purpose of gaining knowledge and experience as a/an _____.
(occupation)

2. The course of training is designed to run for one school year with a minimum of fifteen hours per week, exclusive of Saturday and Sunday and not to exceed _____ hours.

3. The training will be based on a realistic step-by-step training plan developed by the coordinator and the designated trainer. The student should not be permitted, in the process of gaining occupational experience, to remain in any one operation, job or phase of the operation, beyond the period of time where such experience is of educational value.

4. The school will make provision for the student to meet daily with the teacher-coordinator for related and technical instruction.

5. The student (trainee) will dress to meet the requirements of the job, be loyal and work for the best interests of the employer, maintain a good attendance record, notify the teacher-coordinator and the employer of anticipated absences, and live up to all rules and regulations established by theemployer and the coordinator.

6. All complaints shall be made to and adjusted by the coordinator.

7. The coordinator shall have authority to transfer or withdraw the student when he deems such action to be in the best interest of those concerned.

8. The schedule of compensation shall be agreed on by the training agency and the coordinator in accordance with existing local standards, labor laws, and policies.

9. It will be the duty of the trainer to make a periodic evaluation of the trainee's progress since the trainee will receive one credit towards a high school diploma with the successful completion of the agreement.

10. The parent or guardian will be responsible for helping the student to live up to this agreement.

11. This agreement may be cancelled for sufficient cause provided due notice is given to all parties concerned.

ABSTRACT - This 6-month training program is designed to bring into the Housing Authority of New Orleans (HANO) young, unskilled maintenance trainees having potential for advancement to higher skilled maintenance positions and to provide them training in the specialized type of building maintenance required by the housing authority. The program consists of 158 hours of instruction in 11 categories of building maintenance, upon completion of which trainees must be able to perform the 79 jobs that make up the position of maintenance repairman for HANO. Contents include: (1) brief introductory information, (2) program standards, (3) student selection and qualifications and general information on the program, (4) course outline, and (5) training program schedule, listing time, day, and date of training, category and job number, hours per instructional unit, and instructor. Directions for instructors and various sample forms are also provided. (AW)

Introduction

The Housing Divisional Committee of NAHRO has spent a major portion of the past few years dealing with matters pertaining to the fiscal plight of the management operation of local housing authorities. During these times of ever-increasing costs, it has become apparent that local maintenance people will have to get the maximum benefit from the limited budget funds that are available. A reduction in present maintenance services today can only lead to bigger repair problems tomorrow.

In an effort to assist local management personnel in seeking ways to improve their maintenance programs, NAHRO is publishing this training program format developed and used by the New Orleans housing authority. NAHRO believes this format can serve many LHA's as a guide for developing a similar program.

Because of climate and other factors in different parts of the country, the maintenance needs and training of maintenance personnel may vary from one LHA to another. Nevertheless, NAHRO believes the format of the training program of the New Orleans housing authority is a valid and particularly useful one for any large or medium-size LHA that is concerned with reducing maintenance costs without reducing maintenance services.

A training program of this nature does not have practical application for a very small housing authority. However, the maintenance staff person of such an authority may well be the one who can benefit the most from a training program of this type. A combined training program that could be developed for a large group of small LHA's might be the answer for this need. The necessary vehicle to accomplish this could be any of the following organizations:

1—A large LHA in the area;

2—A state or county agency;

3—A local educational institution;

4—A large industrial or manufacturing concern; or

3374

5—State or regional chapters of NAHRO.

The Southwest region of NAHRO scheduled a series of "shirt sleeve clinics" that have served this purpose. Perhaps something similar would be of benefit in other regions.

Preface

Training of the New Orleans housing authority's maintenance personnel began prior to 1954. At various times throughout the years, we scheduled individual training programs with various manufacturers of equipment in use at the authority. At these sessions, the manufacturers discussed particular techniques that we could employ to better service and maintain the items they produced. Although this is an excellent method by which maintenance employees are exposed to the methods of repair and upkeep of major items of equipment, it does not train them to do the many other important maintenance jobs that are required.

In 1958, we recognized the need for a comprehensive training program that would be geared to the individual needs of the Housing Authority of New Orleans—a training program that teaches the varied skills that are required of a housing authority maintenance man. Our initial training program was developed in cooperation with the New Orleans Area Vocational and Technical School. It was a program divided into four sections, covering a period of 18 months, with 200 hours of related and supplemental instructions.

In 1960, we revised our original program, with a view toward improving the quality of instruction and formalizing the on-the-job training phase of the program. At this same time, we began our association with the Jefferson Parish Training School, which provided the teaching staff, as had the New Orleans Area Vocational and Technical School.

In 1963, some of our maintenance personnel themselves proposed the present concept. They felt that the travel time involved in going to and from the Trade School and type of instruction presented could best be accomplished at one of our project sites and with HANO personnel. We agreed and, in 1964, we incorporated some of these suggestions into our present training standards. We selected some of our more experienced maintenance personnel, both skilled and supervisory and gave them the job of preparing instructional material for the program. The response could not have been foreseen. They prepared mockups, displays, and training aids that reflect the ingenuity and technical experience of the instructors. Our training room is a permanent set-up in the William J. Guste Homes project.

3376

We have limited the number of students to 15 and the program runs approximately six months. We have found that 15 is about the optimum number for this type of training.

In conjunction with our training program, we have attempted to promote trainees who have successfully completed the instruction and have arranged for State Civil Service merit examinations to be given them at various project sites. From the test results, we have established promotional registers from which skilled and semi-skilled maintenance vacancies have been filled.

From its very limited beginning, the HANO maintenance training program has evolved into an integral part of our overall maintenance program. Frankly, without it we could not have begun to service the needs of our tenants.

J. GILBERT SCHEIB
Executive Director
Housing Authority of
New Orleans

I. Maintenance Training Program Standards

Foreword

The Housing Authority of New Orleans has developed a training course in building maintenance tailored to the job of a maintenance repairman. The course is conducted by qualified authority maintenance personnel in an authority-owned training center; it stresses the demonstration and application method of instruction. The authority uses this course as a means of improving the quality of maintenance work done on all projects.

Objectives

The objective of this training program is to develop a thoroughly capable work force, well-versed in the theory and practice of building maintenance. It provides an orderly and accurate method of instructing employees interested in upgrading themselves in the acquisition of the necessary skills to do the jobs required of a maintenance repairman and to do them well. It serves as an orderly and uniform method of instructing new employees in the acquisition of similar skills.

Content

The training program consists of 158 hours of instruction in 11 categories of building maintenance. A trainee who completes the course will have been shown how to do—and will have demonstrated the ability to do—the 79 jobs that make up the job of a maintenance repairman of the Housing Authority of New Orleans.

Maintenance Training Committee

The training program is administered by a Maintenance Training Committee composed of the key maintenance and management supervisory employees, as appointed by the General Housing Manager of the authority. Duties of the Maintenance Training Committee are:

1. To review applications for the training program and to place accepted applicants under agreement;
2. To designate employee-instructors and to assign these employees units of instruction;
3. To establish minimum requirements for classroom instruction;
4. To periodically examine trainees to determine their progress in school;

3378

5. To maintain records of trainees' progress in the program;
6. To hear and adjust all trainees' complaints;
7. To assume responsibility for any other duties that will contribute to proper training.

Organization

Each of the 79 jobs is considered a unit of instruction. Employee-instructors are assigned one or more units of instruction.

It is the instructor's responsibility to prepare a lesson plan; to procure the necessary training aids; to arrange for facilities to conduct the instruction; and to certify trainees who have satisfactorily completed the unit of instruction.

Each of the 11 categories has been assigned to a maintenance supervisory official whose responsibility will be to supervise the preparation and conduct of all units of instructors in that category.

In the administration of this program, employee-instructors are directly responsible to category coordinators and the category coordinators are directly responsible to the Maintenance Training Committee.

Required Instruction

Classes meet in accordance with a published training schedule. A trainee is required to attend each unit of instruction scheduled.

As each unit of instruction is completed, the instructor certifies a trainee, if the trainee has attended the required hours in the unit and has *demonstrated* his ability to do the job.

Trainees who are absent or trainees who are unable to demonstrate the ability to do the job are given additional make-up instruction at the end of the normal term of training.

Selection Of Trainees

All maintenance employees on a permanent or provisional appointment basis are eligible to enroll as trainees on a voluntary basis. Completion of the program is considered evidence that an employee seeking promotion is trained for the job. All new employees appointed to the class of Maintenance Repairman I or II, who are to be assigned duties in building maintenance, are required to enroll in the training program as a condition of employment, unless excused by the training committee. Applications for enrollment are filed with the Maintenance Training Committee. If accepted, the application is considered a

3379

signed agreement, the essence of which is that the authority may release a new employee for failure to maintain satisfactory progress in the school.

Qualifications Of Trainees

Trainees must meet the minimum Civil Service qualifications of the class to which they are appointed and, in addition, possess sufficient intelligence to satisfactorily complete the required instructions.

Term Of Training

The normal term of training is 158 hours, given over a six-month period. Other special terms may be instituted by the committee to cover special situations. Training is scheduled for six hours a week, four hours one morning a week and two hours one night a week. Time devoted to instruction after normal work hours is not considered as hours of work; trainee is not paid for such time.

Periodic Examination

A review of a trainee's status in relation to his progress in the required instructions is made periodically by the training committee. In the event a trainee does not show satisfactory progress, the committee has the power to recommend his removal from employment with the authority or to take such lesser action as is deemed appropriate.

Certificate Of Completion

Completion of the training program is predicated upon certification by the instructor that the trainee has satisfactorily completed all prescribed hours of instruction and has demonstrated ability to do the job. The Maintenance Training Committee issues a certificate that the trainee has completed his training and is a qualified maintenance repairman.

Records

A record of attendance and completion of each unit of instruction is maintained by the individual instructors. A master record of the trainee's progress is maintained by the joint committee. Trainees are encouraged to maintain their own records.

Adjustment Of Differences

Any disagreement or complaint relating to the training program is taken up with the training committee.

Modification

These standards may be modified at any time by action of the committee.

3380

II. Training Program for Maintenance Trainees

Reason For Training

The purpose of this program is to bring into the Housing Authority of New Orleans young, unskilled maintenance trainees who have potential for advancement to higher skilled maintenance positions and to give them training in the specialized type of building maintenance required by the Housing Authority of New Orleans. A program of this type is deemed essential in view of the variety of skills a maintenance employee must possess to adequately perform repairs in all of the several building trades.

Classification And Pay

The employee to be trained is appointed to the State Civil Service class of "Laborer, Utility." Trainees enter at the entrance rate for this class and, upon satisfactorily completing the training program, are advanced to the Civil Service class of Maintenance Repairman I, with an accompanying increase in salary.

Rates of pay are based on the current wage determinations of the Department of Housing and Urban Development.

Qualification Requirements

Applicants for trainee positions must have at least two years of high school education; must be at least 18 years of age, but must not have reached their 30th birthday; must be physically fit to perform the duties required of a maintenance repairman; and must possess aptitude for this work.

Method Of Selection

Under authority granted by the Department of State Civil Service, trainees are secured from the open market through the Louisiana Employment Service. Applicants furnished by the employment service must meet the basic qualification requirements and must have passed a test designed to measure aptitude for this work. Selection is based upon a suitability investigation, personal interview, and indication of a positive interest in a career with the housing authority. In selection, preference is given to applicants who have completed active military service or who are discharging their obligated military service through service in an armed forces reserve component.

3385

3381

Length Of Training

The training program last six months, during which time the trainee is required to complete the authority's currently approved course in building maintenance, which is taught in the authority's Maintenance Training Center and, in addition, to complete six months of intensive on-the-job training under the guidance of a skilled maintenance mechanic. Formal training ends upon certification by the authority that the trainee has completed the on-the-job training phase and the related instruction. The trainee is then promoted to the class of Maintenance Repairman I. Further advancement and retention depends on the employee's demonstrated abilities and the needs of the authority.

Outline Of Training

1. General Orientation Training

A trainee is given extensive orientation training to familiarize him with authority policies and procedures which affect him. In general, this training follows the guide used to orient a new employee, with special emphasis on the trainee's obligation as a trainee. This training is conducted by the chief of maintenance.

3382

2. Specific Orientation

In addition to this general orientation, the trainee is given specific orientation to those things that a Maintenance Repairman I must know, but which are not otherwise covered in the training to follow, such as accounting for materials and supplies; job layout; labor distribution. This orientation is the responsibility of the trainee's immediate supervisor.

3. Building Maintenance Course

Trainees are required to complete the course of instruction which are described in the authority's Maintenance Training Standards (Part I) and detailed in Parts III and IV.

4. On-the-Job Training

When not attending group instruction, trainees work alongside a skilled maintenance mechanic, functioning as a helper to this mechanic in the performance of the mechanic's regular duties.

Records and Reports

Trainees are required to maintain normal records of labor distribution. Whenever work is performed as a helper to a mechanic as part of the on-the-job training phase, the mechanic doing the training initials that entry on the daily work record of the trainee.

3382

Records of attendance and training in the course of instruction in building maintenance are kept, as specified in the Maintenance Training Standards (Part I).

Trainees are evaluated by the maintenance foreman at the end of the first two months of training, at the end of four months of training, and just prior to the end of the sixth month of training on a form specially provided for this evaluation (see page 32).

Project managers meet regularly with trainees to counsel them as to their progress. They endorse the evaluation reports of maintenance foremen.

The chief of maintenance reviews the trainee's complete file immediately prior to the end of the sixth month of training. Particular attention is given to:

1. The maintenance foreman's evaluation;
2. The trainee's progress in on-the-job training;
3. The trainee's progress in related instruction in the training center; and
4. Comments of the project manager.

The chief of maintenance then recommends to the general housing manager that the trainee be advanced to Maintenance Repairman I, or—in the event of unsatisfactory progress—some other action.

The following are considered to be evidences of unsatisfactory progress:

1. Demonstrated lack of interest;
2. Sub-standard performance of practical assignments in on-the-job training; or
3. Inability to absorb course material in related instruction.

Completion Of Training

After final evaluation by the chief of maintenance and concurrence therein by the general housing manager, the trainee is promoted to the class of Maintenance Repairman I.

Disposition Of Trainees Determined Unsatisfactory

At any time during the training period that it becomes evident that a trainee is not progressing satisfactorily, he is dropped from the training program and demoted to an unskilled position, if one is available, or removed from employment.

3383

III. Maintenance Training Course Outline

Instructional Units		*Hours*
Carpentry		
Job 1.	Re-hanging screen doors and windows (wood and aluminum)	2
Job 2.	Re-wiring screen doors and windows	2
Job 3.	Replacing door stiles and rails on screen doors, windows	3
Job 4.	Repairing and re-hanging doors (wood and metal)	2
Job 5.	Repairing and replacing door frames	3
Job 6.	Repairing and replacing door closers	2
Job 7.	Repairing door locks, closers	1
Job 8.	Replacing door knobs, locks, and hinges	1
Job 9.	Repairing and replacing thresholds and weather-stripping on doors and windows	1
Job 10.	Installing window sash (wood and aluminum)	2
Job 11.	Replacing sash balances and other hardware	2
Job 12.	Glazing window lights	1
Job 13.	Removing and replacing wood block tiles	2
Job 14.	Removing and replacing wood strip flooring	2
Job 15.	Sanding and re-finishing wood flooring	2
Job 16.	Installing asphalt tile flooring	2
Job 17.	Replacing baseboard and baseboard molding	1
Job 18.	Replacing wooden and metal stair rails	2
Job 19.	Repairing kitchen cabinets—doors and shelves	3
Job 20.	Repairing kitchen work-tables	2
Job 21.	Replacing medicine cabinet mirrors and doors	1
	Total	39

Masonry

		Hours
Job 1.	Patching cracked or damaged plaster	2
Job 2.	Repairing or replacing cement blocks	2
Job 3.	Replacing ceramic tiles	2
Job 4.	Replacing cracked or loose brick	2
Job 5.	Tuck pointing loose mortar joints	2
Job 6.	Re-caulking around windows, doors, and lintels	2
Job 7.	Repairing chipped concrete steps and porches	2
Job 8.	Paving or patching small paved areas	2
Job 9.	Replacing access doors and grills	2
	Total	18

Roofing

Job 1.	Replacing clay tile and asbestos shingles on roof	2
Job 2.	Repairing built up roofs	3
Job 3.	Repair and replacing of gutters, downspouts	2
Job 4.	Repairing and replacing flashing	2
	Total	9

3385

Painting

		Hours
Job 1.	Preparation of walls for application of paint	2
Job 2.	Applying paint to interior and exterior walls and to surfaces of appliances	4
Job 3.	Repairs to metal porch rails and columns	2
	Total	8

Space Heaters

Job 1.	Removing and installing space heaters	1
Job 2.	Cleaning and adjusting main burner and flame	1
Job 3.	Removing and replacing thermostat control	1
Job 4.	Testing for gas leaks	1
	Total	4

Hot Water Heaters

Job 1.	Removing and installing hot water heaters, testing for gas leaks	3
Job 2.	Replacing temperature and pressure relief valve	2
Job 3.	Repairing, adjusting, or replacing thermostats	2
Job 4.	Adjusting pilot and main burners	1
	Total	8

Ranges

Job 1.	Removal and installation of gas and electric ranges	1
Job 2.	Adjusting top and oven burners	1
Job 3.	Adjusting oven thermostats	2
Job 4.	Reconditioning gas ranges	2
	Total	6

Refrigerators

Job 1.	Trouble shooting malfunctions of refrigerators	4
Job 2.	Checking temperature controls and motor circuits	4
Job 3.	Replace switches, thermostats, and relays	3
Job 4.	Replacing door seals and door handles	2
Job 5.	Replacing light switches and supply cords	1
	Total	14

3386

Plumbing		*Hours*
Job 1.	Unstopping, repairing, and replacing water closets—including tank, flush assembly, and seat	4
Job 2.	Replacing water faucets, washers in faucets and re-dressing bad faucet seats	4
Job 3.	Repairing and replacing continuous waste on sink	2
Job 4.	Repair and replacing of p-trap on p.o. plug face bowl	
Job 5.	Repairing and replacing copper and galvanized water pipe	3
Job 6.	Repairing lead joints (soil pipe)	2
Job 7.	Replacing broken gas lines to gas-fired equipment	2
Job 8.	Testing for gas leaks—interior and exterior	1
Job 9.	Repairs to sub-surface drain lines (terra cotta soil pipe)	2
	Total	26

3387

3387

Electricity		*Hours*
Job 1.	Introduction to electricity	1
Job 2.	Replacing switch boxes and outlet boxes	2
Job 3.	Replacing interior wiring	2
Job 4.	Replacing and repairing fixtures	2
Job 5.	Replacing convenience outlets and wall switches	1
Job 6.	Replacing three-way switches	1
Job 7.	Servicing fluorescent fixtures	2
Job 8.	Tracing and locating shorts in circuits	3
Job 9.	Handling hot wires in absence of disconnect	1
Job 10.	Setting and replacing time clocks	1
Job 11.	Repairing and replacing relays	2
	Total	18
Safety		
Job 1.	Safety on the job	4
Job 2.	First aid	2
Job 3.	Fire prevention and extinguishment	2
	Total	8
	Grand Total	158

IV. Maintenance Training Program Schedule

Class No. 3: Maintenance Training Center, William J. Guste Homes, La. 1-15
Starting Date: February 5, 1969; Completion Date: October 22, 1969

Ronald R. Brignac, Deputy Executive Officer
J. M. Orlesh, Jr., Personnel Officer
R. Evans, Chief of Maintenance
B. W. Cooper, Administrative Officer
M. A. Edwards, Jr., Administrative Officer
J. Gilbert Scheib, Executive Director (ex-officio)

Administrative Training Staff:
William J. Theard, HANO, Coordinator
Robert Marti, HANO, Assistant Coordinator
George Tumey, Central Repair Department (CRD), Assistant Coordinator

Shop Training: Carpentry, Plumbing, Gas Safety, Painting, Electricity, Space Heaters, Water Heaters, Refrigerators, Masonry and Roofs

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 5:00 p.m. Wednesday 2/5/69	1. Opening Ceremonies 2. Indoctrination 3. Film—		2	William J. Theard
	Accident Prevention— Lifting and Strain— Types of Injuries		2	William McCray
1:00 p.m. - 3:00 p.m.	Carpentry Job #1	Repairing and replacing door frame and trim.	2	B. Sholl La. 1-3
3:00 p.m. - 5:00 p.m. Wednesday 2/12/69	Carpentry Job #2	Replacing stiles and rails on window and door screens.	2	
1:00 p.m. - 3:00 p.m.	Carpentry Job #3	Rewiring screen doors and windows (wood and aluminum).	2	P. Gaudin, Jr. La. 1-2
3:00 p.m. - 5:00 p.m. Wednesday 2/19/69	Carpentry Job #4	Repairing and rehanging screen doors.	2	

3389

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 3:00 p.m.	Carpentry Job #5	Re-hanging window screens (wood and aluminum).	2	L. Marshall La. 1-14
3:00 p.m. - 5:00 p.m. Wednesday 2/26/69	Carpentry Job #6	Repairing and replacing door closers.	2	
1:00 p.m. - 5:00 p.m. Wednesday 3/5/69	Carpentry Job #7	Installing and replacing mortise type door locks.	4	B. Sholl La. 1-3
1:00 p.m. - 3:00 p.m.	Carpentry Job #8	Installing and replacing bore type locks.	2	A. Bibbens La. 1-16
3:00 p.m. - 5:00 p.m. Wednesday 3/12/69	Carpentry Job #9	Repairing door locks (mortise and bore type).	2	
1:00 p.m. - 3:00 p.m.	Carpentry Job #10	Installing window sashes (wood and aluminum).	2	P. Gaudin, Jr. La. 1-2
3:00 p.m. - 5:00 p.m. Wednesday 3/19/69	Carpentry Job #11	Replacing sash balances and window latches.	2	
1:00 p.m. - 3:00 p.m.	Carpentry Job #12	Glazing window lights.	2	B. Sholl La. 1-3
3:00 p.m. - 5:00 p.m. Wednesday 3/26/69	Carpentry Job #13	Repairing bathroom medicine cabinets.	2	

3390

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 3:00 p.m.	Carpentry Job #14	Replacing thresholds and installing weather stripping on doors and window frames.	2	A. Bibbens La. 1-16
3:00 p.m. - 5:00 p.m. Wednesday 4/2/69	Carpentry Job #17	Repair and replacing of metal stair hand rails.	2	
1:00 p.m. - 3:00 p.m.	Carpentry Job #15	Repairing kitchen work tables.	2	B. Sholl La. 1-3
3:00 p.m. - 5:00 p.m. Wednesday 4/9/69	Carpentry Job #16	Repairing wall-type kitchen cabinets.	2	
1:00 p.m. - 3:00 p.m.	Flooring Job #1	Removing and replacing wood strip flooring.	2	C. Stevens CRD
3:00 p.m. - 5:00 p.m. Wednesday 4/16/69	Flooring Job #2	Removing and replacing wood floor blocks.	2	
1:00 p.m. - 3:00 p.m.	Flooring Job #3	Sanding and preparing floors for refinishing.	2	F. Young CRD
3:00 p.m. - 5:00 p.m. Wednesday 4/23/69	Flooring Job #4	Replacing baseboard and molding.	2	
1:00 p.m. - 3:00 p.m.	Flooring Job #5	Refinishing wood block flooring.	2	F. Young CRD
3:00 p.m. - 5:00 p.m. Wednesday 4/30/69	Flooring Job #6	Installing asphalt tile floors.	2	

3391

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 5:00 p.m. Wednesday 5/7/69	Plumbing Job #1	Measuring, cutting and threading pipe. Repairing and replacing copper and galvanized water pipe.	4	A. Cheron CRD
1:00 p.m. - 3:00 p.m.	Plumbing Job #2	Replacing and repairing gas lines to gas fired equipment and testing for gas leaks.	2	A. Cheron CRD
3:00 p.m. - 5:00 p.m. Wednesday 5/14/69	Plumbing Job #3	Repairing and replacing continuous waste on sinks.	2	
1:00 p.m. - 5:00 p.m. Wednesday 5/21/69	Plumbing Job #4	Unstopping, repairing and replacing water closets, including tanks, flush assembly and seats.	4	W. Gerard La. 1-15
1:00 p.m. - 4:00 p.m.	Plumbing Job #5	Replacing faucets, faucet washers, diverter and swing type spouts. Repairs and redressing bad faucet seats.	3	A. Cousins La. 1-5
4:00 p.m. - 5:00 p.m. Wednesday 5/28/69	Plumbing Job #6	Repairing and replacing "p" traps and P.O. plugs on face bowl.	1	

3392

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 3:00 p.m.	Plumbing Job #7	Repairing and replacing cast iron soil pipe.	2	A. Cheron CRD
3:00 p.m. - 5:00 p.m. Wednesday 6/4/69	Plumbing Job #8	Repairing and replacing sub-surface drain lines (terra-cotta and cast iron).	2	
1:00 p.m. - 3:00 p.m.	Refrigerator Job #1	Checking and replacing of temperature controls and cabinet light switches.	2	D. Farrell CRD
3:00 p.m. - 5:00 p.m. Wednesday 6/11/69	Refrigerator Job #4	Replacing and adjusting door seals and door locks.	2	
1:00 p.m. - 5:00 p.m. Wednesday 6/18/69	Refrigerator Job #2	Malfunctions and trouble shooting.	4	D. Farrell CRD
1:00 p.m. - 5:00 p.m. Wednesday 6/25/69	Refrigerator Job #3	Replacing relays and checking motor circuits.	4	D. Farrell CRD
1:00 p.m. - 2:00 p.m.	Space Heaters Job #1	Removing and installing (testing for leaks)	1	A. Cheron CRD
2:00 p.m. - 3:00 p.m.	Space Heaters Job #2	Cleaning and adjusting burner flame.	1	
3:00 p.m. - 5:00 p.m. Wednesday 7/2/69	Space Heaters Job #3	Replacing and adjusting thermostat controls.	2	

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 2:00 p.m.	Ranges Job #1	Removing and installing electric ranges.	1	G. Williams La. 1-15
2:00 p.m. - 3:00 p.m.	Ranges Job #2	Adjusting top and oven burners.	1	
3:00 p.m. - 5:00 p.m. Wednesday 7/9/69	Ranges Job #3	Reconditioning gas and electric ranges.	2	
1:00 p.m. - 3:00 p.m.	Ranges Job #4	Adjusting oven thermostats.	2	A. Cheron CRD
3:00 p.m. - 5:00 p.m. Wednesday 7/16/69	Hot Water Heaters Job #1	Removing, installing and testing for gas and water leaks.	2	
1:00 p.m. - 2:00 p.m.	Hot Water Heaters Job #2	Adjusting pilot and main burner.	1	A. Cheron CRD
2:00 p.m. - 3:00 p.m.	Hot Water Heaters Job #3	Replacing and adjusting T&P valves.	1	
3:00 p.m. - 5:00 p.m. Wednesday 7/23/69	Hot Water Heaters Job #4	Repairing, adjusting and replacing thermostats.	2	
1:00 p.m. - 5:00 p.m. Wednesday 7/30/69	Masonry Job #1	Patching cracked or damaged plaster.	4	J. Morris La. 1-15

3394

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 3:00 p.m.	Masonry Job #2	Plastering on masonry and metal lath walls.	2	J. Morris La. 1-15
3:00 p.m. - 5:00 p.m. Wednesday 8/6/69	Masonry Job #3	Plastering large areas of walls and ceilings.	2	
1:00 p.m. - 3:00 p.m.	Masonry Job #4	Replacing and repairing cement blocks.	2	L. Poree La. 1-7
3:00 p.m. - 5:00 p.m. Wednesday 8/13/69	Masonry Job #5	Replacing cracked or loose bricks and tuck pointing mortar joints.	2	
1:00 p.m. - 3:00 p.m.	Masonry Job #6	Repairing chipped concrete porches and steps.	2	J. Labostrie La. 1-8
3:00 p.m. - 5:00 p.m. Wednesday 8/20/69	Masonry Job #7	Paving and patching small paved areas.	2	
1:00 p.m. - 3:00 p.m.	Masonry Job #8	Replacing ceramic tiles.	2	L. Poree La. 1-7
3:00 p.m. - 5:00 p.m. Wednesday 8/27/69	Masonry Job #9	Recaulking around windows, doors, and lintels.	2	
1:00 p.m. - 3:00 p.m.	Roofing Job #1	Repairing built-up roofs.	2	E. L. Sorina CRD
3:00 p.m. - 5:00 p.m. Wednesday 9/3/69	Roofing Job #2	Replacing clay tiles and asbestos shingles.	2	
1:00 p.m. - 5:00 p.m. Wednesday 9/10/69	Roofing Job #3	Repairing and replacing flashing, gutters, and downspouts.	4	E. Braud La. 1-8

3395

Time, Day, Date	*Category and Job Number*		*Hours*	*Instructor*
1:00 p.m. - 3:00 p.m.	Painting Job #1	Interior and exterior painting, wood and metal (types of paint and their application).	2	C. E. Harrell La. 1-7
3:00 p.m. - 4:00 p.m.	Painting Job #2	Surface preparation and paint application.	1	
4:00 p.m. - 5:00 p.m. Wednesday 9/17/69	Painting Job #3	Refinishing of wood trim, wood and metal cabinets and appliances.	1	
1:00 p.m. - 3:00 p.m.	Electricity Job #1	Introduction to electricity and basic electric wiring.	2	T. Jeffrion, Jr. C.R.D.
3:00 p.m. - 4:00 p.m.	Electricity Job #2	Interior electric wiring systems.	1	
4:00 p.m. - 5:00 p.m. Wednesday 9/24/69	Electricity Job #3	Safety in handling live conductors.	1	
1:00 p.m. - 3:00 p.m.	Electricity Job #5	Tracing and locating short circuits.	2	E. Nickerson La. 1-14
3:00 p.m. - 5:00 p.m. Wednesday 10/1/69	Electricity Job #6	Replacing interior wiring.	2	
1:00 p.m. - 3:00 p.m.	Electricity Job #7	Servicing and installing fluorescent fixtures.	2	J. Grant La. 1-8
3:00 p.m. - 5:00 p.m. Wednesday 10/8/69	Electricity Job #4	Replacing convenience outlets, 3-way switches, ceiling and bracket fixtures.	2

V. Directions for Instructors

Effective Instruction

1. The supervisor who has not devoted some conscious thought and planning to the techniques of how to instruct is often an ineffective teacher for some of the following reasons:

—He teaches his job in the way he learned it.

—The instructor may think of his work in bigger units than the trainee can readily grasp.

—The instructor may neglect to teach the entire operation.

—The instructor may stress the things that seem important to him.

—He may forget why a thing is done a certain way.

—Because he is used to *doing* rather than *teaching*, the instructor may become impatient with a trainee who fails to learn quickly.

—The instructor may find it difficult to teach easily, as he is not skilled in using the most appropriate words to convey his thoughts.

—He may not properly prepare himself before instructing.

—The instructor may be deficient in a knowledge of human relations and, hence, may antagonize his learner.

2. To be effective, a job instructor should know something about teaching methods and must be skilled in instructional techniques to get the most from his men.

3398

Steps in Instructing

Step 1:

Prepare the Employee for Instruction

Put him at ease.

Explain the job thoroughly and what it means.

Create an interest in the class.

Step 2:

Present the Job—Tell and Show Him

Follow your job breakdowns.

Explain the job thoroughly, each phase at a time.

Stress all important points.

Don't teach too much at one time.

Use words that are easily understood.

Give student a chance to do the talking.

Set an interest in the class that will hold students' attention.

Give reasons that will be beneficial to students.

Show one thing at a time.

Teach everything you will expect him to learn in return.

3399

Step 3: Try Out Performance

Have him perform the job.

Have him give you the entire breakdown on specific job that he has learned.

Correct errors and omissions as he progresses, keeping the following points in mind:

- Set student at ease and avoid criticism;
- Explain before you correct;
- Let the trainee prove himself;
- Don't go above trainee's knowledge;
- Don't challenge student in front of others;
- Don't hold trainee for mistakes.

Encourage him.

Get him to learn what he has missed.

Continue with your student until you know he qualifies.

Step 4: Follow-Through

Give him the chance to do the job himself.

Give students a chance to ask questions and encourage them to follow through on what they don't understand.

Check student constantly and encourage him.

Let him know how he is doing and give him a chance to express himself at free will.

VI. Forms

Guidelines for Family Life and Sex Education, Grades K-12. Curriculum Bulletin No. 32.

Minnesota State Dept. of Education, St. Paul.
MF AVAILABLE IN VT-ERIC SET.
Documents Section, Minnesota State Dept. of Education, Room 140, Centennial Building, St. Paul, Minnesota 55101.
PUB DATE - 70 101p.

DESCRIPTORS - *FAMILY LIFE EDUCATION; *SEX EDUCATION; *CURRICULUM GUIDES; ELEMENTARY GRADES; INTERMEDIATE GRADES; BEHAVIORAL OBJECTIVES; EDUCATIONAL OBJECTIVES; LEARNING ACTIVITIES; RESOURCE MATERIALS; TEACHER WORKSHOPS; SECONDARY GRADES

ABSTRACT - Developed during elementary and secondary teacher workshops and reviewed by a State coordinating committee, this curriculum guide contains suggested long-range behavior goals and content for the primary, intermediate, junior high, and senior high grade levels. An introductory section covers philosophy, need, suggestions for teachers, implementation, handling controversial issues, preservice and inservice education, and assessing the program. Generalizations, learning experiences, resources, and evaluation techniques for each grade level accompanying these goals: (1) Acquire a maturing self-image, (2) Understand the nature, purpose and roles of the family and its members, (3) Demonstrate a pattern of relationships based upon responsibilities to oneself and others, (4) Understand the influences of political, philosophical, religious, and cultural ideologies on sexuality, (5) Develop and employ a personal code of ethics, (6) Accept personal responsibility for positive and constructive influences on society's concerns for family living and sexuality, (7) Employ suitable and effective communication about human sexuality, and (8) Understand anatomical, physiological, psychological, and sociological maturation as related to human sexuality. Printed and audio-visual resources and sources for informational materials are included. (SB)

In Memoriam

These guidelines are dedicated to the memory of Dr. Helen Starr who served as the chairman of the State Coordinating Committee on Family Life and Sex Education and the teacher workshops. This publication evolved under her direction.

Until her untimely death, February 18, 1969, Dr. Starr gave unselfishly of her time and talents to promote a more effective educational program for Minnesota children and youth.

May these guidelines help teachers and students exemplify the model she portrayed.

Commissioner of Education

3406

Preface

The development of *Guidelines for Family Life and Sex Education, Grades K-12*, was made possible through funds from Title V, Elementary and Secondary Education Act. Significant contributions to the development of these guidelines were made by the teacher workshop committees on family life and sex education and the State Coordinating Committee on Family Life and Sex Education.

Elementary and secondary teacher workshops were conducted to develop the suggested content for each grade level. After being reviewed by the teacher workshop committees, the suggested content was then further reviewed by the State Coordinating Committee on Family Life and Sex Education. This committee also made specific suggestions for the long-range goals.

The State Department of Education considered it essential to develop these guidelines as a followup to the Position Statement on Family Life and Sex Education which was adopted by the Minnesota State Board of Education, November 1966. It is hoped that this publication will present a framework for developing the best comprehensive program possible to help meet the needs of children and youth in a highly complex society.

Introduction

Philosophy

An increasingly complex society is making increasingly complex demands upon children and youth in family life and sex education. Our society has stimulated young people to reach an early superficial maturity. The blatant sex in society has its impact through mass media which contributes little to the development of desirable attitudes. This has caused a greater need for guidance and education to foster correct information and desirable attitudes, behavior, and values in human sexuality. The basic issue is not whether or not Minnesota children and youth should have family life and sex education — they will receive it one way or another. The basic issue is whether they receive it from their peer group, from the street, and from experience alone or whether they get it from the home, church, and school working cooperatively.

The dignity of the person requires that each individual receive an education in family life and sex education. Helping individuals attain maturity in human sexuality and to understand human sexuality is a privilege and responsibility of every age. Parents have the prime responsibility for the inculcation of moral values to their children, but the school needs to support and supplement the parents. One way to provide a more meaningful life experience is to provide school children with an opportunity to come to grips with the problems and issues inherent in family life and sexual behavior before they become problems to the individual and society and before the individual is faced with situations for which he is not equipped to make desirable and socially acceptable judgments.

Education for family life and sex education, in its broadest form, is concerned not only with physical relations but, more importantly, with emotional and social interrelationships. Within this context, these guidelines are provided as an initial step to strengthen instruction in wholesome attitudes and respect for all cultures in the area of family life and sex education and to focus attention on the understanding of the self within the context of human growth and development.

ife and sex education, in its broadest form, h physical relations but, more importantly, interrelationships. Within this context, these an initial step to strengthen instruction in espect for all cultures in the area of family l to focus attention on the understanding of t of human growth and development.

The Need

Young people are growing up in a pluralistic, democratic society wherein many traditional cultural patterns and standards are being challenged. They need help and guidance in relation to current problems, issues, and sociocultural conditions related to sexual conduct and behavior.

Home and family living needs to be strengthened in our society. Teenage marriages have increased at a rapid rate, with three fourths of them breaking up. There is also an upward trend in the number of divorces granted for the population as a whole. *U.S. News and World Report* magazine states that "More than 7 million children under 18, or about 1 in 10, are being raised in fatherless homes."[1] The magazine goes on to report that, according to sociologists and psychiatrists, "Boys can suffer much emotional damage if there is no 'male model' on which to pattern themselves."[2]

Accurate information from reliable sources is necessary if children and youth are to successfully cope with the pressures of today's society. However, a national survey on school health education practices reported that "Questions about sex asked by fifth and sixth grade children in anonymous surveys reflect distorted facts and a need for accurate information."[3]

Every community has some type of a family life and sex education program, but it is the responsibility of concerned citizens to determine the quality of it.

Implementation

The public school must assert leadership in the community relative to implementing a comprehensive family life and sex education program. School boards, school administrators, and teachers need to become involved with parents, churches, and other community agencies

erica's 'Broken Homes.'" *U.S. News and World Report*, Vol. LVX, No. 6 (August 5, 1968), 92.

to gain support and acceptance of the program. However, the school cannot wait until all citizens are ready before inaugurating this necessary curricular development.

It is recommended that the board of education and superintendent initiate a family life and sex education program by organizing a citizens' committee composed of educators, clergymen, representatives of the medical field, members of the school board, and members of the P.T.A. All aspects of the program should be studied, including:

1. Community needs and attitudes (A poll or survey should be taken for future reference.)
2. Student needs and attitudes
3. Reference materials and curriculum guides available

One educator should be given authority and time to direct and coordinate this committee work. The committee should recommend an appropriate course of action to the board of education relative to curriculum development.

After the board of education has endorsed the program, the same committee or a separate committee of educators should develop a sequential and coordinated program (vertical and horizontal) for grades K-12, based upon these guidelines. A summer writing team will facilitate curriculum development. Emphasis should not only be given to the physiological aspects of sexuality, but to the psychological, sociological, and economic aspects as well. These curriculum experiences should be integrated into specific and appropriate courses at all grade levels. However, there is a need to consider the merits of a separate course on family living for 11th or 12th grade pupils with special emphasis on preparation for marriage, parenthood, and family life.

The nature of the program dictates that boys and girls be scheduled together as a general practice if it is to be most meaningful and effective and considered a part of the regular curriculum. However, occasionally it may be desirable to schedule boys and girls separately to discuss specific aspects of body cleanliness. Team teaching can provide for effective staff utilization in emphasizing the various aspects of the program.

The approach to implementing the program into the curriculum may vary in each school district. However, it is vital for parents to be involved if the school is to support and supplement the home. A district should give consideration to the approach that will enable it to establish a successful and meaningful program. The pilot teacher plan and district-wide plan are examples of implementation procedures.

Pilot Teacher Plan. Select teachers at each grade level who have a high level of interest, insight, understanding, empathy, and knowledge and who can help pupils develop healthy moral attitudes. These teachers will evaluate the program at the conclusion of the year and prepare a revised curriculum for implementation the second year. Inservice education is provided for all teachers.

District-Wide Plan. All teachers are urged to become involved in teaching family life and sex education. The recommended content is taught sometime during the school year. Inservice education is provided prior to beginning the program.

General Suggestions for Teachers

The instructor should at all times be strictly honest in all statements, ready to encourage and to answer all legitimate questions, and careful to distinguish fact from belief or interpretation.

The personality of the instructor, the manner in which he imparts information, and the degree of confidence which students have in him are as important as what he says in formulating the ideals of his students.

Controversial Issues

Certain areas of family life and sex education are controversial and need special precautions. These areas and precautions are as follows:

1. Sexual techniques should not be included in the program.
2. Sexual perversion should not be included as a major topic. However, it is desirable that appropriate instruction be given to protect children and youth against sexual deviates.
3. Birth control is a very sensitive area. Birth control methods may be discussed, but advocating types of birth control should not be included in the program. This is a responsibility of the parents and church.

Children and youth may express specific deviate behavior related to sexual behavior by either direct question or teacher observation. Teachers should refer these pupils to other specially trained personnel for followup work and consultation, rather than jeopardize the welfare of the particular pupil and of the rest of the class.

3413 A

3

Preservice Education

Teacher education institutions have an important role in the development of an effective family life and sex education program. The following levels of preparation are recommended.

1. All elementary and secondary school teachers should have at least a basic course in family life and sex education.
2. Special preparation for secondary school health, home economics, science, and social studies should consist of 9 credits in family life and sex education.
3. A family life educator should have at least a minor in family life. This educator could serve as a school district consultant.

Inservice Education

Inservice education is a continuing process. Parents, as well as teachers, can benefit from such a program. It would be desirable to have teachers enroll in at least one course or workshop in family life and sex education. However, if this is not feasible the following areas, suggested in the New Jersey *Guidelines for Developing School Programs in Sex Education,*[4] should be included in a local inservice program.

1. Need for the program
2. Concept of human sexuality
3. Psycho-sexual development
4. Reproduction
5. Relationships of heredity and environment
6. Preparation for marriage and the family
7. Special topics such as venereal disease, homosexuality, masturbation, and illegitimacy
8. Family life and sex education curriculum content and resources

Inservice education can be held during the preschool teacher workshop to introduce teachers to the program. Inservice institutes for one session per week are very desirable for factual information.

Assessing the

s to the program. Inservice institutes for one
desirable for factual information.

Assessing the Program

A cognitive appraisal of family life and sex education is a relatively common and comparatively simple process. However, this type of appraisal is important only to the degree that knowledge influences attitudes and behavior. The following criteria, suggested in the New Jersey guidelines,[8] will help the classroom teacher and parents to determine the effectiveness of an organized instructional program in family life and sex education regarding attitudes and behavior.

1. Extent of interpersonal relationships with peers
2. Extent of overt sexual behavior
3. Extent of covert sexual behavior
4. Choice of reading materials
5. Choice of free-time activities
6. Type of behavior in lavatories
7. Reaction to classroom discussion
8. Participation in discussions
9. Discretion employed in speech, dress, and behavior
10. Amount of self-discipline
11. Correct use of terminology
12. Responsibility to self and for others
13. Frequency of pornography brought into class
14. Incidence of toilet markings with obscene theme
15. Degree of respect for and cooperation with members of the opposite sex

Significant evaluation of the family life and sex education program may be possible only after the passing of many years when the effects of wholesome sexuality attitudes are reflected in the success of these students in rearing their own children.

Scope and Sequence for Grades K-12

The suggested content of the program is organized by grade levels, that is, primary, intermediate, junior high school, and senior high

g School Programs in Sex Education. New Jersey State Department of Education, 1967. pp. 14-16.

3414 A
3414

school. Flexibility has been allowed for school districts to determine the specific grades or subjects in which the content is to be emphasized.

Eight goals have been identified to focus emphasis on the many aspects of a comprehensive family life and sex education program. However, school districts may want to combine the content for certain goals into one unit of instruction. Certain goals may be emphasized more at one grade level than at another.

Reference Materials

Suggested reference materials have been listed for each grade level. The materials have been classified as printed resources (student books, professional books, charts, pamphlet
visual resources (filmstrips, transpare

sified as printed resources (student books, professional books, charts, pamphlets, and periodicals) and audio-visual resources (filmstrips, transparencies, films, models, and tapes).

The references for each grade level, located in the closing pages of that section, have been numbered so that referrals to specific materials can be made in the "Resources" column.

In the sections for primary grades and elementary grades, the numbers apply to all points listed in the "Learning Experiences" column under the particular goal. In the sections for junior high school and senior high school, the numbers refer only to specific points in the "Learning Experiences" column.

3415

3415 A

Suggested Long-Range Behavior Goals

The suggested teaching generalizations for each grade level are based upon the long-range behavior goals for family life and sex education. These goals are necessary if we are to know where we are going; otherwise, we are concerned chiefly with the short-range objectives. By the completion of the 12th grade, each individual to the limits of his capacity should:

1. Acquire a maturing self-image which enables the individual to live out his sexuality in a responsible and creative way as a male or female
2. Understand the nature and purpose of the family as the basic unit in society and the roles played by the family and its members
3. Demonstrate a pattern of relationships based upon insight and understanding of one's obligations and responsibilities to himself and others
4. Understand the influences on sexuality of political, philosophical, religious, and cultural ideologies including beliefs, customs, and laws in a pluralistic society
5. Develop and employ a personal code of ethics which recognizes that human values and beliefs vary among different groups and individuals within a pluralistic society
6. Accept a personal responsibility for positive and constructive influences on society's concerns for family living and sexuality
7. Employ suitable and effective communication about human sexuality in various situations and settings
8. Understand anatomical, physiological, psychological, and sociological maturation as related to human sexuality

Introduction

Philosophy

An increasingly complex society is making increasingly complex demands upon children and youth in family life and sex education. Our society has stimulated young people to reach an early superficial maturity. The blatant sex in society has its impact through mass media which contributes little to the development of desirable attitudes. This has caused a greater need for guidance and education to foster correct information and desirable attitudes, behavior, and values in human sexuality. The basic issue is not whether or not Minnesota children and youth should have family life and sex education — they will receive it one way or another. The basic issue is whether they receive it from their peer group, from the street, and from experience alone or whether they get it from the home, church, and school working cooperatively.

The dignity of the person requires that each individual receive an education in family life and sex education. Helping individuals attain maturity in human sexuality and to understand human sexuality is a privilege and responsibility of every age. Parents have the prime responsibility for the inculcation of moral values to their children, but the school needs to support and supplement the parents. One way to provide a more meaningful life experience is to provide school children with an opportunity to come to grips with the problems and issues inherent in family life and sexual behavior before they become problems to the individual and society and before the individual is faced with situations for which he is not equipped to make desirable and socially acceptable judgments.

Education for family life and sex education, in its broadest form, is concerned not only with physical relations but, more importantly, with emotional and social interrelationships. Within this context, these guidelines are provided as an initial step to strengthen instruction in wholesome attitudes and respect for all cultures in the area of family life and sex education and to focus attention on the understanding of the self within the context of human growth and development.

The Need

Young people are growing up in a pluralistic, democratic society wherein many traditional cultural patterns and standards are being challenged. They need help and guidance in relation to current problems, issues, and sociocultural conditions related to sexual conduct and behavior.

Home and family living needs to be strengthened in our society. Teenage marriages have increased at a rapid rate, with three fourths of them breaking up. There is also an upward trend in the number of divorces granted for the population as a whole. *U.S. News and World Report* magazine states that "More than 7 million children under 18, or about 1 in 10, are being raised in fatherless homes."[1] The magazine goes on to report that, according to sociologists and psychiatrists, "Boys can suffer much emotional damage if there is no 'male model' on which to pattern themselves."[2]

Accurate information from reliable sources is necessary if children and youth are to successfully cope with the pressures of today's society. However, a national survey on school health education practices reported that "Questions about sex asked by fifth and sixth grade children in anonymous surveys reflect distorted facts and a need for accurate information."[3]

Every community has some type of a family life and sex education program, but it is the responsibility of concerned citizens to determine the quality of it.

Implementation

The public school must assert leadership in the community relative to implementing a comprehensive family life and sex education program. School boards, school administrators, and teachers need to become involved with parents, churches, and other community agencies

3412A

to gain support and acceptance of the program. However, the school cannot wait until all citizens are ready before inaugurating this necessary curricular development.

It is recommended that the board of education and superintendent initiate a family life and sex education program by organizing a citizens' committee composed of educators, clergymen, representatives of the medical field, members of the school board, and members of the P.T.A. All aspects of the program should be studied, including:

1. Community needs and attitudes (A poll or survey should be taken for future reference.)
2. Student needs and attitudes
3. Reference materials and curriculum guides available

One educator should be given authority and time to direct and coordinate this committee work. The committee should recommend an appropriate course of action to the board of education relative to curriculum development.

After the board of education has endorsed the program, the same committee or a separate committee of educators should develop a sequential and coordinated program (vertical and horizontal) for grades K-12, based upon these guidelines. A summer writing team will facilitate curriculum development. Emphasis should not only be given to the physiological aspects of sexuality, but to the psychological, sociological, and economic aspects as well. These curriculum experiences should be integrated into specific and appropriate courses at all grade levels. However, there is a need to consider the merits of a separate course on family living for 11th or 12th grade pupils with special emphasis on preparation for marriage, parenthood, and family life.

The nature of the program dictates that boys and girls be scheduled together as a general practice if it is to be most meaningful and effective and considered a part of the regular curriculum. However, occasionally it may be desirable to schedule boys and girls separately to discuss specific aspects of body cleanliness. Team teaching can provide for effective staff utilization in emphasizing the various aspects of the program.

The approach to implementing the program into the curriculum may vary in each school district. However, it is vital for parents to be involved if the school is to support and supplement the home. A district should give consideration to the approach that will enable it to establish a successful and meaningful program. The pilot teacher plan and district-wide plan are examples of implementation procedures.

Pilot Teacher Plan. Select teachers at each grade level who have a high level of interest, insight, understanding, empathy, and knowledge and who can help pupils develop healthy moral attitudes. These teachers will evaluate the program at the conclusion of the year and prepare a revised curriculum for implementation the second year. Inservice education is provided for all teachers.

District-Wide Plan. All teachers are urged to become involved in teaching family life and sex education. The recommended content is taught sometime during the school year. Inservice education is provided prior to beginning the program.

General Suggestions for Teachers

The instructor should at all times be strictly honest in all statements, ready to encourage and to answer all legitimate questions, and careful to distinguish fact from belief or interpretation.

The personality of the instructor, the manner in which he imparts information, and the degree of confidence which students have in him are as important as what he says in formulating the ideals of his students.

Controversial Issues

Certain areas of family life and sex education are controversial and need special precautions. These areas and precautions are as follows:

1. Sexual techniques should not be included in the program.
2. Sexual perversion should not be included as a major topic. However, it is desirable that appropriate instruction be given to protect children and youth against sexual deviates.
3. Birth control is a very sensitive area. Birth control methods may be discussed, but advocating types of birth control should not be included in the program. This is a responsibility of the parents and church.

Children and youth may express specific deviate behavior related to sexual behavior by either direct question or teacher observation. Teachers should refer these pupils to other specially trained personnel for followup work and consultation, rather than jeopardize the welfare of the particular pupil and of the rest of the class.

3413 A

Preservice Education

Teacher education institutions have an important role in the development of an effective family life and sex education program. The following levels of preparation are recommended.

1. All elementary and secondary school teachers should have at least a basic course in family life and sex education.
2. Special preparation for secondary school health, home economics, science, and social studies should consist of 9 credits in family life and sex education.
3. A family life educator should have at least a minor in family life. This educator could serve as a school district consultant.

Inservice Education

Inservice education is a continuing process. Parents, as well as teachers, can benefit from such a program. It would be desirable to have teachers enroll in at least one course or workshop in family life and sex education. However, if this is not feasible the following areas, suggested in the New Jersey *Guidelines for Developing School Programs in Sex Education,*[4] should be included in a local inservice program.

1. Need for the program
2. Concept of human sexuality
3. Psycho-sexual development
4. Reproduction
5. Relationships of heredity and environment
6. Preparation for marriage and the family
7. Special topics such as venereal disease, homosexuality, masturbation, and illegitimacy
8. Family life and sex education curriculum content and resources

Inservice education can be held during the preschool teacher workshop to introduce teachers to the program. Inservice institutes for one session per week are very desirable for factual information.

Assessing the Program

A cognitive appraisal of family life and sex education is a relatively common and comparatively simple process. However, this type of appraisal is important only to the degree that knowledge influences attitudes and behavior. The following criteria, suggested in the New Jersey guidelines,[5] will help the classroom teacher and parents to determine the effectiveness of an organized instructional program in family life and sex education regarding attitudes and behavior.

1. Extent of interpersonal relationships with peers
2. Extent of overt sexual behavior
3. Extent of covert sexual behavior
4. Choice of reading materials
5. Choice of free-time activities
6. Type of behavior in lavatories
7. Reaction to classroom discussion
8. Participation in discussions
9. Discretion employed in speech, dress, and behavior
10. Amount of self-discipline
11. Correct use of terminology
12. Responsibility to self and for others
13. Frequency of pornography brought into class
14. Incidence of toilet markings with obscene theme
15. Degree of respect for and cooperation with members of the opposite sex

Significant evaluation of the family life and sex education program may be possible only after the passing of many years when the effects of wholesome sexuality attitudes are reflected in the success of these students in rearing their own children.

Scope and Sequence for Grades K-12

The suggested content of the program is organized by grade levels, that is, primary, intermediate, junior high school, and senior high

in Sex Education. New Jersey State Department of Education, 1967. pp. 14-16.

3414 A

school. Flexibility has been allowed for school districts to determine the specific grades or subjects in which the content is to be emphasized.

Eight goals have been identified to focus emphasis on the many aspects of a comprehensive family life and sex education program. However, school districts may want to combine the content for certain goals into one unit of instruction. Certain goals may be emphasized more at one grade level than at another.

Reference Materials

Suggested reference materials have been listed for each grade level. The materials have been classified as printed resources (student books, professional books, ch
visual resources (films

l to focus emphasis on the many life and sex education program. to combine the content for certain Certain goals may be emphasized ther.

Materials

ve been listed for each grade level. printed resources (student books, professional books, charts, pamphlets, and periodicals) and audio-visual resources (filmstrips, transparencies, films, models, and tapes).

The references for each grade level, located in the closing pages of that section, have been numbered so that referrals to specific materials can be made in the "Resources" column.

In the sections for primary grades and elementary grades, the numbers apply to all points listed in the "Learning Experiences" column under the particular goal. In the sections for junior high school and senior high school, the numbers refer only to specific points in the "Learning Experiences" column.

Suggested Long-Range Behavior Goals

The suggested teaching generalizations for each grade level are based upon the long-range behavior goals for family life and sex education. These goals are necessary if we are to know where we are going; otherwise, we are concerned chiefly with the short-range objectives. By the completion of the 12th grade, each individual to the limits of his capacity should:

1. Acquire a maturing self-image which enables the individual to live out his sexuality in a responsible and creative way as a male or female
2. Understand the nature and purpose of the family as the basic unit in society and the roles played by the family and its members
3. Demonstrate a pattern of relationships based upon insight and understanding of one's obligations and responsibilities to himself and others
4. Understand the influences on sexuality of political, philosophical, religious, and cultural ideologies including beliefs, customs, and laws in a pluralistic society
5. Develop and employ a personal code of ethics which recognizes that human values and beliefs vary among different groups and individuals within a pluralistic society
6. Accept a personal responsibility for positive and constructive influences on society's concerns for family living and sexuality
7. Employ suitable and effective communication about human sexuality in various situations and settings
8. Understand anatomical, physiological, psychological, and sociological maturation as related to human sexuality

3416

Scope and Sequence for Family Life and Sex Education

PRIMARY GRADES

3418

Goal I: To acquire a maturing self-image which enables the individual to live out his s as a male or female

Concept A: Relationship of an individual's sexuality to his tal personality develop

GENERALIZATIONS	LEARNING EXPERIENCES	RESOU
1. Liking and accepting oneself as an individual is basic to the development of a healthy personality.	1. Discuss meaning of personality and traits.	PRINTED: 1, 8, 1 24a, 26a
2. Personality is influenced by one's sex.	2. Role-play activities which show a pleasant personality such as happiness, kindness, sense of humor, consideration for others, and sharing; and an unpleasant personality such as irritability, selfishness, unkindness, and poor manners.	AUDIO-VISUAL:
3. Boys and girls are similar and different physically, emotionally, socially, and mentally.	3. Have each child describe his strengths and ways he can improve himself.	
4. Each one has a unique personality which is shown by behavior and feelings.	4. Have each child write, discuss, or explain what he or she likes about being a boy or girl.	
5. Diversity must be respected, not just tolerated.	5. Explore different and similar behavior in sexes from the standpoint of interests, abilities, activities, and personality traits. Example: Boys who want to be like father learn the masculine role, and girls who want to be like mother learn the feminine role.	
6. Recognizing and improving strengths and overcoming shortcomings contribute to the development of a healthy personality.	6. Motivate children to select models whom they admire and would want to be like.	
7. One's self-image and feelings of self-worth result from the extent to which physical and emotional needs are met or unmet.	7. Demonstrate ways personality of boys and girls are different in manners, interests, and behavior.	
8. Expression of feelings or emotions can be constructive or destructive to self and others; feelings are expressed by action and words; feelings help one learn about oneself.	8. Discuss basic needs such as security, love, and the need to belong. Have children describe ways these needs are met and how the meeting of these needs helps one develop respect for oneself and others.	

3417
3418

ıring self-image which enables the individual to live out his sexuality in a responsible and creative way
e

of an individual's sexuality to his total personality development

LEARNING EXPERIENCES	RESOURCES	EVALUATION
1. Discuss meaning of personality and traits.	PRINTED: 1, 8, 13, 14, 20, 22, 24a, 26a	1. Observe improvement in behavior of children as they gain more understanding of the reasons for treating others and self with respect and consideration.
2. Role-play activities which show a pleasant personality such as happiness, kindness, sense of humor, consideration for others, and sharing; and an unpleasant personality such as irritability, selfishness, unkindness, and poor manners.	AUDIO-VISUAL: 3, 4a	2. Observe improvements in vocabulary.
3. Have each child describe his strengths and ways he can improve himself.		3. Check on children's understanding of likes and differences of boys and girls in terms of roles in life, interests, and activities.
4. Have each child write, discuss, or explain what he or she likes about being a boy or girl.		4. Realizes that each one can choose activities which appeal to his interests.
5. Explore different and similar behavior in sexes from the standpoint of interests, abilities, activities, and personality traits. Example: Boys who want to be like father learn the masculine role, and girls who want to be like mother learn the feminine role.		5. Note type of models children choose.
6. Motivate children to select models whom they admire and would want to be like.		6. Shows growth in use of proper manners.
7. Demonstrate ways personality of boys and girls are different in manners, interests, and behavior.		7. Realizes that there are activities which boys like to do with boys and girls with girls, as well as activities boys and girls enjoy together.
8. Discuss basic needs such as security, love, and the need to belong. Have children describe ways these needs are met and how the meeting of these needs helps one develop respect for oneself and others.		8. Note improvement in children in feelings of self-worth and trust as certain basic needs are met.

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
9. Living healthfully and maintaining body cleanliness help one feel good.	9. Ask children to tell how behavior of boys and girls is learned.	
10. It is normal to be curious about sexual differences.		
11. Modesty in act, speech, or dress is behaving according to what is proper and acceptable in our society.		

Goal II: To understand the nature and purpose of the family as the basic unit in society a its members

Concept B: Family's role in human sexuality

1. The family is the basic unit in our society.	1. Discuss what a family is, how it begins, and how it maintains itself as a family unit.	PRINTED: 2, 7, 9, 17, 2
2. A group of persons living in the household is a family.	2. Have children draw pictures of various families, noting that there are many kinds of families such as one parent, two parents, large and small, adoptions, stepfather and stepmother, and foster parents. Bring out positive aspects of each kind of family.	AUDIO-VISUAL: 1a, 3,
3. Families differ and there are many kinds of families.	3. Have each child develop a family tree of the immediate social family. (Not necessarily genetic. Use good judgment in using this experience.)	
4. Most families include a man and woman who marry, love each other, and want and have children. (Teacher has to be sensitive to student needs.)	4. Develop and use "All About Me" data sheet.	
5. A child identifies with the parent's role he would like to take, ie., boy wants to be like father's image, girl wants to be like mother's image.	5. Draw pictures and explain how one's responsibility in the family changes as one grows older.	

3420
3419

EARNING EXPERIENCES	RESOURCES	EVALUATION
x children to tell how behavior of s and girls is learned.		9. Observe willingness of children to try tasks again and again until some satisfaction has been achieved. 10. Awareness that masculine and feminine behavior is copied or imitated from those the person is with the most or admires.

Accepts authority of parents or guardians by obeying rules and accepting standards. 4. Growth in realizing function and purpose of the family. 5. Realizes how the family prepares for, cares for, loves, and wants the new baby. 6. Recognizes that discipline and respect are important factors in family living.

3419 A

GENERALIZATIONS	LEARNING EXPERIENCES	RESOUR
6. Family living can prepare one for life in a democratic society, each one expressing his point of view but abiding by rules and respect for authority.	6. Dramatize roles of various family members.	
7. Each member of the family is an important, contributing member with various roles and responsibilities, including the world of work.	7. Invite mothers with newborn babies to visit the classroom to discuss baby care.	
8. Parents or guardians are responsible for the health and well-being of family members.	8. Have children draw pictures of ways they can help at home and what parents do for their children.	
9. Love, security, companionship, and protection are provided to most children by their family.	9. Discuss the meaning of love within the family and ways it is shown by parents and children.	
10. Children are dependent upon parents or guardians for a long period of time.	10. Have children discuss what they know about feminine and masculine behavior. Explore the sources of influences. Review merits of being a boy or girl.	
11. Parents or guardians should expect certain things from their children and children, in turn, should expect certain things from their parents or guardians.	11. Read stories about various kinds of families; help children realize that every family has happy times, sad times, quarrels, and problems to face and solve. Stress the importance of all working together and that each one doing his part makes for a better family.	
12. There are many kinds of love such as maternal, paternal, and sibling.	12. Study ways of planning for the arrival of a baby and how it is cared for after birth. Have children tell ways they help at home. Use film or draw pictures which show ways children help.	
13. One needs to realize that the development of one's talents during school years is important for preparation for the world of work.	13. Discuss health care of the mother; why the mother goes to the hospital to have the baby.	
	14. Review and explain meaning of love, particularly maternal, paternal, and sibling love. Have children tell ways that love is shown in the family and what they do to show love to their parents, brothers, and sisters. Read

13. Enjoyment of solitary and group activities, as well as receiving satisfaction from creative and original activities, is normal.	or sex molesting.) Motivate children to discuss standards of behavior with parents or guardians. From this discussion, summarize qualities of a good friend. Plan a discussion around the questions: a. Can we tell a good friend by appearance? b. How are you going to select your friends? c. How are you going to behave toward false friends and strangers? 12. Encourage children to report unusual situations to parents or teacher. Example: advances of older children, friends, or strangers to participate in sexual activities or improper conduct. 13. Establish rules and guidelines for selecting good friends and avoiding false friends and dangerous strangers. 14. Role-play ways by which children can help others. 15. Develop good grooming standards; dramatize importance of neatness and cleanliness in being pleasing to others. (Avoid embarrassment of children and stress things everyone can do regardless of individual differences and circumstances.) 16. Ask children to complete sentences or tape-record answers to the following: Happiness is _____ I feel good when_____ A good friend is _____ I wish_____	

4524

3423

3423

Goal IV: To understand the influences on sexuality of political, philosophical, re
liefs, customs, and laws in a pluralistic society

Concept D: Factors affecting society's values on sexuality

GENERALIZATIONS	LEARNING EXPERIENCES	RES
1. In our society, families with similar and different religious beliefs, ways of behaving, customs, resources, standards, and values can get along together.	1. Review the meaning of a family and various kinds of families. Help children understand the meaning of "uniqueness" and "differences" and "similarities" when describing a family. Ask each child to write a paragraph about the customs and beliefs of his family in connection with rules and regulations within his family. Summarize and discuss similarities and differences. Have children discuss the questions: "How do children from families with different beliefs learn to get along together?" "What is the meaning of respecting rights of self and others?"	
2. The kind of behavior learned in the family affects the way one behaves in the school and community.	2. Role-play ways to maintain own standards of behavior and resist pressure from others.	
3. Boys and girls usually desire to adopt patterns and behavior in keeping with their sex role in the culture.	3. Dramatize how behavior learned at home helps one get along well in school and community. Example: responsibility, tolerance, respect for self and others, courtesy, modesty, and behavior in classroom and in public.	
4. The family, school, community, and nation have rules and standards which help to guide and to direct individual behavior.	4. Discussion Questions: "How is family living similar to and different from school and community living?" (Example: responsibility and authority.) "Does freedom mean to do as you please?" "What does responsibility mean?"	
5. Changes in the pattern for family life have increased.	5. Compare present-day family living to that of the pioneers. Project living into the future.	
6. Families who are not able to properly provide for children's needs sometimes need assistance.		
7. People in various parts of the world have different manners, ways of dressing, responsibilities to the family, sex roles, amounts of freedom, and language.

LEARNING EXPERIENCES	RESOURCES	EVALUATION
1. Review the meaning of a family and various kinds of families. Help children understand the meaning of "uniqueness" and "differences" and "similarities" when describing a family. Ask each child to write a paragraph about the customs and beliefs of his family in connection with rules and regulations within his family. Summarize and discuss similarities and differences. Have children discuss the questions: "How do children from families with different beliefs learn to get along together?" "What is the meaning of respecting rights of self and others?"		1. Accepts rights of others in our society to believe and behave differently.
2. Role-play ways to maintain own standards of behavior and resist pressure from others.		2. Shows growth in tolerance and understanding of others.
3. Dramatize how behavior learned at home helps one get along well in school and community. Example: responsibility, tolerance, respect for self and others, courtesy, modesty, and behavior in classroom and in public.		3. Acceptance of guidance and authority of trustworthy personnel in school and community.
4. Discussion Questions: "How is family living similar to and different from school and community living?" (Example: responsibility and authority.) "Does freedom mean to do as you please?" "What does responsibility mean?"		4. Awareness of the many ways families are helped by community agencies.
5. Compare present-day family living to that of the pioneers. Project living into the future.		5. Awareness of the different behavior of boys and girls in other countries.
		6. Understands that most family, school, and community rules protect one's health and safety and should be obeyed.
		7. Has ability to express feelings about differences in customs of families and is able to participate in arriving at reasonable decisions when suitable.

3424 A

3424
3424

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
8. Behavior of boys and girls is acquired from what their family, community, and nation expect of them.	6. Investigate community helpers (such as welfare and health) and how they help families in need. 7. Explore meaning of customs; compare dress, manners, and activities of boys and girls in this country to those of other countries. 8. Read stories about families of the world; compare the various family customs and the sex roles of members of other families with those of the American family.	

Goal V: To develop and employ a personal code of ethics which recognizes that human values a groups and individuals within a pluralistic society

Concept E: A code of sexual behavior as part of a total value system

1. Each one can develop controls to guide his behavior in order to avoid hurting others or getting into trouble. 2. Each one has acquired a set of values which may be similar and different from those of others. 3. Respect for rules of behavior is basic to the success of cooperative group work. 4. Development of a set of positive values helps one make wise choices and helps to establish standards which influence them. 5. Moral values of societies and families differ according to what is considered "right or wrong" by each one.	1. Discuss the meaning of values, judgment, and choices of behavior controls. Encourage children to give examples of actions or objects they value and why. 2. Provide reading which helps children to select good models from which to pattern behavior and acquire values. 3. Creative Writing or Taped Discussion: "How Do I Know Right from Wrong?" (Teacher needs to use judgment in discussing information.) 4. Establish controls to guide behavior so as not to hurt others. 5. Role-play: "Making Sound Choices in Various Situations." 6. Discuss importance of getting help in making behavior choices. 7. Examine ways our values show respect for ourselves and others.	PRINTED: 4, 13, 18, 19 AUDIO-VISUAL: 3, 4a

esponsibility for positive and constructive influences on society's concerns for family living and		
n and group responsibility regarding family living		
1. Include correct vocabulary that is necessary.	PRINTED: 2, 3, 7, 8, 10, 17, 28a	1. Note improved vocabulary.
2. Explain proper manners and actions in the lavatory. Examples: allowing for privacy, flushing the toilet, reason for different positions of boys and girls when urinating, leaving the toilet clean and neat, and washing hands.	AUDIO-VISUAL: 1a, 1b, 4a, 6b	2. Observe use of correct toilet manners and behavior.
3. Develop a proper set of guidelines for bathroom procedures from standpoint of health, modesty, privacy, and proper conduct. Include proper vocabulary.		3. Observe number of children who ask for help with problems, fears, and questions regarding sexuality.
4. Tour the school building, including the boys' and girls' lavatories.		4. Observe increased individual responsibility for keeping lavatories clean and neat.

3426

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
5. Each individual should contribute and be responsible to family, school, and community living.	5. Discuss importance of proper bathroom practices to the welfare of self and to others.	
6. Teamwork contributes to a pleasant, healthy environment.	6. Provide opportunities for children to talk freely with parents, teacher, and policemen.	
7. Each one has a desire for and a right to privacy in certain situations and at certain times.	7. Invite doctor or nurse to discuss ways to prevent spread of diseases by following proper personal habits, including toilet habits.	
	8. Discussion Topics: a. Ways to set good examples in actions, manners, speech, and appearance. b. Examples of what could happen when poor examples are set.	
	9. Discuss various safety rules in games, traffic, and fire prevention. Compare these with importance of safety in personal conduct such as walking on lighted streets.	
	10. Point out that obedience to safety rules shows that children are becoming people who can direct and be responsible for their own behavior.	
	11. Examine ways children can help with health and safety activities in the home.	
	12. Discuss each one's responsibilities for correct behavior in the school and in public buildings.	
	13. Construct murals of children working together.	
	14. Dramatize ways to take more responsibility for one's health and safety.

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
	Teacher Information The following special safety rules for children, taken from the book *Personal Safety and Defense for Women,* should be emphasized.[1] 1. Never take a ride with a stranger in the family car or any strange car even if he tells you your parents want you, or that your brother asked him to give you a ride home. 2. Always take a friend with you if you are selling candy, cookies, magazine subscriptions, Christmas cards, or any other items. 3. Never play in or near public restrooms, in theaters, alleys, empty buildings, or any lonely or isolated places. 4. Never go to a movie theater alone. If anyone tries to touch you, get out of your seat immediately. Tell the usher or the man in charge of the theater. Never go with such a person to the bathroom or for a ride. 5. If a stranger asks you for directions, keep your distance; and under no circumstances should you enter the car. 6. Never accept candy, ice cream, or any other items from a stranger, no matter how friendly or insistent. 7. Never go into the house or room of a stranger or casual acquaintance even if he tells you that he has something pretty or nice to give or show you. 8. If someone does try to get you or your playmate into a strange automobile, write down the license number by scratching it on the ground with a stick if you do not have a pencil or paper. Tell your parents and the police immediately. 9. Never take shortcuts that go through alleys, long dark streets, or empty lots where trees, low bushes, or tall grass are growing. 10. Never allow anyone, including friends or relatives, to touch or fondle intimate parts of your body. If someone tries to caress your body, whether you know them or not run as quickly as you can and inform your parents and the police.

Goal VII: To employ suitable and effective communication about human sexuality in vari

Concept G: Effective communication

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. Use of the correct terms for body functions and parts is proper; one should not be sensitive to using them. 2. Correct terms for various body functions and parts show respect for self and others. 3. Feelings and attitudes are shown toward others by actions, facial expressions, and treatment, as well as with words. 4. Respect for one another is shown by manners, words, and actions.	Note: It is recommended that the development of a proper vocabulary should be a part of the specific learning experience to which the words pertain rather than an isolated and separate skill. Providing an atmosphere where children can talk openly about their feelings and concern is important. 1. Help pupils build a basic scientific and acceptable vocabulary for level concerned. 2. Avoid embarrassing or shaming child who uses improper terms for body functions and parts. Anticipate this by helping children learn proper words early in their school experience. Examples: lavatory, bathroom, or toilet; bowel movement and urinate. 3. Dramatize how manners and actions toward others communicate feelings and respect. 4. Role-play a given situation without use of words. Have children explain the situation with words. Summarize the many meanings of communication.	AUDIO-VISUAL: 3, 4a

Goal VIII: To understand anatomical, physiological, psychological, and sociological matu

Concept H: Human growth and development

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. All living things reproduce; life comes from life, and like produces like. 2. New life (and how new life begins) is a wonder. 3. There are similarities and differences in animal and human reproduction and care of the young. 4. Respect for oneself and others as human beings is important. 5. Rate of growth is different for each one, but all go through the same stages. 6. Growth is physical, mental, emotional, social, and moral. 7. Each one is unique. 8. There are both sexual differences and similarities between boys and girls. 9. Elementary anatomy and physiology of the reproductive and urinary systems should be understood. 10. The genitals are sensitive areas of the body.	1. Develop vocabulary as needed. 2. Study process of reproduction of plant and animal life. Conduct experiments with growth of various kinds of seeds, demonstrating that the new or baby plants are like the plant which produced them. Explain the importance for all living things to reproduce themselves. Introduce meaning of cell and cell growth. 3. Explain that it is necessary for humans and higher animals to have a mother and a father to begin life; this includes the human baby. 4. Examine various ways animals produce their young. Examples: hatching, being born alive. Relate to human baby, using film, filmstrip, and stories. 5. Impress upon the children the wonder of new life as one of nature's greatest miracles. 6. Examine the similarities and differences between animal and human reproduction. Use a film, filmstrip, or pictures. 7. Present in brief, simple manner how the human baby grows inside the mother, is born, and is cared for. Use transparencies and pictures. 8. Use transparencies, charts, or books to present an elementary introduction to the reproductive and urinary systems, including the sexual differences of boys and girls and the	PRINTED: 1, 2, 3, 4, 5 14, 15, 16, 17, 20, 21, 23, 24a, 25a, 26a, 26b AUDIO-VISUAL: 2a, 3 5a, 5b, 6d

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES	EVALUATION
	care and safety of external genitals. Impress children with the fact that kicking or striking a person's genitalia can cause injury.		
	9. Discuss the reasons why one should accept and understand parts of the body, but that certain parts of the body are private and kept covered in our society.		
	10. Examine the meaning of physical, mental, emotional, social, and moral growth. Ask each child to show or tell how he has grown in each area. Example: measuring height and weight, making decisions, acquiring new learning, getting along with one another. Use visual aids, role-playing, dramatization, creative writing, and auditory aids.		
	11. Make a time-line depicting growth. Review life cycles of growth; study about the present stage and briefly examine the stage children will soon be entering.		
	12. Help each child understand his uniqueness and his individual differences and the effect of heredity and environment on his growth. Impress upon each child that each member of the class looks and is different.		
	Teacher Information		
	1. Note children who handle and fondle their genitalia. Avoid making a child feel guilty or ashamed. Redirect activity and secure help from qualified personnel if behavior persists.		

3431

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES	EVALUATION
	2. Emphasize that children should avoid allowing others to touch or fondle parts of body such as the genitalia, also they should avoid touching private parts of another person's body.		
	3. Fondling and touching the genitalia bring satisfaction and enjoyment; such sensations are a natural characteristic of the physiological and psychological makeup of individuals.		
	4. Individuals can learn to control and to redirect sexual desires and drives such as sex play and infantile masturbation.		
	5. Habitual handling or fondling of the genitalia can be a symptom of a problem or lead to undesirable habits.

Scope and Sequence for
Family Life and Sex Education

INTERMEDIATE GRADES

3437

3436

Goal I: To acquire a maturing self-image which enables the individual to live out his sexualit as a male or female

Concept A: Relationship of an individual's sexuality to his total personality development

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. Personality is expressed by one's self-image. 2. Actions and reactions in various situations show one's self-image or feelings of self-worth just as seeing oneself in a mirror reflects stature and appearance. 3. The self-image is strengthened or weakened by the way one is treated or accepted by others and to the extent basic physical and emotional needs are met. 4. Grooming, manners, dress, the expression of one's sexuality, and feelings about one's sex role reveal personality and security. 5. Diversity must be respected, not just tolerated. 6. Growth in recognizing one's strengths and weaknesses is a sign of maturity. 7. Interests change as one grows and matures. 8. Each individual has a responsibility to perform to his maximum potential as he grows and matures.	1. Develop meaning of the "self-image." How can the comparison be made with seeing oneself in a mirror? 2. Ask pupils to write a paper on what they like about themselves and how they feel they can improve. 3. Creative Writing: "What Is It Like To Be a Boy or a Girl?" 4. Role-play various personality traits and observe effect on others. 5. Discuss why it is necessary to like and respect oneself before one can respect and like others. 6. Explore factors that affect personality. 7. Interview Using Tape Recorder: "The Kind of Person I Want To Become." 8. List desirable personality traits. Select a hero or model who shows these traits. 9. Help pupils to understand that each one is unique and to accept individual differences. 10. Review the basic physical and emotional needs and how these needs affect the individual when they are met or unmet. 11. Study basic principles of good mental health.	PRINTED: 1, 5, 10c, 12 13a, 14a AUDIO-VISUAL: 1b, 3, 5a 6g

3436

PRINTED: 1, 5, 10c, 12a, 13a, 14a AUDIO-VISUAL: 1b, 3, 5a, 6g	1. Understands the meaning of self-image. 2. Demonstrates an awareness of strengths and ways to improve one's personality. 3. Gains insight into need for long-range goals. 4. Demonstrates confidence and trust in oneself. 5. Acquires an understanding of good mental health practices. 6. Demonstrates an awareness of sexual differences and similarities. 7. Realizes that the range of choices of activities for either sex is based upon individual choice, work, and to some extent on one's sex. 8. Uses sources of help in solving personality and health problems. 9. Shows respect for and acceptance of others.

3437 A

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
9. Each individual experiences "ups" and "downs" in life and makes mistakes; these experiences are reflected in one's personality pattern.	12. Plan ways to help individuals develop a good self-image as well as respect for and trust in self and others.	
10. There are constructive and destructive ways of expressing emotions.	13. Panel Discussion: "How Feelings and Expressions of One's Sexuality Are Similar and Different in Boys and Girls."	
11. Self-respect and respect for others are demonstrated in choice of behavior.	14. Establish standards for acceptable behavior and manner for each sex.	
12. The manner in which one deals with sexual drives and feelings can have a positive or negative effect on one's personality.	15. Panel Discussion: "What Are Activities That Only Boys Can Do and Only Girls Can Do and 'Why'?" "Is a Boy a 'Sissy' If He Likes To Do Some 'So Called' Feminine Activities?" "Is a Girl a 'Tom Boy' If She Likes To Do Some Masculine Activities?" Summarize the discussion by basing selection of activities on individual interests, abilities, and likes and differences and by suggesting that masculine and feminine behavior is copied and learned to a great extent from peers and adults.	
13. Acceptance of one's sexuality and sensitivity to the sexual behavior of the other sex is important.		
14. Masculine and feminine behavior is expressed in relationship to one's sex.		

Goal II: To understand the nature and purpose of the family as the basic unit in society and its members

Concept B: Family's role in human sexuality

1. Family members are important and have a potential contribution to the well-being of the whole family.	1. Write a paragraph on "How I See Myself as an Important and Contributing Member of My Family."	PRINTED: 1 AUDIO-VISUAL: 2a, 3, 4a
2. Family membership involves responsibilities and privileges.	2. Explain the various stages of the life cycle, indicating role and responsibility in each stage.	

3438

4. Family functions and roles are different.	4. Discuss family celebrations and customs and describe how they help in developing and maintaining family unity.	
5. Family celebrations, customs, and traditions contribute to developing family loyalty and unity.	5. Creative Writing: "How Members of My Family Help Me and How I Help Them."	
6. The family influences individual members and the individual member influences the family.	6. Panel: "How Families Are Alike and Different." (Recall that a family is a group of people living in the same house.) Note: Use judgment in planning and presenting this topic.	
7. Masculinity and femininity characteristics, traits, and sexual role are learned primarily in the home.	7. Discuss the many ways the family meets basic needs of the members such as security, belonging, providing love, trust, and protection. Explain reasons why some families can do this better than others.	
8. The family meets basic needs of members in many ways; some families do this better than others.	8. Analyze need for authority, discipline, and respect within the family.	
9. Discipline and authority should be provided within the family.	9. Invite resource person to discuss responsibilities for child care for this age level.	
10. Family members resemble one another, yet each one is different.		
11. Older family members have a responsibility for younger family members.		
12. Creating a life is a privilege of a husband and wife.		

3439* 3438

LEARNING EXPERIENCES	RESOURCES	EVALUATION
3. Role-play: (a) Setting examples of good behavior. (b) Ways to solve individual and group problems. (c) How to get along with brothers and sisters within the family group.		4. Understands that families differ in many ways.
4. Discuss family celebrations and customs and describe how they help in developing and maintaining family unity.		5. Appreciates individual differences of family members and differences of their family unit as compared to others in society.
5. Creative Writing: "How Members of My Family Help Me and How I Help Them."		6. Realizes that masculine and feminine behavior is learned from various sources.
6. Panel: "How Families Are Alike and Different." (Recall that a family is a group of people living in the same house.) *Note: Use judgment in* planning and presenting this topic.		7. Accepts family authority and discipline and sees value in cooperating and getting along with others.
7. Discuss the many ways the family meets basic needs of the members such as security, belonging, providing love, trust, and protection. Explain reasons why some families can do this better than others.		8. Demonstrates a willingness to assist with care of young children in the home.
8. Analyze need for authority, discipline, and respect within the family.		
9. Invite resource person to discuss responsibilities for child care for this age level.		

3439 A

Goal III: To demonstrate a pattern of relationships based upon insight and understanding of c
to himself and others

Concept C: Effective interpersonal relations

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. One's behavior has an effect on others.	1. Role-play: Group problem solving, including examples of cooperation and respect for rights of others.	PRINTED: 1, 4 AUDIO-VISUAL: 1b, 4a
2. Rights of others need to be recognized.	2. Have each pupil keep a record for a period of time, reporting things he has done to help others or make others feel happier and also recording what others have done for him. Summarize, without personalizing reports, how this type of behavior affects in a positive way. Contrast this to negative behavior.	
3. Accepting responsibility for one's behavior and control of one's impulses and feelings should improve with maturity.	3. List types of activities that boys and girls can enjoy together.	
4. One cannot always have his own way.	4. Dramatize and role-play courtesy and manners which boys should show toward girls, girls toward boys, young people toward adults, and young people toward each other.	
5. Selection of wholesome leisure-time activities is important.	5. Discuss: (a) Characteristics that make you want to know a person. (b) Different kinds of friends. (c) How friends increase and change as one grows older and interests change.	
6. Adhering to social customs helps people feel comfortable with one another.	6. Role-play or dramatize how actions can set a good or poor example.	
7. Just as one's friends can be good or false, each person can be a good or false friend.	7. Discuss why individuals react differently to others.	
8. Practices followed and habits formed can be helpful or harmful to self and others.	8. Study ways of rejecting others' actions which are against one's principles. Discuss how to say "no."	
9. Family life contributes to helping one learn to get along with others.	9. Review reasons for avoiding invitations of friendly strangers.	
10. There are many kinds of love and definitions of love.		
11. Wholesome boy-girl relationships contribute to social adjustment.

Shows evidence of growth in use of correct vocabulary. 2. Realizes that feelings toward self and others can be expressed in many ways. 3. Realizes that one must evaluate information received from mass media and other sources.

Goal VIII: To understand anatomical, physiological, psychological, and sociological maturat

Concept H: Human growth and development

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. Growth is physical, emotional, social, mental, and ethical. 2. Adolescence is the period of growth from childhood to maturity. 3. Each person is unique and different, but all go through the same stages of growth from childhood to adulthood according to individual growth patterns. 4. Creation of new life is one of nature's greatest miracles. 5. Heredity and environment determine to a great extent what a person becomes; individual goals and wants are also important factors. 6. Heredity refers to those personal characteristics that have been passed on to an individual from his parents through chromosomes and genes. 7. Growth of the human baby inside its mother, process of birth, and care of mother and child should be understood. 8. Heredity, chance, and certain medications are factors influencing multiple births.	1. Utilize various techniques to demonstrate physical, mental, emotional, and ethical growth. These could include a review of individual growth patterns or use of growth charts and other evidence regarding maturation in each aspect of growth. 2. Study individual differences in terms of growth stages. Stress physical growth changes and secondary sex characteristics during puberty. 3. Discuss the fact that scientists have not created or manufactured any sort of complex life organisms from something that is not living. (Review previous study about life comes from life, and like produces like). 4. Examine the inherited traits and characteristics and the effect of environment on one's development. Summarize the importance of realistic goals for oneself. Assign committees to investigate and report on each topic. Examine the similarities and differences in plant, animal, and human reproduction. 5. Have each pupil make a list of his inherited characteristics such as color of eyes and color of hair. Trace characteristics as far back through his parents as possible; include parents, brothers, sisters, cousins, aunts, uncles, and grandparents.	PRINTED: 2, 3, 5, 6, 7, 8 10a, 10b, 11, 12a, 13a, AUDIO-VISUAL: 1a, 2a, 6a, 6e, 6f, 6g, 6h, 7a, 8a

Study individual differences in terms of growth stages. Stress physical growth changes and secondary sex characteristics during puberty. Discuss the fact that scientists have not created or manufactured any sort of complex life organisms from something that is not living. (Review previous study about life comes from life, and like produces like). Examine the inherited traits and characteristics and the effect of environment on one's development. Summarize the importance of realistic goals for oneself. Assign committees to investigate and report on each topic. Examine the similarities and differences in plant, animal, and human reproduction. Have each pupil make a list of his inherited characteristics such as color of eyes and color of hair. Trace characteristics as far back through his parents as possible; include parents, brothers, sisters, cousins, aunts, uncles, and grandparents.	PRINTED: 2, 3, 5, 6, 7, 8, 9a, 10a, 10b, 11, 12a, 13a, 14b AUDIO-VISUAL: 1a, 2a, 3, 6a, 6e, 6f, 6g, 6h, 7a, 8a	1. Realizes that there is a relationship between all aspects of growth; however, one aspect may be dominant at a certain stage such as the physical aspect during puberty. 2. Recognizes that each one is unique and grows at a different rate. 3. Increased appreciation of the wonder and beauty of new life. 4. Awareness of role of heredity, environment, and goals in shaping one's growth and development. 5. Realization that one's sex is determined when ovum is fertilized; most masculine and feminine behavior is learned from one's environment. 6. Understands the anatomy and physiology of the reproductive systems of the male and female. 7. Realizes signs of puberty in self and understands their meaning. 8. Understands importance of controlling and directing one's sex drive in a wholesome manner, as well as with other feelings.

3446 A

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES	EVALUATIO
9. Maleness and femaleness refer to the sex one is born; masculinity and feminity refer to sexual behavior learned from the environment, including culture and customs.	6. Study growth and development of the human baby, including cell division and cell differentiation.		
10. Each one's makeup contains some male and female characteristics.	7. Secure pupil description of masculine and feminine behavior. How do these relate to being male and being a female?		
11. The reproductive system of the boy and that of the girl are different and complementary in terms of functions and organs.	8. Study the anatomy and physiology of the human reproductive system of the male and the female. Use visual aids such as films and filmstrips. Impress children with the fact that kicking or striking a person's genitals can cause injury.		
12. Puberty marks the end of childhood and the beginning of youth; it is that stage of physical development when it is first possible to create human life.	9. Discuss management of sexual drives which requires self-worth and a consideration for rights of others.		
13. Secretions from the glands of the endocrine system cause to a great degree the growth changes during puberty, including the sex drive.	10. Explain that the presence of sexual desires and feelings, menstruation, and seminal emissions are signs of puberty. Use visual aids, reading materials, and discussion to aid pupils in securing an understanding of the sex drive, its purpose in creating new life, the purpose of menstruation, and the meaning of seminal emissions. (Note: Use judgment in discussing human mating or intercourse; develop proper vocabulary.)		
14. The sex drive is a normal and natural part of each one's makeup.	11. Review and expand study of emotions and how they affect behavior.		
15. Life of human beings and animals begins with the union of two cells, the sperm cell from the male and the ovum or egg cell from the female; this union is called fertilization.	12. Review importance of personal hygiene, cleanliness of wearing apparel, and use of deodorants.		
	13. Explain the meaning of masturbation in a nonjudgmental manner. Note: Check with local school policy as to procedures and extent of teaching at this level.		

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES	EVALUATIO
16. The genitals are sensitive areas of the body; therefore, sexual feelings and sensations are aroused by touch, actions, pictures, speech, and the like. Such sensations are a natural characteristic of the physiological and psychological makeup of individuals.	14. Ask resource person (physician or physical education teacher) to explain ways to prevent injury to the genitals of boys and to breasts of girls.		
17. The genitalia and other sensitive parts of one's body need protection.	**Teacher Information** According to most medical authorities, masturbation does not cause physical or physiological harm but often causes mental and emotional concerns or guilt feelings, depending upon one's beliefs. However, deliberate or compulsive masturbation can be a symptom of a problem or lead to an undesirable habit.		
18. Emotions are natural human feelings which affect body functions and human behavior, including the sex drive.			
19. Personal hygiene should be practiced.

Scope and Sequence for Family Life and Sex Education

JUNIOR HIGH SCHOOL

3452

Goal I: To acquire a maturing self-image which enables the individual to live out
way as a male or female

Concept A: Relationship of an individual's sexuality to his total personality develop

GENERALIZATIONS	LEARNING EXPERIENCES	RESO
1. One's self-identity may be different from one's self-image and one's reputation.	1. Review the meaning of personality and how one's sexuality affects personality.	PRINTED: 4, 2 AUDIO-VISUA
2. Signs of growth toward independence and maturity are recognizing and controlling one's feelings, making wise choices, accepting consequences of behavior, having ability to carry increased responsibility, and using good judgment.	2. Develop a personality check list.	
3. Respect for oneself and liking oneself are important in developing a good self-image.	3. Discuss importance of establishing one's identity.	
4. The self-image may be improved or injured to the extent one's sexuality is recognized by the other sex.	4. Creative Writing: "Who Am I?" (A short autobiography about self-identification. Information to be kept in confidence by teacher.) Utilize this technique to help pupils understand the importance of self-discovery in answering the question "Who Am I?"	
5. Physical and mental health contribute to personal attractiveness and a pleasant personality.	5. Show the film *How Are You?* and discuss.	AUDIO-VISUA
6. Sexuality is an integral part of one's personality; acceptance of one's sex and sexual role is essential to health and well-being.	6. Role-play the actions of an immature and a mature person in given situations.	
7. Interest and curiosity about sex are normal.	7. Plan a panel discussion on the importance of physical fitness, proper health practices, good grooming, and sound human relationships to the development of a wholesome personality.	PRINTED: 21
	8. Panel Discussion: "What Is Meant by the Self-Image (as you see yourself), Self-Identity (as you really are), and Popularity (as others see you)?" "What Characteristics Make a Person Liked and Respected?" "Does Physical Beauty in a Girl and Strong Physique in a Boy Assure Popularity?"	

3453

g self-image which enables the individual to live out his sexuality in a responsible and creative ıale

n individual's sexuality to his total personality development

LEARNING EXPERIENCES	RESOURCES	EVALUATION
1. Review the meaning of personality and how one's sexuality affects personality.	PRINTED: 4, 20a, 25a AUDIO-VISUAL: 3b, 3c	1. Demonstrates interest and desire in learning about and improving oneself.
2. Develop a personality check list.		2. Realizes that sexuality is an integral part of one's personality and can be expressed in a wholesome manner.
3. Discuss importance of establishing one's identity.		3. Accepts self, shows growth in discovering self-identity, and demonstrates improvement and consistency in identification of one's real self with various groups and in various situations.
4. Creative Writing: "Who Am I?" (A short autobiography about self-identification. Information to be kept in confidence by teacher.) Utilize this technique to help pupils understand the importance of self-discovery in answering the question "Who Am I?"		
5. Show the film *How Are You?* and discuss.	AUDIO-VISUAL: 10a	
6. Role-play the actions of an immature and a mature person in given situations.		4. Realizes the importance of a wholesome personality in achieving popularity and respect.
7. Plan a panel discussion on the importance of physical fitness, proper health practices, good grooming, and sound human relationships to the development of a wholesome personality.	PRINTED: 21a, 21b	5. Realizes that many factors can affect one's personality.
8. Panel Discussion: "What Is Meant by the Self-Image (as you see yourself), Self-Identity (as you really are), and Popularity (as others see you)?" "What Characteristics Make a Person Liked and Respected?" "Does Physical Beauty in a Girl and Strong Physique in a Boy Assure Popularity?"		6. Shows growth in self-improvement (physical and mental).
		7. Realization of socially acceptable ways to prove masculinity or femininity.
		8. Shows growth in accepting socially approved masculinity and femininity roles.

3453 A

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCE
8. Sexual feelings are natural and can be controlled without harm to health or personality.	9. Review basic human needs. Examine how one's personality can be affected when such needs are met or unmet.	PRINTED: 3, 20a AUDIO-VISUAL: 8a
9. Fluctuations of moods and feelings are natural during adolescence.	10. Panel Discussion: "What Are Some Reasons Why Individuals Behave in Various Ways?" Examples: Self-centered, generous, considerate or inconsiderate, secure or insecure, exploiting others, and engaging in promiscuous sexual behavior.	
10. Control of emotions, including the sex drive, helps prepare one to deal with problems constructively.	11. Explore the meaning of mental and emotional health. Apply findings to ways of meeting and coping with one's problems.	PRINTED: 25a AUDIO-VISUAL: 8a
11. Proving masculinity or femininity through promiscuous sexual behavior, besides damaging another individual, can be harmful to the self-image, and may affect one's personality.	12. Examine appropriate ways to express one's sexuality.	AUDIO-VISUAL: 3c
	13. Discuss similarities and differences in the masculine and feminine roles.	AUDIO-VISUAL: 3d,
	14. Committee Assignment: "Ways to Correct a Weakness or a Fault."	
	15. Discuss meaning of promiscuous behavior. Explore questions such as "Why Do Some People Feel a Need To Prove Their Masculinity and Femininity by Sexual Activity?" and "What Are Positive Ways To Express Masculinity and Femininity?"	PRINTED: 4, 25a
	16. Make a survey of available sources where help with problems can be secured.	
	17. Make use of a question box. (Preview for relevance and appropriateness.)

Goal II: To understand the nature and purpose of the family as the basic unit in society a its members

Concept B: Family's role in human sexuality

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. Families provide an environment in which children grow and mature until they become independent.	1. Develop vocabulary as needed.	
2. The family is a basic setting for human development and a laboratory for acquiring skills of human relationships.	2. Examine the meaning of "family life cycle." Briefly examine the various stages such as those recommended by the American Social Health Association: (a) newly married couple, (b) expectant parents, (c) parenthood (first child), (d) the crowded years, (g) the launching years, (h) the empty nest, and (i) the aging years. Describe the characteristics of an individual who is in the stage related to adolescent years; compare to earlier and later stages.	PRINTED: 18b, 18c AUDIO-VISUAL: 6a
3. Self-identity is acquired in the family setting.		
4. The family framework provides opportunities to express and to control one's emotions.	3. Creative Writing or Panel: "What Should Parents Expect of Me as I Become Independent?" Discuss meaning of independency and dependency in achieving maturity.	AUDIO-VISUAL: 1b, 6
5. The family life cycle consists of a pattern of the growth stages of its members; it is common to all families.	4. Examine ways in which the family helps one achieve self-identity and trust and also ways in which the family can help meet the basic human needs of its members.	
6. Family rules and policies change as members of the family grow and mature.	5. Plan a "Be Nice to Parents Week" without parents knowing it. Report results to class. Select those which demonstrate good human relations.	
7. There are ways to help solve individual and group problems within the family setting.	6. Study the kinds of love which are a vital part of family life such as parental love, sibling love, married love, and sexual love.	AUDIO-VISUAL: 6a
8. Families have adjustments to make and all members must work toward satisfactory solutions or		

3455

ure and purpose of the family as the basic unit in society and the roles played by the family and

han sexuality

LEARNING EXPERIENCES	RESOURCES	EVALUATION
1. Develop vocabulary as needed.		1. Understands the relationship between dependent and independent behavior.
2. Examine the meaning of "family life cycle." Briefly examine the various stages such as those recommended by the American Social Health Association: (a) newly married couple, (b) expectant parents, (c) parenthood (first child), (d) the crowded years, (g) the launching years, (h) the empty nest, and (i) the aging years. Describe the characteristics of an individual who is in the stage related to adolescent years; compare to earlier and later stages.	PRINTED: 18b, 18c AUDIO-VISUAL: 6a	2. Understands role and responsibility in the family. 3. Understands need for behavior guidelines and limits. 4. Appreciates importance of setting a good example for younger family members.
3. Creative Writing or Panel: "What Should Parents Expect of Me as I Become Independent?" Discuss meaning of independency and dependency in achieving maturity.	AUDIO-VISUAL: 1b, 6a	5. Realizes the role of family in meeting an individual's needs.
4. Examine ways in which the family helps one achieve self-identity and trust and also ways in which the family can help meet the basic human needs of its members.		6. Demonstrates an awareness of the stages of growth within the family setting.
5. Plan a "Be Nice to Parents Week" without parents knowing it. Report results to class. Select those which demonstrate good human relations.		7. Recognizes that gradual independence from the family is a desirable part of the maturation process.
6. Study the kinds of love which are a vital part of family life such as parental love, sibling love, married love, and sexual love.	AUDIO-VISUAL: 6a	8. Recognizes that families differ in many ways.

3455A

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES	EVALUATION
adaptations; students should be aware that youth has a responsibility.	7. Role-play: "Ways To Meet and Solve Individual and Group Problems Within the Family Setting."	AUDIO-VISUAL: 1b	
. Accepting responsibility and having respect for authority within the family, according to age and ability, are basic to family stability.	8. Discuss need for changes in family policies as one grows and matures. Discussion Questions: (a) Why is it important to have family rules and regulations? (b) What limits or guidelines should be set by the family for young adolescents?	AUDIO-VISUAL: 1b	
. The behavior of each family member influences the quality of family life for all family members.	9. Examine the role and responsibility of the family in child bearing, rearing, protection, security, and authority.	AUDIO-VISUAL: 6a, 9d	
. Families differ in customs of modesty and in providing for privacy of members.	10. Committee Topics: (a) "The Characteristics of an Ideal Family." (b) "Factors Which May Prevent a Family from Achieving These." (c) "How a Family Can Make Adjustments and Adapt to Changing Conditions."		
. Attitudes formed in the family setting regarding marriage, love (including sexual love), respect for others, and respect for oneself as a total human being affect one's relationship with the other sex.	11. Explain that family planning may include limiting, increasing, or spacing number of children; also, that medical and nonmedical assistance is available to husband and wife from professional sources. (Use judgment in presenting types of birth control, including contraceptives. Clear with school and state policy and regulations.)	PRINTED: 9	
. Attitudes toward the total human being as being beautiful, as being obscene, or as being pornographic in nature are developed within the family setting and peer group.	12. Discuss the meaning and process of adoption.	PRINTED: 2	
. Marriage as a social institution is subject to laws and regulations.			
. A stable, happy marriage contributes to strong family life.			

3456

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCE
16. Parenthood is a responsibility and a privilege of husband and wife.		
17. Parents have the freedom of choice to select a method of family planning which is in keeping with their beliefs and with standards of society.		

Goal III: To demonstrate a pattern of relationships based upon insight and understandin to himself and others

Concept C: Effective interpersonal relations

1. Companionship of both sexes in a variety of wholesome activities helps individuals learn to understand others, to enjoy others, and to gain skills in sound human relations.	1. Develop vocabulary that is suitable and needed.	
	2. Panel Discussion Topics: "What Can I Do To Be a Good Friend?" "What Do I Want in a Friend?" "How Can I Get Along with My Friends?"	PRINTED: 20b
2. Broadening the scope of friendships tends to increase understanding of others.	3. Examine ways in which broadening friendships can increase understandings of others, such as helping to choose friends wisely, increasing range of contacts and interests, providing for social enjoyment, and becoming aware of standards of others.	PRINTED: 10, 18a, AUDIO-VISUAL: 6a
3. Dating is a period of becoming better acquainted with members of the other sex.		
4. Behavior in dating can affect interpersonal relationships now and at a later time in life.	4. Panel Discussions: (a) "Group and Double Dating Versus Single Dating." (b) "Qualities to Look for in a Date." (c) "How To Ask for, Accept, or Refuse a Date." (d) "Appropriate Activities on a Date." (e) "Standards for Dating Behavior." (f) "Importance of Similar Interests and Hobbies in Dating Groups." (g) "What Opposite Sex Looks for,	PRINTED: 1, 18a
5. Understanding of parent's concern for dating practices is a sign of maturity and respect.

Expects, or Dislikes in Terms of Behavior."		
5. Study emotions, their control and expression.	PRINTED: 1, 9 AUDIO-VISUAL: 9c, 9h	5. Demonstrates an understanding of the differences in stimulation and expression of the sex drive in a boy and in a girl.
6. Discuss differences in sexual feelings and desires of boys and of girls. Apply to such activities as necking, petting, and sexual stimuli.	PRINTED: 7, 9, 20b AUDIO-VISUAL: 6a	6. Realizes that the ability to make wise choices of sexual behavior and to accept responsibility for one's behavior shows growth toward maturity.
7. Panel Discussion: (a) "Does Physical Expression of Affection Always Lead to Sexual Feelings and Desires?" (b) "How Does Choice of Behavior Show Maturity or Immaturity?" (c) "What Is Meant by Sexual Exploitation of Another?" (d) "Why Are Parents Concerned About Dating Behavior?" (e) "What Is the Meaning of the 'Single' and 'Double Standard' in Relation to Sexual Behavior of Both Sexes?"	PRINTED: 4, 7, 9 AUDIO-VISUAL: 6a	7. Realizes the importance of developing sound friendships and good human relationships.
8. Discuss the effects of responsible and irresponsible sexual behavior on oneself and others, the importance of self-respect, and concern for others as a factor in making wise decisions and choosing alternates.	PRINTED: 4, 9, 10	8. Realizes that premarital sexual relationships may cause problems to self and to others.
9. Discuss appropriate and inappropriate sexual behavior.	PRINTED: 20b	9. Understands that concern for self and respect for the other person determine actions in a dating situation.
10. Write your definition of promiscuous behavior.		
11. Brainstorm: Problems associated with premarital sexual relations such as fear, guilt, shame, lack of trust, disruption of long-range goals and plans, pregnancy, abortion, unsuitable early marriage, illegitimate children, and responsibility of both parties in caring for the child.	PRINTED: 4, 9	

3458

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES	EVALUATIO
4. Full expression of sexual love is best reserved for marriage.	12. Discuss love as a basic human need. Note the many ways it is expressed such as parental love, sibling love, friendship, "puppy love," "crush," romantic love, sexual love, and married love.	PRINTED: 9 AUDIO-VISUAL: 6a	
5. Behavior sets an example to peers and young children.	13. Study the differences of love for a friend, love of work or a hobby, romantic love, and married love.		
	14. Brainstorm: "How Do Values and Standards of the Family, Peer Group, Friends, Religion, and Society Affect Sexual Behavior and Attitudes?"	PRINTED: 7 AUDIO-VISUAL: 3e	
	15. Discuss transitory nature of childish relationships as compared with long-term relationships. Relate to personalities who have not learned adult long-term relationships.	PRINTED: 10, 20b	
	16. Develop a set of behavior guidelines and the need for self-discipline and control in following them.		
	17. Explain meaning of heterosexual and homosexual relationships.	PRINTED: 4, 24a	
	18. Discuss qualification of friends, how friends are chosen, the effect of friends on one's behavior, and qualities that lead to mature friendships. Discussion Questions: (a) "What Is Popularity?" (b) "Is One Abnormal If Not Interested in Dating or Going Steady?"	PRINTED: 10, 20b	

Teacher Information

Relative to heterosexual and homosexual relationships avoid generalizations, deductions, or confusion about wholesome friendships of the same sex as compared with homosexuality.

Goal IV: To understand the influences on sexuality of political, philosophical, religious, customs, and laws in a pluralistic society

Concept D: Factors affecting societal values on sexuality

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURC
1. Under various forms of government, an individual's rights and responsibilities differ.	1. Contrast the freedom of individuals in an authoritarian form of government with a pluralistic democracy such as ours. Explore the following: a. How does our society protect the rights of the individuals? b. Explain the statement that "For every right there is a responsibility." c. How do the responsibilities and rights of individuals relate to choice of one's sexual behavior?	
2. Our society includes many types of cultures.	2. Study dating, engagement, and marriage customs in various countries and cultures. (Use American Field Service students or servicemen's wives as sources of information.)	
3. Patterns of sexual behavior differ among individuals, countries, groups, and cultures.	3. Study the influences that various people such as parents, other adults, siblings, peers and friends, and cultural groups have on one's behavior.	
4. Sensitivity to differences in people and their customs helps one understand them.	4. Study influences of mass media and advertising on one's sexual behavior.	
5. Culture and religious beliefs may have an effect on one's behavior, including sexual behavior.	5. Discuss current movies, music, or television programs relative to their effect upon attitudes and behavior.	
6. Dating, engagement, and marriage customs vary from one country to another and from one culture to another.	6. Have students read appropriate short stories recommended by the language arts department.	
7. Many factors and forces influence the status of the family.	7. Examine forces and pressures which affect families and cultures in our society. Have groups of students	PRINTED: 7, 22a,
8. Overpopulation and population control are world-wide problems.		

3460

influences on sexuality of political, philosophical, religious, and cultural ideologies including beliefs, n a pluralistic society

societal values on sexuality

LEARNING EXPERIENCES	RESOURCES	EVALUATION
1. Contrast the freedom of individuals in an authoritarian form of government with a pluralistic democracy such as ours. Explore the following: a. How does our society protect the rights of the individuals? b. Explain the statement that "For every right there is a responsibility." c. How do the responsibilities and rights of individuals relate to choice of one's sexual behavior?		1. Realizes the influence of the church, peer group, and other forces on one's philosophy and sexuality. 2. Present a specific problem such as "Advertising Affects Behavior" and have students write about ways advertising can affect behavior.
2. Study dating, engagement, and marriage customs in various countries and cultures. (Use American Field Service students or servicemen's wives as sources of information.)		
3. Study the influences that various people such as parents, other adults, siblings, peers and friends, and cultural groups have on one's behavior.		
4. Study influences of mass media and advertising on one's sexual behavior.		
5. Discuss current movies, music, or television programs relative to their effect upon attitudes and behavior.		
6. Have students read appropriate short stories recommended by the language arts department.		
7. Examine forces and pressures which affect families and cultures in our society. Have groups of students	PRINTED: 7, 22a, 22b	

GENERALIZATIONS	LEARNING EXPERIENCES	RE
	construct a 3-foot by 4-foot poster or montage. The only instructions should be to "put on the poster what you think society is and what your problems in society are." Each group should interpret its poster.	
	8. Discuss the influences on the family of working mothers, mobility of population, and industry moving families at regular intervals.	

Goal V: To develop and employ a personal code of ethics which recognizes that groups and individuals within a pluralistic society

Concept E: A code of personal sexual behavior as part of a total value system

1. Societal values are desirable or worthy for the preservation of civilization; goals and standards are influenced by values.	1. Have each student develop a statement on a value and show how this value can affect his sexual behavior. Example: "I Believe That Sex Is . . ." or "Why I Support the Golden Rule." (Statements can be anonymous.)	PRINTED
2. Personal values are gained from many sources and may change throughout life.	2. Explore ways personal values are gained through direct and indirect methods and sources such as home, church, community, and peers.	PRINTED AUDIO-V 6a
3. Values and standards apply to all human relationships, including sexual behavior.	3. Study and demonstrate the steps in the decision-making process. Example: identification of problem, research, and solution or decision.	
4. Selection of standards reflects values and influences behavior; also values have meaning in how we deal with one another.	4. Present several "open end" problem situations regarding decision making and have students suggest solutions. (Use case histories.) Analyze consistency and choice of alternatives and values.	PRINTED
5. Decision making involves many factors; making wise decisions is a sign of maturity.	5. Analyze values presented in a recent movie, book, or television program.	AUDIO-V

LEARNING EXPERIENCES	RESOURCES	EVALUATION
Note agreement, disagreement, and ability to select values.		6. Shows growth in recognizing problems and securing help from trustworthy sources.
6. Brainstorm: "How Do 'Models' or Persons You Admire Influence Behavior?"	PRINTED: 1, 10, 23a	
7. Explain the meaning of a personal philosophy. Ask each student to write his. Summarize by relating a philosophy of life to values and standards.	PRINTED: 13, 14, 15	
8. Panel Discussion Topics:	AUDIO-VISUAL: 3f	
a. "What Are Guilt Feelings?"		
b. "Should Boys and Girls Have Different Standards of Sexual Behavior?"		
c. "Do You Have a Responsibility for Other Members of Society?"		
d. "Do Values and Standards of Famous People Have an Effect on Your Life?"		
e. "Why Do Values and Standards of People Differ?"		
9. Discussion Topic: "Why Do I Act the Way I Do?"		
10. Creative Writing: "The Kinds of People I Admire and Why" or "My Most Unforgettable People." Analyze their characteristics.		
11. Develop a set of standards to guide sexual behavior in a positive, constructive manner.	PRINTED: 1, 9, 20b AUDIO-VISUAL: 3a	
12. Topics for Committee Work and Panel Discussion:	PRINTED: 10, 13, 20b	
a. What is the difference between immediate and long-range goals?		
b. What is meant by responsible sexual behavior?		

3462 A

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
	c. What is meant by choosing alternatives and acceptance of consequences of behavior?	
	d. What is involved in correcting a mistake?	
	e. Demonstrate process of solving a problem.	
	13. Creative Writing: "What Do I Want To Do and Be?" (Statements can be anonymous.) Note: Cooperate with language arts department.	
	14. Panel Discussion: "How Can I Help Others Realize Their Goals and Aspirations?" (This discussion includes a review of the basic human needs and how one can help others.)	PRINTED: 10, 14 AUDIO-VISUAL: 9g

Goal VI: To accept a personal responsibility for positive and constructive influences on socie sexuality

Concept F: Individual obligation and group responsibility regarding family living

1. Participation in wholesome school and community activities is a sign of responsible citizenship.	1. Make a survey of valuable or suitable school and community activities which give one an opportunity to carry responsibilities and leadership. Examples: recreation, 4-H, YMCA, or YWCA.	
2. Each one has a responsibility to help make the community a healthy place in which to live.	2. Discuss meaning of deviant behavior. Explain that deviant behavior does not only involve sexual behavior. Include the meaning of homosexuality, rape, exhibitionism, and child molesting.	PRINTED: 4, 10, 24a
3. In addition to being a private and personal matter, sexual behavior also carries public responsibility.	3. Examine ways to deal with individuals who show deviant sexual behavior. Invite a resource person such as a social worker or Mental	
4. Inappropriate and unhealthful sexual

GENERALIZATIONS	LEARNING EXPERIENCES	RESO
	ships Show Positive Values and Constructive Use of One's Sexuality?"	
	Teacher Information	
	Teacher should use judgment in discussing homosexuality as it is natural for boys and girls to feel friendly toward the same sex. Also, judgment should be used in describing characteristics or differences in appearance of a homosexual.	

Goal VII: To employ suitable and effective communication about human sexuality

Concept G: Effective communication

GENERALIZATIONS	LEARNING EXPERIENCES	RESO
1. Correct and proper vocabulary facilitates verbal communication.	Note: It is recommended that the development of a proper vocabulary should be a part of the specific learning experience to which the words pertain rather than an isolated and separate skill.	
2. The beauty and goodness of the total human being can be expressed in many ways.	1. Develop appropriate vocabulary for all areas. Check on knowledge and usage of vocabulary by written tests, questions and answers, and discussions.	
3. Sexuality may be expressed in verbal and nonverbal ways.	2. Contrast the meaning of beauty and truth in the arts to the purpose of pornographic and obscene material.	
4. The family setting serves as a laboratory for learning communication.	3. Examine verbal ways to express one's sexuality.	PRINTED: 8 AUDIO-VISU
5. Words are often assigned to build a slang or double meaning vocabulary; meanings of words may change.	4. Examine nonverbal ways to express sexuality such as manners, dress, behavior, and treatment of and relationships to others.	PRINTED: 6
6. Sexual feelings can be stimulated and aroused through the senses.	5. Give examples of direct and indirect sl[illegible]motions based on sex.	

3465

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
7. Obscene and profane words directed at a person may be used as a weapon to cause injury or to express anger; they may result in hostile or aggressive behavior.	6. Panel Discussion: "Effect of Mass Media on One's Standards, Behavior, and Sexual Feelings."	
	7. Discuss good and poor qualities of movies, books, recordings, and television.	
8. Some sale promotions are based on sex and may directly or indirectly affect attitudes toward sex. They are often genital centered.	8. Question: "Do Actions Speak Louder Than Words?"	
	9. Dramatize various means of communication such as speech and manners.	
9. Open communication among groups or individuals provides for interaction, testing of ideas, and a process for growth.		

Goal VIII: To understand anatomical, physiological, psychological, and sociological maturati

Concept H: Human growth and development

1. Adolescence is that period of growth when one moves from childhood to adulthood; puberty marks the onset of adolescence.	1. Explain that growth patterns vary for individuals, but all go through the same stages in an orderly sequence. All parts of the body grow and change, but not at the same rate.	PRINTED: 10, 20b, 21a, 2 AUDIO-VISUAL: 6a, 7a
2. Many changes in the physical, psychological, and sociological development of boys and girls occur during adolescence; these changes proceed in an orderly fashion, alternating between fast and slow.	2. Discuss the growth changes for boys and for girls which take place during adolescence, including the secondary sex characteristics, awakening of sexual feelings, and interest in the other sex.	PRINTED: 10, 20b, 21a, 2
3. Individuals grow and develop at varying rates.	3. Study the growth changes which characterize puberty such as physiological readiness for a boy to become a father and a girl to become a mother.	

3466 A

3466

LEARNING EXPERIENCES	RESOURCES	EVALUATION
Panel Discussion: "Effect of Mass Media on One's Standards, Behavior, and Sexual Feelings."		7. Awareness of the difference between art, pornography, and obscenity.
Discuss good and poor qualities of movies, books, recordings, and television.

	26. Review ways a marriage can be terminated such as legal separation, divorce, and other means. Consider ethical, social, and religious beliefs of parties concerned.	PRINTED: 2	
	27. Review case studies of early marriage; discuss factors which contribute to the success and failure of such marriages.		
	28. Assign reading and research materials on factors which affect success and failure in marriage. Follow with a discussion on the pros and cons of marriage where individuals have similar and dissimilar backgrounds.	PRINTED: 1, 2, 12, 16, 34a	
	29. Brainstorm Session: "How May Early Marriage Affect One's Immediate and Long-Range Goals?"	PRINTED: 2	
	30. Conduct Research on the Questions: (a) "What Are the Chances That an Early Marriage Will Be Successful?" (b) "Unsuccessful and Why?" (c) "Why Is Society Concerned About Early Marriages?"	AUDIO-VISUAL: 2a, 8g	
	31. Discuss the importance of individuals who plan marriage attending a premarital counseling course or premarriage course.	AUDIO-VISUAL: 2e	
	32. Case Studies: "Should They Get Married?" (List a number of circumstances and have class make the decision.)		
	33. Creative Writing: "What Is a Marriage?"	PRINTED: 1, 2	

Goal IV: To understand the influences on sexuality of political, philosop liefs, customs, and laws in a pluralistic society

Concept D: Factors affecting societal values on sexuality

GENERALIZATIONS	LEARNING EXPERIENCES
1. Political, philosophical, religious, and cultural beliefs influence patterns of sexual behavior.	1. Review the various forms of political ideologies. Compare them with a democratic pluralistic ideology in regards to existing laws related to sexual behavior. Examples: abortion laws, marriage laws, population control and birth control, and deviant sexual behavior. (Examine reference materials.)
2. Examination of various individual and societal beliefs relating to sexual behavior will increase a person's understanding of the need for a personal code of behavior to assist in adjustment to societal influences and demands.	2. Debate the existing laws related to sexual behavior.
3. Varying religious beliefs affect standards of sexual behavior.	3. Examine philosophical beliefs apparent in a society and the effect on an individual's personal philosophy of life and development of personal value system. Example: identification and knowledge of the various beliefs of sexual behavior such as asceticism, humanism, or anarchy.
4. The family system is interrelated with and affects other parts of the culture; other parts affect the family in terms of economic, religious, political and familial; if one system changes, the others are affected.	4. Explain how varying religious beliefs determine standards of sexual behavior. (Resource people may be used. The Minnesota Council of Churches, 122 W. Franklin Avenue, Minneapolis, Minnesota 55404, will provide information.)
	5. Debate for or against censorship in the area of sexual information or misinformation.
	6. Study cultures and subcultures in society to better understand different standards of conduct in sexual behavior. Examples: double and single standard, identification of subcultures, and social class and religion.

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCE
standards, and rights of others.	Beyond an Individual's Control Determine His Behavior?" (Example: A boy may be responsible for his girl friend's pregnancy but may not want to accept responsibility for his actions.)	
3. An individual who has developed a personal system of values is willing to make sacrifices to progress toward accepted goals which are in harmony with such values.	4. Small Group Discussions: (a) "What Factors Are Involved in Decision Making Regarding Sexual Behavior?" (b) "What Social Pressures Operate To Influence Sexual Expression?"	PRINTED: 4, 8, 14, 3 AUDIO-VISUAL: 1c,
4. In a democratic pluralistic society, one has the responsibility to recognize the right of individuals to adopt and follow different codes of ethics.	5. Panel Discussion: (a) "What Is Morality? Does It Change?" (b) "How Do Self-Integrity, Values, and Respect and Concern for Others Affect One's Moral Judgments in Regard to Sexual Behavior?" (c) "Contrast Moral and Immoral Behavior." (d) "Ways To Handle Conflicting Value Systems."	PRINTED: 30 AUDIO-VISUAL: 1a,
5. Any rules or standards of behavior should protect the individual's right to question them. Realistically, rules will sometimes be broken and standards sometimes will not be upheld. It must be recognized that an individual's mental stability frequently depends upon being able to rationalize behavior which is contrary to rules and standards.	6. Review and analyze current movies regarding effect upon values.	
6. Moral behavior implies that all relationships between people should be meaningful, substantial, and mutually valued.	7. Discuss the hedonistic point of view advocated by Hugh Hefner.	PRINTED: 14
7. Signs of maturity are meeting problems, making decisions, facing and dealing with guilt, and accepting responsibility.

Goal VI: To accept a personal responsibility for positive and constructive influences on society's co sexuality

Concept F: Individual obligation and group responsibility regarding family living

GENERALIZATIONS	LEARNING EXPERIENCES	RESOURCES
1. Each individual as a member of a family, community, state, and nation has a responsibility for raising issues and coping in a constructive manner with worldwide problems of sexuality. These include moral standards, population control, sexual exploitation, sexual deviancy, venereal disease, illegitimacy, family breakdown, abortion, and legal regulation of sexual behavior.	1. Assign a research committee to report to class on the responsibilities that individuals and society have in coping with issues and problems such as (a) population control and explosion, (b) abortion, (c) venereal disease, prevention and control, (d) contraception, (e) prostitution, (f) illegitimacy, and (g) family breakdown.	PRINTED: 23, 35a, 36a, 36b, 37a AUDIO-VISUAL: 2g, 9b
2. Health, education, welfare, religious, and medical programs, official and nonofficial, have a responsibility to provide services for individuals with needs and problems, including those dealing with sexuality and family living.	2. Seminar Discussion: (a) "How Can People Be Helped To Take Responsibility for Facing and Solving These Problems in Our Society?" (b) "How Can Education Help?"	
	3. Justify: (a) "Sexual Behavior Is a Matter of Public Concern as Well as a Private Matter." (b) "Whose Business Is My Behavior?" (c) "What I Do Is My Own Business."	
	4. Creative Writing: "What Are the Implications of Irresponsible Sexual Behavior?"	
	5. Question: "What Contributes to Deviant Behavior?"	
3. An understanding of the misuse of sexuality helps one to protect himself and others against exploitation by others and injury to physical, emotional, and moral health.	6. Independent Study: "What Social and Governmental Institutions Should Have Responsibilities and What Should They Do in Regard to Meeting Needs of Individuals in the Area of Family Life and Sex Education?"	PRINTED: 3
4. Use of alcohol and drugs influences human behavior, including sexual behavior.	7. Survey resources in the school and community — such as a psychiatrist,

	marriage counselor, mental health center, and social service agency — where individuals can secure help with problems relating to sexuality.		
	8. Invite resource people from various agencies of family living to discuss functions, responsibilities, and problems of the family in our society and to outline the assistance that is available to families in need.		
	9. Round Table Discussion: (a) "Where, How, and by Whom Should Sex Education Be Taught in Schools?" (b) "What Are Assets and Limitations of Such a Program?"		
	10. Group Project: Plan a program of family life and sex education for a school, K-12, showing a sequential pattern of study in terms of student needs.		
	11. Group Project: Have students evaluate their school education program in family life and sex education.		
	12. Investigate laws in the state regarding rape, incest, exhibitionism, homosexuality, and other sexual behavior.		
	13. Questions: (a) "Are the Laws Fair Regarding Sexual Behavior?" (b) "Can Sexual Behavior Be Legislated?" (c) "What Are Rights of Individuals in Our Society in Contrast to the Common Good?" (d) "Where Does Decision Making Lie?" (e) "Is Sexual Deviancy Criminal Behavior?"		
	14. Invite resource personnel to discuss effect of alcohol and drugs on one's behavior, including sexual behavior.	AUDIO-VISUAL: 2d	

3488

Goal VII: To employ suitable and effective communication about human sexuality

Concept G: Effective communication

GENERALIZATIONS	LEARNING EXPERIENCES	RESO
1. Effective communication may be verbal or non-verbal.	Note: It is recommended that the development of a proper vocabulary should be a part of the specific learning experience to which the words pertain rather than an isolated and separate skill.	
2. Utilization of correct terminology in the area of human sexuality can be a strengthening factor for respect of self and others.	1. List methods of verbal and non-verbal communication such as art appreciation, sense of humor, and pornography. Analyze stories in magazines and interpret music of teenagers.	
3. Verbal and nonverbal techniques are powerful tools for use in reacting to others.	2. Review court decisions on pornography and obscenity.	
4. Effective communication between individuals is of primary importance in preventing serious problems.	3. Discuss: "Why Are 'Dirty' or 'Off-Color' Jokes Told?"	
5. Failure of youth and adults to communicate about problems and needs is caused by a lack of openness, receptivity, and honesty about sexuality.	4. Discussion Topic: "The Role of Modeling (setting example) in Sexual Communication."	
6. Participating in gossip, spreading rumors, or spreading information about sexual behavior of a person as a result of hearsay, observation, or deduction of behavior can cause serious damage to a person's reputation.	5. Buzz Group Topic: "The Importance of Free and Honest Communication in Interpersonal Relations Relative to a Couple's Responsibility to One Another."
